act honored by the audible or visible presence of each Person in the Trinity when Jesus was baptized; honored in this respect as was no other act of obedience in our Lord's life. The so-called "Teaching of the Apostles" does not call anything baptism but immersion. It gives directions for baptism, and then, when the conditions of baptism are wanting, although we find them always possible, it gives permission for something else, not called baptism. This "teaching" Baptists alone live up to; it is especially their document. Their views the highest scholarship indorses. Lexicographers such as Donnegan, Schleusner, Greenfield, Stourdza, Liddell and Scott, Robinson, Wahl, Grimm, Wilke, and many more distinctly and emphatically affirm that baptize, which is properly a Greek word, means to dip, to immerse, to plunge. Such religious teachers as Calvin, Luther, Melancthon, Archbishop Leighton, Wesley, Conybeare, and Dean Stanley say that immersion was the original mode. Such commentators as Chalmers, Zwingle, Ewald, De Wette, Meyer, Godot, Alford, Plumptre, Bishop Elliott, and many more, representing various churches and countries, say in substance that same thing. Such historians of our Lord's ministry and of the apostolic church as Mosheim, Neander, G. A. Jacobs, Geikie, Pressensé, Conybeare and Howson, Lewin, Dean Stanley, Edersheim, Farrar, Weiss, Hagenbach, and Dollinger, and such recent learned theologians as Luthardt, Van Oosterzee, Schmidt, Dorner, and Rothe, agree substantially with the learned Dr. Schaff when he says, "Immersion, and not sprinkling, was unquestionably the original form." Luther, Dr. Wall, Neander, Olshausen, and Professor Lange agree with Dr. Hanna when he says, "Scripture knows nothing of the baptism of infants." If scholarship can prove anything, it has established the Baptist position regarding the subjects and the act of baptism.

The point I make is this: All are agreed on immersion as baptism; all cannot agree on anything else. All can be baptized without doing violence either to conviction or to conscience. High Roman, Episcopal, Presbyterian, and Methodist and other authorities can be cited — and their exact words given — to prove all these statements regarding the teaching of the highest scholarship; and the plain teaching of the Bible to the unlearned is in harmony with the conclusions of the highest scholarship. Baptists have no option but to be separate so long as others refuse to follow Christ in baptism. If a pastor in any of the churches not Baptist were to teach and practice our views, he would be driven out. What then could he do but be separate from his former brethren? If others than Baptists will not do what conviction and conscience permit them to do, it is certain that they do not much desire union. Surely in such a case the charge of bigotry and schism does not lie at the door of Baptists. We shall continue to pray, "that they all may be one, as thou, Father, art in me, . . . that the world may believe that thou hast sent me."

R. S. MacArthur.

CALVARY BAPTIST CHURCH, New York.

American Students in Germany.

Now that multitudes of American college graduates annually migrate to Berlin, Leipzig, Göttingen, and Strasburg, it may not be out of place to call attention

to some widespread misapprehensions concerning the charms and advantages of life in a German university town.

No impression concerning Germany is more widespread than that the cost of living there is exceedingly cheap. This is always a potent argument in deciding students of limited means in favor of life in Germany. This is certainly, however, a wrong impression, as far as it applies to the expenses of the American student in Germany as compared with his expenses at most of our colleges. A few figures will put the facts in the most definite shape. In Leipzig, which is probably the cheapest city in the German empire, the average price of the boarding-houses which rank as good — though their fare would be counted rather scant and poor in America — is about twenty-five dollars a month, for room, fuel, and board. In Berlin the best boarding-houses set somewhat better tables than those of a corresponding grade in Leipzig, but their prices are much higher.

Many German students, it is true, subsist upon much less, but how they do so must be to an American an insoluble mystery, unless there be a marvelous potency of nourishment in beer. There are also Americans who keep soul and body together at rates considerably lower than those mentioned. But in a good many such cases it is perfectly apparent that these students are working with only half their native force. The writer is cognizant of several cases in which men broke down entirely either during their stay in Germany or shortly after their return, their failure of health being almost unquestionably due to lack of proper diet and self-care while abroad. Cheap German living is not adapted to an American constitution.

As far as the social life of Germany is concerned, the American student must in the main content himself with an outside view. The ideal German household into which he is to be received as one of the family, and whose members are to devote themselves to teaching him the language, is a pure illusion, or at best a boarding-house where he joins with a tableful of his countrymen in speaking poor German. In fact, the presence of a host of English-speaking people in every prominent German city is a serious hindrance to the facility with which the American might otherwise learn the language and assimilate himself to the manners and customs of the country. It is probably better, however, to submit to this hindrance than to refuse, as some do, to mingle at all with those who speak English; for, in so doing, one loses the opportunity to become acquainted with many of the finest representatives of English and American learning. The students who gather from America and England in Göttingen, Leipzig, and Berlin, are, in the main, a choice representative company. Not even in America itself can one gain so comprehensive a view of the educational work of our nation, as by mingling in a German university town with students from almost every State of the Union.

A great mistake of fully half the American students in Germany is that they have fixed upon no definite department of study before coming, or, if they have done so, have not prepared themselves sufficiently at home to undertake it to advantage in the university. As is well known, the German student, *on entering* the university, decides what his profession is to be, and se-

lects his studies accordingly. The thorough drill of the *Gymnasium* or *Realschule* has fitted him for the independent study demanded of him in the university.

Now the American just out of college has not only the difficulty of the language to cope with; he finds fully as great a difficulty in the lecture system and in the use of books of reference. He has had no adequate training for the work he must do, and he is pretty sure to end his first semester, if not his first year, in a state of almost hopeless confusion.

I think no American can listen to many courses of lectures in a German university without becoming convinced of the superiority of the better class of American college professors in the art of *instruction*. Except in the occasional interviews of the *Seminar*, the German professor has none of that training which comes from meeting the intelligent questions of a clever class. An American professor learns in the course of a few years' experience to feel the pulse of his class, as it were, and to know in an instant whether he has made himself understood. Many of the most famous German professors, on the other hand, elaborate with tedious detail the simplest matters, and sometimes merely hint at the explanation of real difficulties. They are for the most part closely confined in their lectures to what they have carefully prepared beforehand, and any occasion to think or to answer on the spur of the moment is pretty sure to throw them into confusion. With some brilliant exceptions, remarkable for their clearness, systematic arrangement, and beauty of language, they pay no attention to the "art of putting things," their style frequently being execrable.

One thing that greatly annoys the American student in Germany is the lack of such library privileges as he can enjoy in the best colleges at home. Not but that the German libraries are very large and complete, but their availability is so limited by various restrictions as well as by the lack of comprehensive and accessible catalogues, that in despair many American students soon give up trying to obtain books.

I have purposely spoken only of certain disappointments and disadvantages which the American student is likely to experience in Germany. Of the delightful sensation of personal freedom from all rules and restraints, and the powerful inspiration to independent study which he also experiences, as well as of the enormous debt of gratitude which American scholarship owes to the German university, it is needless to speak — as, indeed, it would be difficult to speak in too glowing terms.

Morris B. Crawford.

Photography and American Art.*

THERE is a great deal that is worth watching in American Art at the present time; and one of these things is the effect of photography upon art,—not merely the effect of the Muybridge revelations, which

*"Book of American Figure Painters," with introduction by Mrs. Schuyler van Rensselaer. Philadelphia: J. B. Lippincott Co.

"The Blessed Damsel," by Dante Gabriel Rossetti, with drawings by Kenyon Cox. New York: Dodd, Mead & Co.

"She Stoops to Conquer," a comedy by Dr. Goldsmith, with drawings by Edwin A. Abbey, decorations by Alfred Parsons, introduction by Austin Dobson. New York: Harper & Bros.

"A Book of the Tile Club," with sketch of the club, by F. Hopkinson Smith and Edward Strahan. Boston: Houghton, Mifflin & Co.

"The Art Review," Vol. I. Nov., '86, to May, '87. New York: George F. Kelly, 59 Carmine street.

though of great value may easily be overdone as assistants to the artist; not merely the general and undoubted effect of all photography from nature—an effect extended and made more intimate by the spread of amateur photography; not merely the general diffusion of art instruction and influence by means of photographic copies of the old masters, etc.; not merely the great and important use of photography in wood-engraving, but also the growing use of photography in various reproductive methods, and the effect of their use upon illustration in particular, and upon current art in general.

The success of Elihu Vedder's "Omar Khayyâm," and of William H. Low's "Iamia" in previous years, was the occasion of such volumes in the last season as the "Book of American Figure Painters," and Kenyon Cox's "Blessed Damsel";—possibly such success may also have had something to do with the book form in which Edwin Abbey's illustrations of "She Stoops to Conquer" were brought out. These photographic processes have, therefore, become a strong factor in American art development, and have given the opportunity to publishers to employ our better artists upon continuous series of congenial subjects; as well as to present to the public good-sized reproductions of unrelated original designs, either made for the purpose or already completed, as in the "Book of American Figure Painters." This volume, though its pictures are not of uniform merit, deserves the attention of the connoisseur. Kenyon Cox has not yet surpassed his "Evening" in this collection. Here, too, are Dewing's exquisite "Days," Winslow Homer's "Lost on the Grand Banks," and Bunker's "Dozing Tar"—with examples of La Farge, Wyatt Eaton, Vedder, Julian Weir, Eastman Johnson, Volk, Dielman, Shirlaw, Millet, Chase, and other painters of ability. A better collection is easily imaginable,—but single pictures in this gallery are worth the cost of the whole sumptuous volume. The "Blessed Damsel" of Cox, it is natural for each critic to assume, is not the "Blessed Damsel" of the poet; and we find moreover, in this series, that tendency to stick too closely to the model, which is this artist's danger; but we find also a keen and unusual decorative and pictorial sense, as well as undoubted evidences of imagination. Mr. Abbey is indebted to the actinic, and other processes in which photography comes into play, in the preparation of his illustrations for "She Stoops to Conquer," a work as near perfection in its illustrative and artistic qualities in its own line as contemporaneous art can show. The delightfully illustrated "Book of the Tile Club" also owes much of its attractiveness to the photographic processes. If we were not speaking especially of the photographic side of the subject, we should like to enlarge upon the art qualities displayed in the covers of all the four books here mentioned; but instead will call attention to the extremely successful use of the photogravure in the new American "Art Review," whose bound volumes are an invaluable storehouse of current American art.

Notes.

THE NEW ENGLAND EMIGRANT AID COMPANY.

TO THE EDITOR: There are what I regard as grave errors in relation to Kansas, in the life of Lincoln, in your April number, which I would gladly correct in your columns without delay. But you inform me, in your note of the 25th inst., that it would be some time before a reply could appear.

I beg leave, therefore, to say that these errors are partly refuted in some lectures which I gave by request of the Worcester Society of Antiquity. In its "Proceedings for 1886" an abstract of these lectures has been published. A much more full and elaborate refutation will appear in the book which I am now writing, to be called "The History of the New England Emigrant Aid Company, and its Influence, through the Kansas Contest, upon our National History." It is my purpose to have this book ready for the reader by the end of the present year.

Eli Thayer.

WORCESTER, MASS., April 30, 1887.

THE GOVERNMENT OF CITIES.

THE plan of John D. Cutter, in the May CENTURY, to better the government of cities by securing in the City Council members elected by guilds which represent various business interests, to be complete should include a representation from the house-mothers.

The home-makers represent the largest and, in a sense, the most important of all the interests. The women who compose it are preëminently law-abiding and orderly. Their chief occupation is the care of the children and of the family. Hence, all their interests are opposed to everything that endangers the peace and well-being of the whole community.

Any change in the form of city government which looks to its improvement should include women, with the right to vote.

More than thirty years ago Wendell Phillips said, "The suffrage of women has much to do with the government of great cities." Has not the time fully come when it should be brought in as an added power on the side of law and order?

Lucy Stone.

A CORRESPONDENT objects to the phrase, "Treeless and birdless," in a poem on Dakota recently printed in THE CENTURY. He writes that many ten-acre groves have been planted, and that the Territory is noted for its birds.

In the "General Recollections of Louis Blanc," by Karl Blind, on page 80 of the May number, the sentence: "Thiers cast his vote against declaration of war, first, last, and ever," ought to read thus: "Finally, Thiers practically voted for 'the war by way of granting the supplies, like the other members of the Opposition.'"

BRIC-À-BRAC.

Uncle Esek's Wisdom.

VANITY perhaps has made more people polite, and even endurable, than has any one of the virtues.

MAN may not reach perfection, but he can reach for it; this is all that is required of him.

BE a man first, and then you can be a gentleman at your leisure.

WE seem to have four kinds of people: those who are moving forward; those who are on the move backward; those who are standing still; and those who are going to start in some direction soon.

THE strongest intimacies we see are between knaves and fools; a fool never gets higher than to admire cunning in his associate.

THERE is many a heart that dwells in its soul, like a hermit in his cell, its own sad and sorrowing confessor.

IF a man has real merit, there is nothing that will bring him into notice so well as abuse.

THE man who is vain of his wealth only proves that he thinks more of his money than of himself.

THERE are very many people who stand ready to sacrifice their lives, and their neighbors' lives too, in defense of their creed, who are willing to let their religion shift for itself.

A JEST is often a weak and silly thing, a witticism a cold and cruel thing, but a joke is ever the fun of humor.

ALL genuine truth is orthodox.

AS LONG as temptations exist, man will hunt for them.

MENTALLY, morally, and physically, man is composed of all things good, bad, and indifferent; he is a kind of a human rag-bag.

TO BE a good critic, a man must have all the intrinsic elements of a good author; and yet, while we have but few good authors, even the solitudes and waste places teem with critics.

BEWARE of the still man; he is getting your size, and concealing his own.

THE wisdom of the past has come to us in sentences, not pages.

IF it were not for our passions, our reason would be almost impotent.

SUCCESS don't impose itself upon any one; those who win must reach for things, and at the same time cultivate their grip.

ALL the real wits and humorists are a sedate people; their wit and humor is worked out soberly, with line and plummet.

ANY man who has any one of the virtues strongly developed has a coloring of them all in his character.

Uncle Esek.

Our Saint.

THE one I sing was born and bred
Ere proud Queen Fashion's whims had led
A single maid to vex her head

O'er pug or poodle;
Her form was lithe, her face was fair,
Her laugh was blithe and debonair,
Her voice was sweet,—her favorite air
Was "Yankee Doodle."

She used to play an old spinet,
The same is in existence yet
Amid the dust and cobwebs set
High in our garret;
And oft she spun from dawn till gloom
In some quaint, low, be-gabled room;
She loved the fabric of her loom
Nor scorned to wear it.

In stately minuet or reel,
With large-bowed slippers, high of heel,
Hers was the step that roused the zeal
In hearts of gallants:
Folk high and lowly both to please,
To make bright *mots* and repartees,
To bake, to brew,—she numbered these
Among her talents.

Whene'er she passed in quilted gown
Along the highways of the town,
Small wonder that the swains bowed down
In admiration;
And when a handsome stranger bore
The fair one from her father's door,
Why marvel that the jealous swore
From sheer vexation?

A day more gay was seldom seen
Than her bright wedding-day, I ween;
And she,—she bore herself a queen
In look and motion.
And when, with him she loved, she led
The wedding-dance, more light her tread
Than any barque that ever sped
O'er wave of ocean.

The brodered bodice that she wore
While footing it along the floor
Has lain for fifty years and more
In some dark chest hid;
And he whose arm around it stole,
Sought while yet young the starry goal,
A grief which she has, patient soul,
Long in her breast hid.

Her eyes are dim, her voice is faint,
And yet she never makes complaint;
One more serene and like a saint
I have to yet see
Than she who in the corner sits
And dozes, while she knits and knits
Her little nephew's socks and mitts,—
My great-aunt Betsy.

Clinton Scollard.

NOTES AT AN AUCTION.

1. The auctioneer. 2. The confident bidder. 3. Indifferent. 4. Hired. 5. Disappointed.

A Parting Wish.

We bade each other a long adieu,
With looks and tones regretful.
"Whatever happens," I sadly said,
"We never shall be forgetful."

"Ah, never!" replied my faithful friend,
"Our past is a pleasant story.
And oh, I hope we shall meet again
This side of the crematory!"

M. F. Butts.

On the Ocklawaha.

THOUGH perfumes scent the air,
And skies are soft and blue,
Though shores be fresh and fair,
I long for you, for you.

I sigh for cold gray skies,
And the chill sleet slanting through.
It is fair — but I close my eyes
And I long for you, for you.

Walter Learned.

A Pin.

OH, I know a certain woman who is reckoned with the good,
But she fills me with more terror than a raging lion would.
The little chills run up and down my spine whene'er we meet,
Though she seems a gentle creature and she's very trim and neat.

And she has a thousand virtues and not one acknowledged sin,
But she is the sort of person you could liken to a pin.
And she pricks you, and she sticks you, in a way that can't be said—
When you seek for what has hurt you, why, you cannot find the head.

But she fills you with discomfort and exasperating pain—
If anybody asks you why, you really can't explain.
A pin is such a tiny thing,— of that there is no doubt,—
Yet when it's sticking in your flesh, you're wretched till it's out!

She is wonderfully observing— when she meets a pretty girl
She is always sure to tell her if her "bang" is out of curl.
And she is so sympathetic: to her friend, who's much admired,
She is often heard remarking, "Dear, you look so worn and tired!"

And she is a careful critic; for on yesterday she eyed
The new dress I was airing with a woman's natural pride,
And she said, "Oh, how becoming!" and then softly added, "It
Is really a misfortune that the basque is such a fit."

Then she said, "If you had heard me yestereve, I'm sure, my friend,
You would say I am a champion who knows how to defend."
And she left me with the feeling— most unpleasant, I aver—
That the whole world would despise me if it had not been for her.

Whenever I encounter her, in such a nameless way
She gives me the impression I am at my worst that day,
And the hat that was imported (and that cost me half a sonnet)
With just one glance from her round eyes becomes a Bowery bonnet.

She is always bright and smiling, sharp and shining for a thrust—
Use does not seem to blunt her point, nor does she gather rust—
Oh! I wish some hapless specimen of mankind would begin
To tidy up the world for me, by picking up this pin.

Ella Wheeler Wilcox.

A Slip.

A BROOKLET and a pretty maid o'er mossy stones went tripping,
And then the pretty maiden said, "I'm awful 'fraid of slipping."
The saucy brooklet laughed aloud, as it ran o'er a bowlder,
And whispered, "She'd have surely slipped if *he'd* been here to hold her."

W. A. Ketcham.

In the Old Days.

"The opinion which men entertain of antiquity is a very idle thing, and almost incongruous to the word; for the old age and length of days of the world should in reality be accounted antiquity, and ought to be attributed to our own times, not to the youth of the world which it enjoyed among the ancients: for that age, though with respect to us it be ancient and greater, yet with regard to the world it was new and less."—*Bacon.*

In the old days, when you and I were young,
Before the story was told, and the song was sung,
You spoke, it seems to me now, in another tongue.

In the old days, before we were grown so wise,
When gladness meant the same to us as surprise,
You looked at me with other, with truer eyes.

In the old days, when life was martial and grand,
Before we had learned to reckon and understand,
You clasped my hand with another, a warmer hand.

In the old days? Ah, what is this I have sung?
Were they old days, when grief spoke an unknown tongue?
These are the old days—those, the lost, were the young.

Margaret Vandegrift.

Battledoor.

MERRY-HEARTED maidens four,
Laughing, play at battledoor;
And my heart, the shuttlecock,
To and fro they nimbly knock.

Maggie, Fannie, Hattie, Kate—
How their bright eyes scintillate,
As the poor, bewildered thing
Back and forth they gayly fling!

Ha! 'tis lodged in Fannie's hair;
Scarce a moment nestles there,
When away it bounding flies,
Lighting plump in Hattie's eyes.

Now in Katie's kerchief hides;
Then, abashed and blushing, glides,
(Battledoor is full of slips!)
Bouncing straight to Maggie's lips.

Merry-hearted maidens four,
Playing thus at battledoor,
Cease, oh! cease, my heart to knock,
Poor, bewildered shuttlecock!

MIDSUMMER HOLIDAY NUMBER.

THE CENTURY MAGAZINE.

VOL. XXXIV.

AUGUST, 1887.

No. 4.

THE stillness of the Patriarch's studio had been broken by a loud knock announcing Brushes and the Scribe. The Patriarch had just returned from a sketching-tour in Holland. At the present moment the blue smoke from three corn-cob pipes filled the cozy interior, and drifted up in uneven lines to the skylight.

"Very charming, my dear fellow," said Brushes, critically examining the Patriarch's color-sketch of some Dutch luggers reflected in the canal, with the spires of Dordrecht in the distance; "but why tramp the earth in search of the picturesque when Berkshire, the Long Island Coast, and Jersey are right at your door? Some good art begins at home."

The Patriarch leaned back in his chair, looked sidewise at his Academy picture of San Giorgio, nearly completed, incredulously closed one eye, and blew a cloud of Lone Jack through the window.

Brushes took possession of the greater part of a divan covered with skins, and continued:

"Furthermore, see how you travel. Crowded into a stuffy state-room or packed into a Pull-

man. This done, you think you have reached all the luxury of the century, and yet here within a mile of us, in fact at the foot of this very street, are half a dozen floating comforts, each one of which contains more actual luxury to the square yard than a fleet of Cunarders—I mean an ordinary canal-boat."

Up to this time the Scribe, the proprietor of the third pipe, had kept silent.

"What sort of a canal-boat, Brushes? An excursion-yacht with silk cushions, red and white striped awnings, and a tea-kettle in the stern with a tin whistle?"

"No, your imaginative quill," replied Brushes; "a plain white-painted, three-hatched, and poop-cabined canal-boat with two mules ahead and a rudder behind; a skipper to steer, his wife to help cook, and a deck-hand forward to 'snub'* her in the locks and take a line to the tow-path. See here," he continued, springing from the lounge, seizing a piece of charcoal, and reversing a canvas; "here's your regulation canal-boat," and he sketched in the outline of Noah's ark without the traditional house. "Over this flat deck I

* An expression used by canal-boatmen, meaning to check the impetus of boats on entering a lock.

mean to rig an awning, on movable legs, to accommodate low bridges. Down this forward hatch I throw a broad staircase leading into the hold. When you get down into it you will find an interior about seventy feet long, eighteen feet wide, with a ceiling some nine feet high, beamed and bracketed like a Venetian banquet-hall, and furnished like a gallery with three great skylights for air and light. This is your Grand Salon. Up under the bow, between the bracing timbers of the boat, are your butler's pantry and a place for your Allegretti, with its ice and provender. Next to it, divided by partitions of straw mattings and curtains, are your dressing-rooms.

"Now cover the floor of the boat with mattings overlaid with India rugs; hang the walls with tapestries and studio stuff; place against them some cabinets, and divans serving as beds by night and lounges by day; build amidships and under the larger hatch your dining-table; move in a lot of studio properties, antique chairs, hanging-lamps, old water-jars, pottery, and brass, with some linen, glass, and china; get a good cook and a competent steward, and you have a craft compared to which Cleopatra's barge was an Indian dug-out."

It was evident that neither the Scribe nor the Patriarch saw these possibilities.

"You don't believe it? Come with me, then, in the morning, and pick out a boat. It is exactly the month to make the trip. We

The Patriarch was not convinced, but his curiosity conquered. The three agreed to meet the daily North River tow on its arrival at Coenties Slip, New York city, the next morning, and the sum of all the adventures growing out of that decision will be found in the succeeding pages.

"Too narrow," said Brushes, peering down the half-lifted hatch of a Lake Champlain boat; "what we want is an Erie boat. Our canal is the Raritan. There are no bridges that do not swing, and a twenty-foot laker can slip through any lock without scratching her paint."

Before noon Brushes had traveled over the decks and slid down the hatches of half the boats in the basin. Some were too low; others under charter; one was full of potatoes; another loaded with a miscellaneous cargo of chairs, cheese, bales of straw, and wooden ware; a few were loaded with grain, and only one or two empty.

"Say, Cap," yelled out a red-shirted, straw-hatted skipper from the cabin window of a canal-boat, "Dusenberry's got a boat jes suit you. Regular long-waister, she is. No thwart timbers, hatches more'n ten feet across, and a daisy of a kitchen and cabin. She is hauled out at Hoboken. Dusenberry's been paintin' on her."

"What's her name?"

"The *Seth G. Cowles*."

In ten minutes the party had crossed the ferry, Brushes forging ahead, and the Scribe

WHARF RATS.

want an outing, and New Jersey, with its historic associations, quaint houses, and flat stretches of marsh and water, is Holland all over again, even to the windmills."

"'Tis well," said the Scribe, "and we will wire Scraps to join us at Perth Amboy, and if your floating Oriental coal-bin is unendurable, we will make a tent of the awning, unload the furniture, and camp out at the first lock."

and the Patriarch catching their breath three blocks behind. There was no mistaking the boat. She lay high and dry on the mud-flats, with her name in gold letters freshly painted across her stern. The nautical eye of Brushes took in her points at a glance. He was heard to say, "Twenty foot beam; wide hatches; flush deck; cabin well aft; bow high; and tight as a drum." Dusenberry came up.

paint brush in hand, and confirmed Brushes' favorable opinion. The price was agreed upon, and all arrangements completed to deliver her at the foot of East Thirty first street, at high water, a few days later.

The succeeding two days were spent in the

ing ferries began to take an interest in the proceedings; so did the wharf rats, who fringed the hatches till the last moment.

Brushes sent his 'cello, the Scribe his guitar, while Scraps brought his voice. Before night the *Cowles* had developed from a canal-boat

THE GRAND SALON.

construction of an awning with a patent up-and-down folding movement; making a staircase with protecting railings; fitting up a butler's pantry, with racks for dishes, shelves for crockery, and the like.

Each man had his duties. All carpenter work and fittings were, of course, Brushes'. The Patriarch had charge of the decoration, tapestry, furniture, studio properties, etc.; the Scribe, the crockery, glass, kitchen-ware, and domestic comforts; while Scraps, who had rushed in hot haste from Perth Amboy, was a committee of one for provisions and steward's supplies in general. Under the Scribe's care came also the selection of a steward. At the end of the second day he produced a light-colored mulatto, all collar and shoes, with the bow of a folding jack-knife and the manners of a diplomat. His name was Moses.

The eventful day and the *Cowles* came in at about the same hour; for, with the economical habits of her distinguished commander, Captain Dusenberry, she swung in at daylight, so as to gain half a day on her charter; and before the Patriarch had broken the shell of his egg at breakfast, word came that the *Cowles* was alongside of the string-piece, and ready for cargo.

Later the same day the furniture and fittings were on board, and crowds from the neighbor-

grub to a butterfly Venetian barge. Even Captain Dusenberry, who had uneasily watched the transformation from his seat beside the tiller, was heard to say to his wife: "Marthy, old *Seth* looks like a circus." To him, as to the boatmen, lockmen, drivers, and others of their sort, who clambered on board, at invitation or without it, many times a day during the trip, the floating studio was a veritable wonder; an accumulation of much that was rich, strange, and beautiful to them, and of many rare objects of art at which they could only express astonishment — not always complimentary. About a quarter of the hold, under the forward deck, had been curtained off for the use of the steward, and for the storage of his supplies; and a corner of this space near the stairs, which led down the forward hatch, was reserved as a dressing-room. An open space under the stern hatch, separated from the salon by heavy old draperies of satin and embroidered silk, through which the light from the after-hatch shed a soft illumination, was reserved for the storage of personal baggage, extra cots for expected friends, elaborate mosquito nettings, sketching traps, and art materials enough to last the whole summer. Thus the entire central portion of the hold, a space of sixty or seventy feet, became the salon, and

MAKING UP THE TOW.

upon its adornment and convenient arrangement all the assembled taste and experience were centered.

The walls from floor to ceiling were covered with old tapestries, and upon them were hung rare etchings, delf plaques, brass sconces, and choice pictures. There was still plenty of room to tack up sketches as fast as made. At intervals, along the sides, Venetian church-lamps, a censer or two, and some richly hued marine lanterns were suspended from the dark, heavy beams which upheld the deck and served as a magnificent ribbed ceiling, low and agreeable in tone, and beautiful in its curved lines. At the farther end of the salon was built a permanent table of generous dimensions, placed longitudinally, which served as a dining-table, and which became, between meals and in the evening, a common center across which were exchanged the adventures of the day and the plans for the morrow. About it were grouped a number of carved and ornamented antique arm-chairs of large pattern, each one of which was to its neighbor a stranger from a strange land. Holland, Spain, Italy, Mexico, England, and Plymouth Rock jogged elbows, and trod under their feet prayer-rugs from Smyrna, Bokhara, and Hindostan. The coal-stained floor, and the battered keelson, upon which had been

dumped many a ton of anthracite, carefully scrubbed and cleansed, were covered throughout the length of the boat with fresh, clean China matting. The cots along the side were perfectly disguised as divans, and brought into "tone" by a judicious use of Turkish and India rugs, camel's-hair blankets, etc. A carved oaken chest, of the thirteenth century, served as a sideboard, and from the opposite side an English high chest-of-drawers of two hundred years ago flaunted its brass handles. A Japanese bronze vase, as high as the back of an old-fashioned chair, richly ornamented in relief with tangled gods and sacred snakes, degraded from the splendor for which it was deservedly intended, now served as a depository for smoking materials. Nearby an old-fashioned writing-desk, always open, presented a continual opportunity for communication with the unfortunates in the outside world,—above it a shelf or two of well-used favorites (chief among them the Patriarch's Dante and the Bhâgavata Gîta), with the current magazines, and a few light publications of the year. An easel or two, colored silk draperies at the main hatch to diffuse the light, bracketed and swinging lamps at convenient intervals, and brass plaques to catch wandering rays, completed the interior.

"Let go your bow line!" sang out the captain of the tug *Young America*, getting up the boats for the night's tow. The crew sprang literally as one man, reinforced by the Scribe, who had sailed a yacht to Mt. Desert and left his position. However, despite the Scribe's assistance, the *Charles* swung clear, and floated out into the East River to join a group of empty coal-boats forming a part of the great tow-boat for Perth Amboy and the entrance of the Raritan Canal at New Brunswick. It was near the close of an August day. A gentle breeze fluttered the apron around the top of the awning and scattered over the deck the loose leaves of an unguarded portfolio.

The *Young America*, with her miscellaneous assortment of canal-boats, dodged here and there across the river, now stopping at Newtown Creek, and then at several wharves on the Brooklyn side, and so on under the bridge to the Erie Basin. Each addition to the tow brought its complement of wharf rats, evidently attracted by the unusual appearance of the *Charles*. They boarded the craft from all sides, hung their legs over the main hatch, and made themselves entirely at home with everything within reach.

"Hey, Jimmy," said one of a group lying flat over the rim of the hatch with their legs spread out like the ribs of a Japanese fan, "ain't them daisy chromos? Say, mister, wot's

object lesson, he explained that it was a can in which the girls in Holland carried milk,—can at each end of a shoulder rest,—sometimes walking a mile or two to a market.

"Huh, full o' beer it wouldn't get half that far," was what he got for his pains.

Another produced a wet base-ball and begged Scraps to catch his curves. Another scaled a post and ran the length of the awning, skipping every other brace, and at the end falling into the arms of Dusenberry, who dropped him over the high stern and nearly into the lap of an old woman who was peeling potatoes for the evening meal on the deck of a lower canal-boat.

The main tow for Raritan is made up at Communipaw Flats. Here the harbor tugs bring the boats from their various docks. The loaded boats are placed in the center, and the light ones outside. It is the business of the tow-master to see that all the expected boats are accounted for, in proper places, and that the whole tow is well made up. He has quarters on the wharf-boat, an old craft with a house on deck, anchored on the flats, and is a power in his way. It was long after dark when the main tow shunted her charge, including the *Cowles*, alongside the wharf-boat, and then, with a parting salute, melted into the gloom. The night was intensely dark. Against the overcast sky the lights on the Brooklyn

the brass jug?" The Patriarch had with infinite pains brought the battered and patched article from Dordrecht, and on the present occasion it stood on the sideboard in the salon, filled with flowers. Seizing the chance of an

Bridge sparkled like a huge necklace of diamonds, and the ferry-boats flew about like fireflies. At the wharf-boat were one or two dim lanterns, and near the bow of each canal-boat was a lantern of uncertain hue, but in-

"THEM FELLERS NEVER DOES NO WORK."

tended to be white. A short distance up stream an enormous double-decked tug lay in wait like a huge monster, its two white lights at the mast-heads describing dizzy curves as she rolled about. Now and then her open furnace doors illuminated the tow from end to end, investing the figures of the men as they moved about with the appearance of unearthly and intangible beings. When fairly off, the life on the boats assumed a new phase. The majority were empty coal-boats, — "Chunkers" from Mauch Chunk, or "Skukers" from "Schuylkill Haven," — and each one carried a crew of two; among the thirty boats in the tow fully one-half had on board the wives and children of the captains. Suddenly, all over the tow fires were lighted in the little coal stoves on deck, and the evening meal, put off until under way, was in preparation. Odors were wafted to the *Cowles* that bespoke a feast somewhere to windward. The awning, aglow with the light from the hatches, became a shining mark, attracting all the boys and men of the tow. The men said little, but the boys made up for any inattention of this kind.

"Say, Billy," said one who until then had been silent, "them fellers never does no work."

At last the deck was deserted, the hatches were pulled over so as to keep out the damp and yet admit a draft, and in a few moments all was dark and quiet.

"COME, boys, tumble out and come up on deck and see Holland." It was Scraps in his pajamas. The tow was approaching Perth Amboy, where Moses announced coffee on deck. The Raritan finds its sinuous way through broad green salt meadows that stretch off like soft carpets until they meet the clay beds and tangled woods of the Jersey shore. It was indeed Holland; the same flat landscape and long stretches of green marsh. One constantly expected a windmill to appear on the sedge, or the spires and crooked tiled roofs of a Dutch village.

In the morning light the tow was a busy and interesting scene. The boats at the head were arranged six abreast, the strongest

among the loaded ones being selected to take the strain of the cables from the tug-boat. The rest fell in behind, the bow of each one being brought snug under the stern of the boat ahead and securely made fast. To prevent the tow from spreading, cables were stretched from the bow of each boat to the stern of its immediate neighbors, and so the whole mass was held fast, but with sufficient play to admit of easy motion when swung by the current or twisted by the tug. Here was a community which spent the summer months traveling. Germans, Hungarians, Canadian French, Pennsylvania Dutch, and Maine Yankees made up its population. At an early hour in the morning the families were eating their ham and eggs and sipping boiled coffee, seated with their children on the deck houses or the water barrels, or perhaps on the

DUSENBERRY'S KITCHEN.

slanting hatches through which the coal is dumped into the hold. On one boat the woman was hanging out the wash, on another the men were mending harness and splicing the tow ropes. The latter boat evidently came

each hull can be loaded at the same time at different wharves.

Scraps had found at the head of the tow a boat of unusual interest. The cabin and the tiller were protected from the sun by a red-

LOOKING THROUGH.

from some far-off point where the teams were not provided by the canal company, for it carried two big mules of its own in a huge box amidships. Boats belonging to the coal company were all low, long, and narrow, and often without any cabins or accommodations for the crew of two. On their bows were painted the numbers by which their movements were traced. The "Chunkers" were frequently of the "lemon-squeezer" pattern. This craft is best understood by imagining two square-sterned boats brought together stern to stern and fastened so by bolts and chains. In narrow canals they are turned in sections, and

and-white striped awning with a scalloped edge, stretched across portable posts. The diminutive windows were curtained with embroidered muslin. On the cabin room were sofa cushions, a rocking-chair, and a small work-table, and in the canvas hammock slung between the posts was a girl. Her father, a grizzled old canal dog, had swabbed his decks while the fire was coming up, and was now frying the steak and potatoes. Later in the day they visited the *Cowles*. The girl was about eighteen, dressed in clean calico. Her sun-bonnet, pushed back, hung behind her neck. Her abundant black hair was gathered

straight back into a knot. She had a well-rounded and gracefully robust figure, and arms like those of an antique statue. Altogether she was totally unlike any preconceived notions of what would be found on a canal

the tow fairly within the bight than the tow-master begins breaking it up. The boats are in turn shunted into the lock by a steam windlass. Once in the lock the boat finds its team of four mules, tandem, waiting on the tow-

AT TEN MILE LOCK.

boat. Her father owned his boat and the mules, which had been left at New Brunswick on the down trip. In the summer they carried freight, and in the winter lived on a little farm in the mountains. The mother was dead, and this girl was her father's only deck-hand. She could "snub" a boat like a man, or steer one into a lock with a touch that would not have cracked an egg.

The tows always take advantage of the tide, and on this particular day a breeze up the river added its modicum of power. No stop was made until New Brunswick was reached. As soon as the tow was made fast, the Patriarch and the Scribe went ashore in search of a tow-rope, which the over-cautious Captain Dusenberry omitted to include in his outfit, to engage a team, and to pay the towage up the canal. This town is the headquarters of the canal traffic. Here are the company's offices, and just beyond is the first lock. The mule stables where the teams were kept, the boarding-houses for the men, and the grocery, hardware, and fancy goods stores were together along the water-front. The canal follows the left bank of the river. No sooner is

path in charge of a driver. If there are not enough teams to go around, there is nothing to do but to wait until one comes down with a boat bound out, and gets its feed and a half-hour's rest before starting back. It was for the purpose of making sure of a team, and a lively one, that the Patriarch and the Scribe visited the company's offices. The mission was accomplished, the authorities were entertained on board the *Cowles*, and about noon Dusenberry, assuming command, gave word to the tow-boy, and started the four white mules. A day's work for a team is fourteen miles, and therefore Ten Mile Lock, $2\frac{1}{2}$ miles above Bound Brook station, was to be the end of the day's journey. Without incident and without danger, save the brief period when the Scribe essayed to steer, the boat slid along at the average rate of about three miles an hour. Every turn in the canal developed something worth sketching. Constantly the mules were halted, and the *Cowles* made fast to the heel path out of the way of passing boats. From the high deck the canal seemed to be running up-hill, and the river much farther beneath than it actually was. The

motion of the boat was like that of an Indian canoe well paddled. It is an ideal way to travel. Here is a highway which the traveling world has abandoned. No dust, no noise, no hurry, no train-boy; stopping when you like; plenty of pure air; and for fresh vegetables you have only to run out a plank, and go ashore to the nearest farm-house.

"What time will you lunch, gentlemen?" said Moses as he passed the milk punch. This was a matter to be considered once for all, for the daily routine must be laid out.

"Now," was the reply; "and after this coffee on deck at eight, breakfast at twelve, something quiet at four, and dinner at eight. To-day give us a broiled chicken and a lettuce salad."

"Yesser, but there ain't no lettuce."

"Plenty of it in sight," said the Patriarch, pointing with his cigarette-holder to a Jersey farm.

"Whoa, there!" said Scraps. The leader of the team pricked up its ears and stopped, the boat shot ahead until her headway was spent, and then hugged the bank.

Loaded with instructions to buy anything that was edible, Moses took his way across a field and through an orchard, swinging a basket in either hand. In half an hour he returned with lettuce, cucumbers, tomatoes, milk, egg-plant, and three spring chickens. Once more the mules took up the slack, and after an hour of patient plodding, the bridge across the Raritan at Bound Brook hove in sight. Passing

the *Coaches* found convenient spiles sunk in the heel path; and there, within two hundred yards of fresh milk and new butter, the second night was spent.

In the morning the regular routine began. First a plunge overboard into the cool water, then coffee and rolls. Then sketching ashore or on board, or perhaps a brisk turn along the tow path. After breakfast a siesta, or a nap on deck under the awnings. In the evening after dinner a chat, a smoke, and a long night's rest, with the pure country air to expand the lungs and foster the appetite.

With the next day's run, to Kingston, a more picturesque country was entered. Afar off peach orchards were descried. At the railroad stations and at the locks baskets were piled high, en route to the New York markets. The canal from Kingston to Trenton is lined with picturesque spots. The tow path at Princeton runs for miles along the bottom of a steep bank from the top of which beautiful old trees cast their shadows half way to the opposite bank. It is like a cultivated park. The drivers and their mules linger in the grateful shade, reluctant to hasten on to the barren open fields and dusty roads which mark the approach to Trenton.

THE canal forms a Y at Trenton. The right branch is the "Feeder" carrying the water from the Delaware River to supply the canal.

Brushes had a brother-in-law half a mile

through the lock and around three gentle curves they came in sight of the whitewashed buildings and willows of Ten Mile Lock, the first station on the canal.

Just beyond the lock at the end of the crib

beyond Trenton who had been watching for the *Coaches* for a week. This relative had a garden filled with pease and late asparagus, and a cook who could bake a ham with such exceeding toothsome-ness that Brushes

OPENING THE GATES.

WATCHING THE "CIRCUS BOAT" AT KINGSTON.

insisted upon altering the course of the *Cowles* at once. In fact, the ham was baked and waiting.

"Won't take us half an hour," he urged; "canal skirts his melon bed." But Dusenberry objected. He didn't know nothin' about this "Feeder"—guessed it didn't have no basins to turn around in. He wouldn't be responsible for the boat anyhow. If Mr. Brushes wanted the tiller, it was his'n. In this dilemma Brushes interviewed a native, who declared that two miles up, at a quarry, there was a basin where the *Cowles* could "go round a-humpin'." This being settled, the Patriarch stepped ashore and arranged for an extra team of mules and a tow-boy. The *Cowles* swung through the narrow bridge, and the voyage of discovery and adventure began.

"How far is this ham?"

"One mile from the railroad bridge," replied Brushes. Just then Scraps came tumbling up the stairway armed with a sheet of Whatman paper and a palette. He took in the picturesque water-front at a glance, flattened himself out on the deck, and began washing-in some old rookeries on the opposite bank. A group surrounded him, and the subject of the *détour* was soon forgotten. What difference did it make? One canal was as good

as another! Let her go through to the end, and, if there was no turning room, hitch the mules to the rudder post and come home backwards!

Be it said to the credit of Dusenberry that through the vicissitudes which followed this decision he stuck to his tiller manfully,—that when the forward flag-pole carried away the fire-alarm telegraph wire and started half the bells in Trenton ringing two minutes thereafter, he still preserved an Egyptian gravity of countenance. Every foot of the canal was a *aqua incognita* to him. The gates were handled differently, the snubbing-posts were set farther apart, and the locks were much narrower and shorter. But after the first bridge was passed he prepared himself for the worst, although his mind was constantly filled with visions of the boat wedged between a swinging draw and the left bank, with her upper deck awash while her keel quietly rested in the Jersey mud. When the telegraph wire snapped he merely dodged its whirling end as it whipped past his head, and said between his teeth to Martha, "This foolishness ain't goin' to last. They'll butt down a drawbridge next. Marthy, any set of fellers who will git a man into a hole like this for a ham ought to be drowned"; and then, in a lower voice, "and I guess they will."

A STERN VIEW.

Scraps worked away like mad, spattering his color around and smearing a whole tube of Chinese white on the clean deck in his hurry to catch a sky tint before the curve of the canal ruined his perspective. The Patriarch smoked away contentedly from amid the cushions under the awning, and enjoyed the splendor of the setting sun and the ragged line of the potteries with their conical chimneys silhouetted against the brilliant sky. The Scribe, in a moment of enthusiasm, was booking the log. The only uneasy man aboard was Brushes. He paced the deck continually, took soundings with his eye, and when the big laker barely scraped through a narrow draw-bridge with half an inch to spare, he followed with quickened step the protecting fender down her whole length until the boat swung clear and the danger was passed. Finally he mounted the bow and swept the long canal with his glass. Low, rambling, old-fashioned houses with red roofs; modern high-peaked gables; moss-covered, slanting, shingled tops; houses with trees, and houses bare as Sahara — houses of all kinds and periods. Melon patches in an advanced state of cultivation, and gardens overrun with pease and belated asparagus galore. All these and more rose to view as the perspective became distinct, passed in review, and were lost in the afternoon

glow. The sturdy team, which had already done twenty-two miles, bent mulefully to their work and kept the tow-line taut as a fiddle-string, and yet no sign of the brother-in-law's. Then it was that Moses, ever patient, with providing watchfulness peered up the hatch, sidled up to the bow watch, and said, "Did I understand you to say they was to be a baked ham for dinner?" Brushes fixed his eye on him for a moment, restrained an imprecation, and watched a red roof with high chimneys evolve itself from amid a grove of chestnuts. In another moment an uncertain pathway wandered out from a row of white palings, turned down to the water's edge, and sprawled itself over a small wooden dock, on the extreme end of which sat a solitary darky fishing. "Is dat you, Mass' Brushes? The boss been waitin' for you a week."

"Yes; who are you?"

"Jim."

"Where's your master?"

"Tuck sick and gone Saratogy wiff de chillen."

"Who's at home?"

"Ain't nobody at home, sir! House locked up, and de key ober to de drug-store."

Brushes shut his glass, walked to the hatch, and said in a voice like a commodore:

"Moses!"

"Yesser," came rumbling up the reply, followed instantly by that daisy.

"You needn't wait dinner for that ham."

The tow-line slackened and wavered. Dusenberry went forward, passed a snubbing-rope to the tow-boy, who slipped the noose over a stump. Dusenberry gradually paid out the rope as it tightened around a cleat. The wet hawser held fast, and the *Cowles* rested.

The red-headed tow-boy clambered up and over the bow and approached the group, hat in hand.

"Do any of you gents know where you are gon'?"

"Certainly, going to turn around."

"Where?"

The silence that followed was painful. Certainly not here in a canal half her length? Where then? Perhaps higher up. Perhaps at the next bridge, but nobody had any positive data. The tow-boy had never seen but one laker go through the "Feeder," and she stuck in the mud at Scudder's Falls and staid all winter. The bridge-tender, called in for consultation, thought the *Cowles* "a little mite" longer than that laker. He remembered they had to lock her down into the Delaware, in the spring, to get shunt on her. Dusenberry had no advice. He didn't know nawthin' about this old mud-drain anyhow, and didn't want to. He could stay all winter,—under pay. Made no difference to him.

It was a peculiarity of the Patriarch's that he sometimes rose to the occasion. Indeed, there was a suspicion among his brother artists that his early youth had not been altogether spent in the recesses of his studio. Rumor had it that before art claimed him for her own he had so far dallied with commerce and trade as to have taken charge of a merchantman. There was one man who had even asseverated boldly that he had seen him in pea-jacket and tarpaulin and other habiliments none the less honorable. His title of "Patriarch" was not conferred upon him by reason of his extreme age or whitened locks, for only with great difficulty could any tell-tale hairs be found to mark the trail of fifty summers, but rather on account of his varied experiences and early occupations.

Calling the Scribe he disap-

peared among a group of natives on the bank, interviewed them closely, clambered back, and announced his intention of trying the basin at the quarry and then at Scudder's Falls. In an hour more both points had been reached, measured, and passed. The *Cowles* was too long by a quarter.

The situation now became critical. Here they were in a ninety-five-foot boat afloat in a seventy-five-foot canal, and no basin nearer than the Delaware. To go backwards was an utter impossibility, for it was hardly within power to keep the *Cowles* off the bank or to pass the bridges even with the full use of her rudder. To go forward was ruinous. Besides, the team was tired out. "Gentlemen," said the Patriarch, "there is but one chance left,—the timber basin at Titusville." Again the steady, patient little team bent to their traces. The cry of the tow-boy rang out, and Dusenberry's horn, warning the passing "Chunker," was heard along the canal. Past many beautiful farms, under the high trestle-bridge on the Bound Brook route, down the long straight line of the canal, and overlooking the Delaware Valley, with the purple

"SHE COULD SNUB A BOAT LIKE A MAN."

ENTERING THE LOCK AT NIGHT.

mountains beyond, and up to the white swinging-bridge at Titusville, glided the *Cowles*. The bridge opened, and she slid into the still waters of the basin. The twilight had now settled down. On either side stood the good people of the little town looking with astonishment upon the stately laker with her white awnings, under which hung the Chinese lanterns just lighted. The Patriarch's voice woke the crowd to consciousness. "Can we turn our boat here?"

"How long be ye?" came a voice from the bank.

"Ninety-five feet over all."

For a moment there was a dead silence. Then came bounding over the water:

"Yes, if you fellows can tote her."

But the Patriarch did not lose his grip. His eye ran over the curved line of the basin, caught sight of a mooring-spile near the bank, and in a moment the helm was put hard down, and the *Cowles* gently rubbed her nose against its oozy bark. Swinging himself clear, he alighted in the tall grass of the water's edge and made fast a line to a cross tie on the railroad track which skirts the canal. Then all hands were ordered forward, and the boat moved quietly along until her bow sank into the soft edge. "Now take that line aft lively," sung out the Patriarch, "and make it fast to the stern cleat, and pay out to the tow-boy, and don't start the mules till I get aboard." "Ay, ay, sir!" came a voice from the deck. At this juncture a new difficulty presented itself. A line of coal-loaded

"Chunkers" was turning the low point above and making straight for the *Cowles*, which now lay almost at right angles across the canal.

"Hold on with that team—slack up, slack up!" thundered the Patriarch.

"What the—are you doing with that 'circus boat,' blocking up this gangway?" came a return voice. But the Patriarch had no time for explanations. In an instant he was on the *Cowles's* bow, along her deck, and over her stern. She was aground, her rudder blade hard back, and the rudder post lifted. Between her and the bank was a skirting of soft marsh grass. If this grass had an equally soft mud bottom there was just one chance in a dozen that a long pull and a strong pull might lift her stern clear and slide her into deep water. He decided to take it. Amid the choice imprecations of the "Chunker" fleet the Patriarch calmly unhooked their mules, doubled up his own team, impressed into service a second tow-boy, and gave the order, "Now, all together!"

Two whips cracked simultaneously. A yell went up from the row of open mouths on the *Cowles*; the tow-line whizzed through the water; the mules bent forward almost to their knees; the boat careened, staggered, and shivered; and the line straightened out like a bar of iron. Suddenly there came a cry from the tow-path.

When the dust cleared away a pile of mules was heaped up in a sand bank, and two tow-boys were tangled in a tow-line.

The rope had parted!

In the momentary silence that followed some one broke out in a loud laugh. It was Dusenberry!

F. Hopkinson Smith.

"JESSIE."

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Leeks and Mrs. Aleshine," etc.

XXVII.

WHEN Arthur Thorne jumped up so suddenly on hearing the surprising announcement that Gay Armatt was not engaged to be married to any one,

the noise made by his falling chair brought Mrs. People hurrying to the porch.

"Why, how do you do, Mr. Thorne?" she exclaimed. "I hadn't the least notion in the world that you was here, and if you've been trying to tilt back in that chair I wonder you didn't break your neck! The hind legs is too straight up and down. I'm very glad to see you here again, though Mr. Stratford never told me a word of your comin', and I'll have your room ready for you in ten minutes."

To these remarks Mr. Thorne made no reply, but stood looking at Stratford. He was a man notable for his courteous manners to every one, but his mind was so completely occupied with what he had just heard that he scarcely noticed that Mrs. People was talking to him.

After a very searching gaze directed upon Mr. Thorne, that good woman stepped inside the front door, and beckoned to Stratford. The latter excused himself to his visitor, who was still standing in blank staring astonishment, and went into the house. He was very glad to do so, for conversation with Thorne in his present state of mind and Mrs. People near by, was not to be desired.

Mrs. People conducted Stratford into an inner room, and closed the door. "If I was you," she said quickly, "I'd take him upstairs jus' as soon as I've put on the clean sheets and pillow-cases, and I'd have him in bed before his chill comes on. Of course he brought it with him, for there's nothin' of the kind here, but this mountain air often does bring 'em out dreadful sudden, when the system is full of malariousness. It won't do to give him any quinine till he's got through with his fever, and I'm no hand to be recommendin' mustard plasters and hot foot soaks before there's any real reason for usin' 'em; but what I'll

make for him, and bring it up to his room almost as soon as you've got him tucked in comfortable, is a big bowl of hot quassia tea. Mr. People, when he was livin', used to say that there was nothin' that suited more of the different chronic things that he was afflicted with than quassia tea. It's bein' such a good honest bitter is one of its strong p'int, and Mr. People has told me often, when he took it for some of his more triflin' complaints, that he forgot he had anythin' the matter with him but a taste in his mouth. So I'll put the quassia on to draw, and then I'll take Maria right up to his room, and we'll get it ready."

Stratford did not interrupt Mrs. People in these remarks, for they amused him, and he was very willing, moreover, not only to give his friend time to tranquilize his mind somewhat but to get an opportunity to arrange his own ideas. But he now told Mrs. People that Mr. Thorne needed no medicine whatever, but was merely a little disturbed in his mind by something that had occurred.

"Disturbed! I should think!" said the kind-hearted woman. "And if he's lost all his money I hope you'll tell him, Mr. Stratford, that as long as he's a friend of yours there's always a room for him here, and the board may run on for a year, if he likes."

Stratford thanked her, and went out to meet his friend. "Let us go under that big tree," he said, "where we can talk more at our ease."

When they reached the big tree Stratford took a seat, motioning his friend to another; but Thorne remained standing. "Do you mean to tell me," said he, "that Miss Armatt is perfectly free, and disengaged?"

"Yes," replied Stratford, "that is what I said."

"Well, then," asked Thorne, "what reason is there why I should not pay my addresses to her?"

"There are two very strong reasons," said Stratford. "One is that it would be heartless in any one to address a girl whose sensitive nature has just received a very severe shock in the breaking off of an engagement; and in the second place it would be very bad policy both as regards Miss Armatt and yourself."

* Copyright, 1886, by Frank R. Stockton. All rights reserved.

But from what I know it is not at all certain that Crisman has lost all his chances. Were he to repent and return, and there is no reason why he should not do this if he is not an absolute ass, I should be very much afraid of the result. With a girl of Miss Armatt's principles it would be much easier to renew a former engagement than to make a fresh one. Any attempt now to enlist her affections would throw her mind into such disturbance that, were that man to return, he would find her troubled mental condition greatly to his advantage."

Thorne snapped his fingers impatiently. "For these reasons," he said, "I suppose you are now keeping away from her."

"The reasons have nothing to do with me," said Stratford. "As you very well know, I have no intention of addressing her, and my object is, as it has been, to bring her mind into such a condition that the element of regard for Crisman must necessarily be eliminated from it."

Thorne stood for some moments steadily gazing at his friend. Then he said: "Stratford, that may all be very well, but it seems to me that I am the one who should undertake the task of encouraging and helping this young girl in the way you speak of. I have an object in it, which you say you have not. I have heard you speak of carrying her over the gap which the success of your plans might create. Very well then, let me carry her over. I shall not drop her on the other side, as you say you intend to do."

"My dear boy," said Stratford, with a smile, "you couldn't do it. You don't know her, and she does not know you. In many respects you are strangers to each other, and it will be utterly impossible for her to have that confidence in you, and I may say that regard for you, which is absolutely necessary in this case. It would be impertinent, and utterly unjustifiable, for me or any one else to attempt to arrange Miss Armatt's future for her. I have simply endeavored to avert from her an evil which she did not understand, and I hope I have succeeded. With anything further than that I have nothing to do; but I will say, as I have said before, that it would delight me very much to see her married to such a man as you. And, by the way, I wish you would sit down."

Mr. Thorne did not move. "Stratford," said he, "you are very difficult to understand, and I don't pretend to be able to do it; but you have said two things with which I agree. One is that it would be wrong to address the lady openly at this time; and the other is that my comparatively slight acquaintance with her places me under a very great disad-

vantage. This I shall endeavor as soon as possible to remove. I shall try to know her, and let her know me. I came into these parts solely to see her; I shall remain for the purpose of becoming thoroughly acquainted with her; that is all; and I shall do no more until the proper time comes. It is a good first step, and I am glad you suggested it to me."

Stratford did not immediately reply, but presently he said: "Then I am to have you here with me?"

"No," said Thorne, "that would not be well. You are very kind, and so is that good woman. But I shall not be satisfied to stay here. I shall wish to feel perfectly independent. I shall go to the hotel in the village. There is one there, I believe?"

"There is no hotel," said Stratford; "there is nothing but a tavern, and I am sure it won't suit you at all. It will be much better for you to stay here."

"You are very good indeed," said Thorne, "but I prefer the tavern. I left some baggage at the station, and I will have it sent there. Good-bye."

Stratford rose, and took his extended hand. "I suppose I shall see you again," said he.

"Oh, yes," said Mr. Thorne. "No doubt we shall meet often." And he strode away.

"He don't believe in me," thought Stratford. "And he is wonderfully changed."

The next day Mr. Thorne made a formal call at Mrs. Justin's house. He saw both the ladies, and although there was no trace of the fact in their manner, neither of them was glad to see him. Gay thought that he would prove an interruption to the course of reading that she and Mr. Stratford were carrying on together; and Mrs. Justin could not but imagine, remembering Mr. Thorne's letter to her, that in some way he had heard of the broken engagement, and, considering the field open, had come to pay his addresses to Gay. Of this she did not at all approve, for, after what had happened, there was only one man she favored as a husband for her young friend. She would not have Gay tossed about like a shuttlecock from this man to that.

Mrs. Justin was not long left to conjecture upon this subject. Mr. Thorne took an early opportunity of speaking to her privately. He informed her that his feelings and aspirations in regard to Miss Armatt remained the same as when he had previously communicated with her by letter; and that having recently heard that the young lady's affections were now disengaged, he desired, at the proper time and season, to endeavor to win those affections; but that he was very well aware that any such attempt would be useless and reprehensible at present. All he now wished was to obtain Mrs.

Justin's consent, as the young lady's friend and guardian, to visit her and make her as thoroughly acquainted with him as possible. Mrs. Justin might feel assured that more than this he would not do during his present stay in the vicinity.

To all this Mrs. Justin could make no outward objection, although she did not like it at all. She knew Mr. Thorne to be a perfectly honorable man, and therefore felt justified in inviting him to visit her frequently during his stay; but she gave him no encouragement whatever, stating that she did not feel that she had any right to say or do anything which could be construed to affect in any way Miss Armatt's prospects of the kind alluded to.

"I wished to make my object and intentions plain to you, madam," said Thorne, "without leaving anything to conjecture; and if, after hearing me, you permit me to visit your house, it is all I ask."

"He is too horribly correct," thought Mrs. Justin, when Thorne had gone, "and in this case nothing could be worse than that, for it gives me no opportunity to oppose him."

When Mrs. Justin next saw Stratford she expressed her impatience with this visit of his friend Thorne. "He is a thoroughly good fellow," she said, "but I do not want him to interfere with you."

"Mrs. Justin," said Stratford, his brows contracting as he spoke, "am I never to expect to be believed by you regarding my intentions towards Gay Armatt?"

"I do not wish to believe what you have said to me about them," she answered, "and I earnestly hope that you will say nothing more of the kind. You ought to marry Gay Armatt for your own sake, for everybody's sake, but above all for her sake. It would be cruel, positively cruel, for you to drop her now."

"I do not wish to say anything," said Stratford, "which might give rise to unpleasant feelings between us, but I will merely re-assert, entirely for my own satisfaction, that I do not intend to marry Gay Armatt."

"I should be grieved indeed," said Mrs. Justin, "if any unpleasant feelings should arise between us, but I will say, entirely for my own satisfaction, that you can't help it."

And with that she left him.

XXVIII.

WHEN the alterations at Vatoldi's had reached that stage at which John People could personally carry out the manifold directions and plans of Mr. Stull, the work went on rapidly, and it was not long before the famous restaurant, greatly enlarged, and very much improved, opened its doors again to the pub-

lic. The boycotting campaign having come to an end, it was very easy to secure a corps of trained waiters, nearly all the old ones being eager to return to their former positions, and being no longer under the influence of the contumacious Bencher they were perfectly willing to renounce all aspirations in the direction of coat-tails.

But against any future trouble of this kind Mr. Stull had fully provided. The employees were all very well paid, but each man signed a printed contract by which he agreed that a certain percentage of his wages should be held back and forfeited in case of dismissal for misconduct, the most important breach of rule being any attempt to redress grievances by other means than those stated in the contract. Mr. Stull had given a great deal of time and thought to the construction of an agreement, which, while it offered good men inducements to enter his service, would make it a losing business for them if they attempted to interfere with his methods of regulating the establishment. All these arrangements, with many others tending to place Vatoldi's on a higher pedestal than it had yet stood upon, were carefully carried into effect by John People, whose conferences with his superior not only took place every afternoon, but frequently occupied a large portion of the evening. An increase of custom quickly greeted the re-opening of the restaurant, and Vatoldi's soon became a more crowded and fashionable resort than it had ever been before.

When all this had been accomplished, Mr. Stull thought himself entitled to a holiday, and repaired to his farm near Cherry Bridge, where he could not only take some country air but look into the business with which Mr. Turby had been intrusted. It might seem a little odd to those who were not well acquainted with Miss Matilda Stull that she should have chosen the time of her father's coming for a visit of herself and her mother to the city; but Miss Matilda never allowed the coming or going of any one to interfere with her plans; and, although she had not formed this plan until she had heard of her father's intention, she declared it to be absolutely necessary that she should go to town to confer with mantua-makers, in preparation for the autumnal season. As she could not go alone, her mother, of course, must accompany her.

The absence of his wife and daughter at the time of his arrival at his farm did not at all disturb the mind of Mr. Stull, who, having come to the country for a holiday, was not averse to a few days' freedom from interruption to thought and action. To be sure, his two younger daughters remained, but these

were little girls who had learned how pleasant it was not to interfere with their father's occupations.

Mrs. Stull had now been made acquainted with her daughter's engagement, and it was, therefore, in the handsome rooms of the Stull city mansion that Mr. Crisman paid his frequent visits to his lady-love during her stay in town.

John People, once more behind his cashier's desk, and behind, indeed, nearly everything else in the establishment, deepened the lines of pensive resignation on his brow. The gentle roll in his gait became more than ever indicative of a determination to go ahead and do his duty, no matter how much care and trouble weighed upon him. All his hopes in the direction of Miss Stull had entirely departed. When Gay Armatt had told him that it was positively useless for him to speak a word of love to Miss Stull, he had gone away believing her absolutely and entirely. Of a truthful nature himself, he could appreciate truth when it was told to him by such a girl as Gay, and told as she told it. He had come to town fully convinced that Matilda Stull could be to him no more than an occasional customer in the restaurant over which he presided.

He took from an inner recess of his pocket-book a two-dollar note, in the corner of which were some initials and a date; and placing this in the money drawer, he repaid himself with two dollars in silver. It gave him a sad pleasure a few minutes afterwards to give this note, with other change, to a lady who was paying her bill. Thrown into the vortex of metropolitan circulation there was no reason to suppose he would ever see it again. Not only did John thus snap asunder the only actual link between him and Miss Stull, but, like the practical man that he was, he resolved, if possible, to teach himself that he must turn away from looking after her, and in order to do this he must learn to look steadfastly in another direction. Therefore it was that with steadfast heart and resolute eyes he looked at Miss Burns.

Miss Burns was a young lady who stood behind the gentlemen's furnishing-goods counter of a large dry-goods store directly opposite Vatoldi's. John had bought cravats and gloves of her, and she, in turn, had taken many a meal at Vatoldi's. There were those of her companions who asserted that she thus sacrificed economy to convenience, because there were other restaurants, not far distant, where she could have been served more cheaply. Miss Burns liked Vatoldi's, and John had reason to believe that she also liked him, for in the two years during which they

had interchanged patronage he had found frequent opportunities of making himself agreeable to her, and she had shown that he was agreeable. She was a girl of pleasant appearance, although a trifle over-thin; but John liked thin girls, and until his regard for Miss Stull began to crystallize itself into yearning, his occasional intercourse with Miss Burns had been exceedingly pleasant to him. But for months and months he had almost forgotten her. For her there was no corner in the refrigerator, nor any corner in his heart.

This change of manner had been noticed by Miss Burns, and for some time before the troubles began at Vatoldi's, she had been forced to admit that it would have been just as well for her to study economy at the expense of convenience, and to take her midday meal at the restaurants frequented by her companions. But lately she had had a desire to view the renewed glories of Vatoldi's, and had several times visited the place. John had noticed her, and once had spoken to her, but there was that in his manner which showed the young woman that even this attention she owed entirely to his memory. But, as has been said, John had come to the determination to occupy his saddened eyes by turning them in the direction of Miss Burns.

It was about this time that there was brought to the restaurant a quantity of very choice clams. These were of such unusually attractive appearance that John bethought himself of exhibiting some of them on a long inclined shelf near his desk, on which were occasionally displayed some extraordinary fine specimens of fish, flesh, or fowl. To this work he devoted some comparatively leisure moments of the morning. As he arranged them on the shelf, his meditative soul began to influence his hands, and he formed the clams into letters, and gradually into words. He soon became much interested in his work, and selecting the smallest of the shell-fish, and carefully placing them, he formed a sentence in clams, which, in large letters, ran the whole length of the shelf. It read:

"Gone are all the hopes I cherished."

Stepping back, John gazed at his work with much satisfaction, and several of the waiters remarked upon it with approbation.

"You might have a new piece of poetry there every day," said one.

John smiled sadly. His desire for poetic selections was now very limited.

A little before one o'clock that day there entered into Vatoldi's Miss Matilda Stull. She was shopping in that region, and she wanted her luncheon. She expected, of course, that she would see John People there, but that made

no difference to her; she had no intention of deserting her favorite restaurant because this young man happened to be the manager of it. She was well aware that she had led him by a very short string during the period in which she had hoped to make use of him, but she did not believe that here, in his place of business, he would presume upon that familiar intercourse which in the country is allowed among persons of different classes. If, however, anything of the kind should occur, she knew well how to treat it; and she entered Vatoldi's with all freedom and confidence.

The room was well filled, but she had not made three steps within the door before John saw her. A thrill went through him, and he stopped to conceal the consequences of it which appeared in his face. In a moment, however, he raised himself, and went on with his duties, keeping his eyes upon the work before him. He did not dare to look at her, for fear she would not recognize him, and that would be a jagged wound. It would be better for her to think he had not seen her. At any rate he must have time to grasp the situation,—a very unexpected one to him, for he had supposed the lady to be in the country.

But it was not long before he found it impossible to avoid raising his eyes in her direction, and as he did so he met her glance. With a very slight smile which bore no sign of friendship, but merely indicated that acquaintance which, in the way of business, one might have with another, she beckoned him to her. Surprised and very much embarrassed by this action, John went to her.

"Mr. People," she said, "how do you do? I would like to have the clams in those first three words," pointing as she spoke, "for my luncheon. Will you please have them stewed for me?"

John turned and gazed somewhat blankly at the sentence he had formed. "'Gone are all' won't make a full stew," he said. "Those clams are very small."

"They will be quite enough," said Miss Stull. "Please order them cooked."

There was a look which accompanied this injunction that would have convinced John, if he had needed convincing, of the absolute truth of what Gay Armatt had said to him. He turned without speaking, and walking to the shelf, gathered up, with his own hands, the clams which spelled "Gone are all." He handed them to an attendant, and ordered them stewed for the lady at the table opposite, and then stepped back to his desk, his heart like a clam within him.

In about five minutes he raised his eyes at the opening of the door, and he beheld Miss Burns entering. He looked at her for a mo-

ment, and then his blood, which apparently had been greatly occupied elsewhere, came up into his face. He stood more erect, his whole body seemed to stiffen, and with a sudden resolve he walked to the new-comer, who sat behind Miss Stull, and much nearer the door.

"Miss Burns," said he, "we have some very fine clams to-day. Will you let me have a stew made for you?"

Gratified by this attention, Miss Burns immediately gave her assent. John now quickly stepped to the shelf, threw aside the last two letters of his sentence, and gathering up the clams which formed "the hopes I cherish," sent them to be stewed.

Miss Burns, following John's movements, saw the words before the clams were swept together, and, stooping, fumbled with the buttons of one of her boots.

The waiter thought the stew would be a large one, but he made no remark. There was something in John's eye which showed that he meant what he did.

Miss Stull, who was waiting for her stew, and had turned half around when John left the desk, saw the whole proceeding. It brought upon her face a smile, a very different one from that which had last been there, and a very good smile for John People.

XXIX.

ON the day of his arrival at his farm Mr. Stull drove over to the county town, and had an interview with Zenas Turby. That energetic collector of debts and facts had made a very favorable report in regard to the iron on the Bullripple farm; and Mr. Stull now also received valuable information concerning the Western heirs to the farms held by himself and Enoch. These persons had been made acquainted by Mr. Turby's letters with the loss and injustice they had sustained, and of the fact that although the property in question was not very valuable, it was quite certain, if the affair were properly managed, that they could come into their rights without expensive process of law; the case being so plain that the parties in possession would probably not think it worth while to resist the setting aside of the illegal transfer and the immediate sale of the property with a rightful division of the proceeds.

"They must think," said Mr. Stull, "that the parties in possession are very great fools to give up what they have paid for without making a fight for it; but if it is to our advantage to appear foolish, let us do so by all means. I am perfectly willing to decline to throw good money after bad in defending my title, and as

to that man Bullripple, I imagine there will not be much trouble in making him take the same position, for I don't believe he can afford to go to law about it."

"Not he," sneered Mr. Turby. "When he can pay his taxes he is doing very well."

"What we have to do now," said Mr. Stull, "is to have the matter legally arranged as quickly as possible, and the sale ordered. I shall then buy both tracts."

"You will get them cheap," said Turby, "for there's nobody in these parts who will care to bid against you."

Mr. Stull wanted, of course, to get the land as cheaply as possible, having already paid for part of it; but as the amount paid had not been very large, he would have preferred to lose that, and to give a fair average price for the two farms, rather than to hold one of them by a tenure which would make it impossible for him to dispose of it justly, and unadvisable to invest any money in its improvement and development. His business sagacity had never before allowed him to buy property to which he could not receive a good title, but the opportunity to become possessed of the late Mr. People's farm for a small sum had been a tempting one, and had caused Mr. Stull to close the bargain and take his chances as to future settlement with heirs who might or who might not turn up. His chance now, he thought, was very good, and even if the land should not be valuable from a mineral point of view, he would be glad to have a large and extensive country place in this picturesque region.

"I will see Bullripple myself," he said to Turby. "I think I can make him understand that his wisest course will be to step aside and make no opposition. And, by the way, you can mention to those Western people that it might be well for them to offer some inducements to the parties in possession to vacate their claims. Considering that we have paid our money, they ought to do that."

"I'll put that to them," said Turby, "and if they agree, it ought to help persuade that thick-headed Bullripple to step out."

The next morning Mr. Stull called upon Enoch, and appeared before him in the light of an injured man. His sense of injury, however, was mingled with a solemn dignity which forbade any violence of expression.

He told Enoch of the information he had received concerning the Western heirs, and then he added: "You have brought me, sir, into a very annoying predicament; a situation, I may say, which is unworthy of me."

"I'd like to know what I had to do with it?" asked Enoch.

"You had a great deal to do with it," re-

plied Mr. Stull, with lofty severity. "You were apparently a man of probity in this vicinity, and you were the alleged owner of a property which had been acquired at the same time and in the same way as that which had belonged to your brother-in-law, and which I bought. With your example before my eyes, there was no reason why I should hesitate to pay my money for that land."

"Considering how little you paid," said Enoch, "I don't think you had any reason to hesitate."

"That land, sir," continued Mr. Stull, without attention to the last remark, "as I am now informed, does not belong to me any more than this land belongs to you. But I have not come here to make reproaches. There are some losses which my self-respect teaches me to accept and say nothing about. I am here simply to know what you intend to do in the matter. If it is carried to the courts, I have no case, and you have no case. That will simply be a great expense and much annoyance, and the loss of the land the same as if we had not gone to law. Now I consider that the proper, the honorable, and the honest course is for me and for you to accept the situation, to cease to insist upon an ownership in lands for which we have not paid all the rightful owners, and to accept whatever terms said owners are willing to offer us. Now, sir, do you intend to join me in this just and honorable course? Or do you propose to act in a stubborn and litigious manner, and so bring trouble and expense upon all concerned?"

Mr. Bullripple sat with his eyes half shut and fixed upon the ground. "It may be," he thought, "that this land has iron in it after all." Then he replied to Mr. Stull. "I can't say," said he, "upon a suddint this way, jus' exactly what I'll do. But I do declare it doesn't look a bit like you to give up this way jus' as soon as the thing is mentioned."

"When I am right," said Mr. Stull, with much loftiness, "I never give up; but when I am wrong, I deem it my duty to do so without delay, and I hope, sir, that you will see that it is also your duty as well as your interest."

"Well, Mr. Stull," said Enoch, rising, and taking two strides with his hands in his pockets. "I'll think it over, and see what is best to be done. And I guess the first thing to be done is to wait till we hear something positive from those fellows in the West."

"I have said all I have to say," said Mr. Stull. And he took his leave.

"Bullripple is too stupidly obstinate to agree with anybody," he said to himself as he walked away, "but if I give in, he'll have to."

Enoch was a good deal more disturbed by Mr. Stull's information than he had appeared

to be. He had heard of these Western heirs, but had never put much faith in them, and he had believed, moreover, that his possession would in time give him a valid title which would be good against all claims. But he had never given himself any trouble to ascertain the existence or non-existence of other claimants, and had taken no legal measures, in fact, to protect himself in case claims should be brought.

Nothing, however, so disturbed his faith in the strength of his tenure of his farm as the fact that Mr. Stull had admitted that the title to his own farm was not a good one. He had never liked Stull, and since his discovery of the ownership of Vatoldi's he had had a thorough contempt for the man. But he knew him to be an unusually astute business man, and when Mr. Stull stated that his title to a piece of property was not good, there was as much reason to believe that he had thoroughly examined the case and was correct in his view of it, as there was to believe that he never would have made the admission if it were possible to avoid it.

But Enoch's belief in Mr. Stull's business sagacity went still further. "That pie-man," he thought, "is pushin' this thing, and he wouldn't do it if he didn't expect to make somethin' out of it. If there wasn't no more of it than what he told me, he'd jus' keep quiet and let other people do what had to be done. Yes, sir," he said aloud to himself, after he had taken a few meditative turns with his hands in his pockets, "there's more in this thing than he wants me to see. It may be iron, and it may be something else; but, whatever it is, the pie-man is on the grab for it."

Mr. Bullripple thought over this matter all the rest of the day and a good part of the night; and in the morning he laid the subject before Mr. Stratford. That gentleman listened with much attention; he was always interested in Enoch and his concerns. But before he could form any opinion in regard to the case, Mr. Bullripple, who was one of those persons who ask counsel of others for the purpose of having their own decisions supported, proceeded to give his views.

"Of course I can't tell," said he, "exactly what that Stull is after, but I've given my brains a good badgerin', and I've pretty well made up my mind that when the whole thing is settled, it'll be Stull that's got these two farms, and not them Western men. And when that's happened, I may as well get ready to walk, for he hates me wuss than he hates the devil."

"Why should that be?" asked Mr. Stratford, surprised.

"Oh, well," said Enoch, "he and I once

had a little business together, and I got the better of him. It's not a thing I can talk about; but it made him hate me; there's no gettin' 'round that."

Remembering all that Enoch had told him at Vatoldi's about his being in search of a rat in a hole; and assuming, for he had never been so informed, that this search had been successful, it was not difficult for Mr. Stratford to put this and that together. He reflected that Enoch, who was always very free-spoken about his affairs, had never told him the result of his hunt for the rat, and had just admitted that he had had a piece of private business with Mr. Stull of which he could not speak, and it was natural that in Mr. Stratford's mind said Stull and said rat should merge themselves into the same personality.

This conclusion surprised Stratford very much. If Enoch had been earnestly looking for some one, it was tolerably certain that there was some one to look for, and he knew no reason why that some one should not be Mr. Stull. Stratford knew the man but slightly, and cared little for what he knew. It was, therefore, a matter of small concern to him that the bank president sold oyster stews, but it was a matter of very great concern that Enoch had discovered the fact. This old farmer was a man whose character and methods deserved careful study.

"Now this is the way I've worked it out," continued Enoch. "If what Stull says is so, and I'm inclined to believe it is, for he wouldn't come to any man and tell him that he didn't fairly own any particular thing, if there was the least chance in the world of his keepin' it without fairly ownin' it, then I'm of the opinion that the quicker somethin' is done the better."

"What would you do?" asked Stratford.

"What I'd do," said Enoch, "would be this: I'd go straight out West, and see them other heirs. I'd look into their claims and see how good they was. It wouldn't cost much to do that. Then, if everything was all straight, I'd jus' ask 'em what they'd take for their claims. If they had any sense at all they'd rather take a middlin' fair price down in cash than to go to a lot of trouble and perhaps have the land sold for mighty little. I think I could put all that before 'em so's they could see it. Then I'd come home and go to somebody,—say to you, Mr. Stratford,—and borry the money I'd have to pay down; I'd be mighty keerful, too, to hunt up any other heirs, if there was any, and buy up their claims. When that was all done, I'd take the same law steps that them fellows would 'a' took, and when the case was settled, the property needn't be sold to divide the money, for

there'd only be one owner to the whole of it, and that would be me. When I'd got the deed all safe in my possession, I'd give the man who lent me the money — he'd have to trust me till then — a mortgage on the whole property. Then there couldn't be no turnin' out of house and home. I'd go on here the same as ever, payin' a fair and reg'lar interest on the mortgage. And as for Stull, if he likes that place, he could just live there as long as he liked, and I'd put the rent high enough to cover the interest I'd have to pay on the two places. If he didn't want to do that, he might go, and that farm could easily be sold for enough to pay off the whole mortgage. Now, isn't that a pretty straight and even plan? With all the iron left out, too, for that's a thing I don't believe in."

Stratford laughed. "It certainly is an ingenious plan, and may hold together. If I were you, I'd try it. I fear there are some weak points in your scheme, but they may not prevent its success. At all events, you would lose nothing by the trial, and I should be very sorry indeed to see this farm taken from you."

"Well, sir," said Enoch, "that's what you'd do if you was me. Now then, bein' yourself, would you advance me the money, and then take a mortgage on the land for it?"

"Yes," said Mr. Stratford, "if the facts are what you suppose them to be, and all the heirs are willing to sell out their claims, I'll advance the money."

"Good!" cried Mr. Bullripple, slapping one hard palm with the other. "And now I'll see if I can't match farm work ag'in' pie-bakin'."

"Enoch," said Mr. Stratford, with a smile, "you said too much that time."

"Perhaps I did," said the old farmer, "but slips don't count."

As he walked away Mr. Stratford felt more than ever convinced that if Enoch Bullripple, instead of being driven from his farm by the revengeful Stull, should succeed, without loss to himself or to any one, in making that lofty personage pay him rent for his present country-seat, he would add very much to his previous claims to be considered a hundredth man. It was not the old farmer's cleverness and natural cunning that Stratford considered in this connection; it was his willingness, as shown in his extraordinary conduct at Vatoldi's, to throw himself, for the purpose of gaining his ends, into a position which nobody else would be likely to think of, or be courageous enough to take, which made our friend imagine that, in all probability, his search for a man, entirely unique and exceptional, had, at last, met with success.

xxx.

GAY ARMATT did not find the presence of Mr. Thorne in the Cherry Bridge neighborhood that interruption to her studies and daily pursuits which she had supposed it would be. Her expectations had been that Mr. Stratford would find it necessary to give so much of his time to his friend that very little of it would be left for her. Of course there were studies and a good many daily pursuits which could very well be carried on without the presence of Mr. Stratford, but this did not suit Miss Gay. She had become accustomed to Stratford's helpful counsel and to the pleasure of his society. She liked them, and she did not wish to give them up. She was sitting at the feet of a master, and it would have greatly grieved her had circumstances compelled her to rise.

But Arthur Thorne did not prove to be such a circumstance. On the contrary, he was scrupulously careful not to interfere with the life which Gay was now leading. Stratford determined to go on with his visits to Mrs. Justin and his intercourse with Gay as if Thorne had not been there; while the younger man determined that his intercourse with Gay should be largely influenced by the fact that Stratford was there. It was not his object to endeavor to supplant Stratford; this he knew he could not do; all he hoped was to make himself known, and perhaps favorably known, to the woman he loved. If then Stratford held to his word, his opportunity might come; at all events, he would not be a stranger to Gay Armatt. That point in Stratford's argument had made a strong impression on him.

It was Thorne's custom to walk over from the Cherry Bridge tavern in the afternoon, and often in the evening, and if he could talk or walk with one or both of the ladies, or play croquet with them, or do for them anything which they might wish him to do, he was very glad. If it happened that Stratford were there, and it often did so happen, Thorne showed no indisposition to join in any general occupation, though he avoided thrusting himself into any special one. He took the goods the goddesses gave, and was very thankful.

Mrs. Justin noticed all this, and though she really wished Mr. Thorne would stay away, she could not help honoring him for his thoughtful and courteous conduct. His visits could not be pleasant to her, favoring, as she did, a union between Stratford and Gay, but no man that she knew could have brought upon himself under similar circumstances so small a taint of unpleasantness.

Gay did not know Mr. Thorne's object in coming to the house, but she soon found that,

as far as she was concerned, his coming made no difference. This was very pleasant, and made her look upon the gentleman, especially at first, as an agreeable addition to their little circle. She could not but see, too, although it did not strike her mind as soon as it did that of Mrs. Justin, how he refrained from putting himself in those paths which she and Mr. Stratford were wont to walk together. For that she liked Mr. Thorne better than for anything else.

As the days went on, the ladies of the Justin household began to appreciate the fact that two gentlemen friends were better than one, because the little vacancies and gaps which must occasionally be left by one of them could almost always be filled by the other. A more useful and agreeable second man than Mr. Thorne could scarcely be found. In most cases he was perfectly able to take the place of first man, and yet he was always willing to fall into the subordinate position. Thus indicated mental endowments of a kind very rare and very valuable.

Though Mr. Stratford was a frequent visitor at the Justin house, he did not come every day, and sometimes, of a morning, Arthur Thorne would stand and lean against the railings of the shady piazza where Gay was in the habit of doing her reading and studying, which, by the way, had become much more of a habit than in the early summer. At such times he did not stay very long, nor say very much, but it cost him an effort, which only a strong man could have given, to tear himself away and leave Gay undisturbed with her books. Several times Mrs. Justin noticed this proceeding, and she could not refrain from giving Mr. Thorne her unqualified admiration.

On one of these occasions Thorne remarked to Gay: "I wish very much, Miss Armatt, that there was something inside the vast scope of human knowledge which I could help you to study. There ought to be something, but I don't believe there is."

Gay smiled. "I expect there are ever so many things," she said, "that you could teach me from beginning to end."

Thorne shook his head. "No," said he, "your studies are extensive enough already, and there is nothing I would undertake to teach except law; and in that, of course, you would take no interest."

"I am not so sure of that," said Gay. "There are a great many things about law which a woman ought to know, especially those things which particularly concern her, and of which I am totally ignorant."

"And would you like to know them?" eagerly asked Thorne.

"Certainly," answered Gay. "The object of my life, Mr. Thorne, is to know."

As she said this a little shade of darkness crept into that young face, which Thorne had never seen there before. It was so slight a shade that most persons would not have noticed it, but Thorne marked it, and referred it to the fact that a little while ago this young person had another object in life, which, in a tangible and acknowledged form, did not now exist.

"If you will allow me, Miss Armatt," he said, "it will give me very great pleasure to indicate to you some points of law which I really think you ought to understand, and without a knowledge of which, I do not hesitate to say, I believe no person should be called thoroughly educated. I can write out the points to which it would be well to direct your attention, and give you authorities and references which you can make use of if you like. Then you can look into the subject at your convenience, and I can always furnish you with any books you may want."

"You are very kind indeed, Mr. Thorne," said Gay, "and I think your suggestion a sensible and practical one. There are many general principles of law, and particular applications too, which I am sure would be of use to me, and which I really ought to know if I ever expect to call myself well informed. It would be entirely too much for you to write out subjects and references, as you are so good as to suggest, and I would not ask you to put yourself to so much trouble; but if you could talk over the matter with me when it is perfectly convenient to you, I should be very much obliged indeed. It wouldn't interfere at all with my other work, for I have plenty of spare time."

As Gay said this she had a consciousness that she was conferring a favor, and that it was pleasant to confer it. She was entirely honest in the expression of her desire to know something of the laws under which she lived; but she also felt that Mr. Thorne was a young man of such kindly disposition that it was a kindness to him to give him an opportunity to be kind.

Mr. Thorne was charmed. He went away to his room in the Cherry Bridge tavern, and set himself to work to prepare from the resources of his very extensive information a concise but comprehensive summary of some of the fundamental principles of law which everybody ought to know, and also of such specific points as women in particular ought to know. The work interested him greatly, and it was not until his lamp burned out that night that he laid down his pen. Early the next morning he hired a horse and

rode over to the county town, where he asked the privilege from a lawyer to make abstracts from some of his legal books.

It was several days before Arthur Thorne had prepared to his satisfaction his ground plan of the legal education of Gay Armatt. When it was finished he betook himself to the Justin mansion with his papers in his pocket, determined on no account to obtrude the matter upon her attention did not a favorable opportunity present itself.

His opportunity came immediately. He found Gay and Mrs. Justin sitting together, and the young lady received him with unusual cordiality.

"I hope, Mr. Thorne," she said, "that you have come prepared to talk law. I have thought of no less than four things that I want to ask you immediately, although I suppose you will wish to begin with *Magna Charta*, or some such foundation-stone."

"I am quite ready," he said, pulling out his papers, "and *Magna Charta* can wait. Now, what are your four points?"

Mrs. Justin had been told by Gay of the proposed plan of legal instruction, and she had not favored it. It would give Thorne too many advantages, and besides, she thought that Gay was working too hard already. But her young friend set aside all her objections. These things would be but trifles, she declared, and even were it otherwise, she had never felt so much like work in her life.

Mrs. Justin had not withdrawn her objections, but after a little talk with Mr. Thorne she withdrew herself, and left the two to settle the four points. When, that evening, she told Mr. Stratford of Gay's new course of study he did not object.

"It seems rather an odd thing to do," he said, "but then Gay Armatt is somewhat of an odd young lady, and as for Arthur Thorne, although he is generally most oddly proper, I have found that, upon occasion, he can be properly odd."

Mrs. Justin shrugged her shoulders. "I do not like it at all," she said.

"I think I do," replied Stratford. "A certain amount of knowledge of that kind will be very useful to Miss Armatt, and Thorne is just the man to give it to her."

"He is just the man who should not give it to her," quickly replied Mrs. Justin. "Horace Stratford, you are either blind or wickedly foolish."

"My dear friend," said Mr. Stratford, "I wish that I could make you understand that I am neither."

"That you can easily do," said Mrs. Justin, "by marrying Gay." And there the conversation stopped.

Not every day, but still often, Gay and Arthur, with a great deal of earnest interest on each side, pursued their legal studies. It was but a slight skeleton of a course of study, but it was one calculated to place a woman in a position of intelligence with regard to her relations with her fellow-beings which would give her great advantages over other women who did not occupy that position. To Gay it was all very pleasant; it helped and satisfied her desire to make herself thoroughly well informed and cultured. To Arthur Thorne it was heaven.

The weeks passed on, and touches of red and yellow began to appear here and there in the foliage, while the days became so perceptibly shorter that those who drove out in the afternoon frequently came home under the twinkling light of the evening star. The accustomed intercourse of Stratford and Gay continued without a change, except that it now received from Mrs. Justin certain favoring impulses which, before, she had not been wont to give it; and the occasional intercourse of Gay and Thorne became more friendly and easy, in spite of the absolute want of encouragement shown to it by Mrs. Justin.

Had any one appeared in the neighborhood of Cherry Bridge and declared that at any season of the year in any part of that country there was the slightest trace of malaria, he would probably have fared badly. Mrs. People would have been glad to scratch the skin from his defaming face, and if no one, in fact, should offer to him personal injury, he would have been so borne down with contempt and condemnation that he would have yearned to flee to some region the pride of whose people in their healthy surroundings he had not shocked.

Mrs. Justin was very prudent concerning public opinion. Upon no account would she say a word against this general belief in the healthfulness of the neighborhood. But in her own mind she now began to be of the opinion that Gay Armatt was suffering from some sort of malarial influence. She was not at all the same girl she was when she came to that Cherry Bridge country. Her mental activity was as great as ever, but she could now be tired by a moderate walk, or even a very long drive. There were other indications of an unsatisfactory state of health, which were not generally noticeable, but easily perceived by the quick eye of Mrs. Justin. At first she attributed Gay's apparent decrease in physical stamina to her studies, but she soon gave up that idea. The work done by her young friend was not enough to injure any healthy person of her years, and it was intermingled with constant recreation and outdoor life. There was something too much of it, and it

might occasionally have made Gay appear a little weary. But the effects of study were not sufficient to account for the symptoms Mrs. Justin noticed.

The village doctor was called in, and he prescribed a tonic, but this was of no benefit; and therefore it was that Mrs. Justin privately made up her mind that there were in the atmosphere malarial influences to which Gay was peculiarly susceptible, and that she would not be better until she should go away.

If Gay had moved, or had been lowspirited, or had shown any symptoms of retrospective melancholy, Mrs. Justin would have attributed her condition to the broken engagement. But there was nothing of the kind. Gay had behaved admirably after her great trial. She had kept up her spirits, and it was only in physical action that she showed any decrease in strength and activity. This state of mind Mrs. Justin attributed in great degree to the influence of Mr. Stratford. There was no possible doubt of the fact that Gay could not so constantly associate with him without discovering by contrast the inferiority and unworthiness of the man who had left her.

Having determined that Gay's health demanded a complete change of scene and air, Mrs. Justin also considered it her duty to bring about that change without loss of time; she therefore made the necessary preparations to go to her winter home in New York. Gay expected at the end of her Cherry Bridge sojourn to spend some time with her relatives in Maryland, but this Mrs. Justin would not allow. The country at this season was evidently no place for Gay; she must go to the city. In the course of a week the Justin house was closed, and Gay and its owner had departed for New York.

Mr. Thorne had already gone home. He had not had so many of those delightful interviews with Gay as he would have liked to have, and he had not taught her a quarter as much law as he would have wished to teach her. But he had seen her frequently, and his course had been so well begun that it would be easy to take it up at any time; and, on the whole, Mr. Thorne was well satisfied; nay, more, he was warmed and exhilarated by his sojourn at Cherry Bridge. To give himself this special holiday he had broken away from his professional pursuits and had left his business in the hands of an associate. But he did not in the least reproach himself for this departure from his usual habits of life. Nothing could be wiser than to give a few weeks to the furtherance of an object which was more important to him than any other object could possibly be.

Mr. Stratford remained at the Bullripple farm. The partridge season had begun, and

there was no reason why he should not stay in the country as long as he had hitherto been accustomed to stay. It was true that the region seemed more lonely than in former years when he had been there by himself, and he thought he was a little tired of the country. But it would have been ridiculous for him to have hurried away after Mrs. Justin and Gay. He promised himself, however, and indeed he had said as much to the ladies, that he would not stay among the mountains very long. His promise to himself was partly based on conviction that Gay's future happiness might depend in a greater degree on his presence in the city than it had lately depended on their companionship out here. What sudden exposure to her former peril might there occur he did not know.

One afternoon Stratford came, with his gun and his setter dog Felix, to the rail fence on the top of the little eminence from which he and Gay had once watched the sunset. He seated himself on the top rail of the fence, and thoughtfully gazed over the landscape towards the western sky. Suddenly his eyes fell upon two persons emerging from the grove of sugar-maples on the level ground beneath him. It was Miss Matilda Stull and a gentleman, whom, to his astonishment, he speedily recognized as Mr. Crisman. They did not come up towards him, but turned away, walking along the bottom of the hill. Their very intimate manner as they moved away, hand in hand, gave assurance that they had not noticed Stratford, and the very intimate converse in which they were evidently engaged gave good reason for their not noticing anything but themselves.

Stratford could scarcely explain to himself why the appearance of these two persons, for whom he had such slight regard, should have such a sudden and disturbing effect upon him. He had heard from Mrs. People that Miss Stull and her mother had returned to the farm, but he had known nothing of Crisman's presence in the neighborhood. It was simply impossible to doubt the relations of these two young persons to each other. The expression of their faces, and their whole demeanor and action, showed that they were lovers.

Nothing should have given Stratford greater satisfaction than this. If Crisman were in love with that young woman down yonder, Gay's peril was over. But, instead of a thrill of pleasure, Stratford felt a shock. His soul was filled with a startling conviction that his work was done; that he had carried Gay Armatt over the gap!

Slowly, and without noticing the world beneath his feet, or the sky above him, Stratford descended from the fence and walked homeward.

Frank R. Stockton.

(To be continued.)

SUNKEN GRAVES.

THIS summer eve I wander where the dead
Sleep out the centuries which roll o'er-
head,
And question who they were that laid them
down,
Unwakeful, at this last inn of the town,
Till an emotion, unexpressed as yet,
Swells in my bosom like a vast regret.

There was a day when all this church-yard
street
Throbbled at the passing of the mourner's feet;
There was a time when every ended year
Brought unforgetful ones to drop a tear.
What now is left, save that the grasses grow
A little ranker since they dewed them so?

There is the sky; and just as faint and far
Swims through the twilight deeps the evening
star.
And there the mountain juts into the night,
Mantled with green, and canopied with white;
While yonder orb, before it sinks to rest,
Slants these long moonbeams from the darken-
ing west.

There too, a bird, upon a tree's long limb,
Has built her nest without a thought of him
Within whose grave the maple's spreading
root
Unawed adventures to intrude its foot,
Above whose breast the summer's dewy tears
Have lightly sifted for uncounted years.

None live who knew him. There are none
to say
Where lived, whom loved, what wrought, when
passed away,

This one who, doubtless, had the daily care
And hourly travail of his soul to bear,
But sleeps with none to marvel o'er him save
The stranger musing by his sunken grave.

Would *they* remember? Could I break their
rest
Who sleep, far-scattered from the east to west,
And with such question from the earthly
gloom
Could vex the dreamless slumber of the tomb,
Would they recall what pulseless lump of clay,
Void of the spirit, here was laid away?

Dead are the dead: nor could there come
reply.
They could not answer to the call; but I—
I and the living answer! Breath by breath
Some hope we cherished trembles to its death;
Some fond illusion of the spirit dies,
And fades the glory of our summer skies.

The hope, the vision, lay we well at rest;
We scatter lilies on each quiet breast;
We say at heart, with mute lips stricken dumb
For grief of sad to-morrows ere they come:
"Within this grave our sun of life is set!
Never shall we this day or grief forget!"

Then go our ways. . . . But when our spirits
pass
Through glebes unconquered from their native
grass,
And, swift and sweet our quickened senses get
A perfume rarer than the violet,
We never dream that all this verdure waves
Above our hopes' long-lost and sunken graves.

Andrew B. Saxton.

LINCOLN'S COOPER INSTITUTE SPEECH,

AND OTHER POLITICAL EVENTS OF 1859-60.

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

LINCOLN'S OHIO SPEECHES.

WHEN Lincoln, in opening the senatorial campaign of Illinois, declared that the Republican cause must be intrusted to its own undivided friends who do care for the result, he displayed a much better understanding of the character and aims of his opponent than those who, not so well informed, desired the adoption of a different course. Had the wishes of Greeley and others prevailed, had Douglas been adopted by the Illinois Republicans, the party would now have found itself in a fatal dilemma. No sooner was the campaign ended than Douglas started on a tour to the South, and began making speeches apparently designed to pave his way to a nomination for President by the next Democratic National Convention. Realizing that he had lost ground by his anti-Lecomptonism, and especially by his Freeport doctrine, and having already felt in the late campaign the hostility of the Buchanan Administration, he now sought to recover prestige by publishing more advanced opinions indirectly sustaining and defending slavery.

Hitherto he had declared he did not care whether slavery was voted down or voted up. He had said he would not argue the question whether slavery is right or wrong. He had adopted Taney's assertion that the negro had no share in the Declaration of Independence. He had asserted that uniformity was impossible, but that freedom and slavery might abide together forever. But now that the election was over, and a new term in the Senate secure, he was ready to conciliate pro-slavery opinion with stronger expressions. Hence, in a speech at Memphis, he cunningly linked together in argument unfriendly legislation, slavery, and annexation. He said:

"Whenever a territory has a climate, soil, and population making it the interest of the inhabitants to encourage slave property, they will pass a slave code."

Wherever these preclude the possibility of slavery being profitable, they will not permit it. On the sugar plantations of Louisiana it was not a question between the white man and the negro, but between the negro and the crocodile. He would say that between the negro

and the crocodile, he took the side of the negro; but between the negro and the white man, he would go for the white man. The Almighty has drawn the line on this continent, on the one side of which the soil must be cultivated by slave labor; on the other by white labor. That line did not run on 36° and 30' [the Missouri Compromise line], for 36° and 30' runs over mountains and through valleys. But this slave line, he said, meanders in the sugar fields and plantations of the South, and the people living in their different localities and in the territories must determine for themselves whether their "middle bed" is best adapted to slavery or free labor.

Referring to annexation, he said our destiny had forced us to acquire Florida, Louisiana, Texas, New Mexico, and California. "We have now territory enough, but how long will it be enough? One hive is enough for one swarm of bees, but a new swarm comes next year and a new hive is wanted." Men may say we shall never want anything more of Mexico, but the time would come when we would be compelled to take more. Central America was half-way to California and on the direct road. The time will come when our destiny, our institutions, our safety will compel us to have it. "So it is," concluded he, "with the island of Cuba. . . . It is a matter of no consequence whether we want it or not; we are compelled to take it, and we can't help it."†

When Douglas reached New Orleans on his trip he, in another long speech, substantially repeated these declarations and, as if he had not yet placed himself in entire harmony with Southern opinion, he added a sentiment almost as remarkable as the "mud-sill" theory of Hammond, or the later "corner-stone" doctrine of Stephens:

"It is a law of humanity," said he, "a law of civilization, that whenever a man or a race of men show themselves incapable of managing their own affairs, they must consent to be governed by those who are capable of performing the duty. It is on this principle that you establish those institutions of charity for the support of the blind, or the deaf and dumb, or the insane. In accordance with this principle, I assert that the negro

† Douglas, Memphis speech, Nov. 29th, 1858. Memphis "Eagle and Enquirer."

race, under all circumstances, at all times, and in all countries, has shown itself incapable of self-government." *

Once more, in a speech at Baltimore, Douglas repeated in substance † what he had said at Memphis and New Orleans, and then in the beginning of January, 1859, he reached Washington and took his seat in the Senate. Here he now began to comprehend the action of the Democratic caucus in deposing him from the chairmanship of the Committee on Territories. His personal influence and prestige among the Southern leaders were gone. Neither his revived zeal for annexation, nor his advanced views on the necessity for slave labor restored his good-fellowship with the extremists. Although, pursuant to a recommendation in the annual message, a measure was then pending in the Senate to place thirty millions in the hands of President Buchanan with which to negotiate for Cuba, the attitude of the pro-slavery faction was not one of conciliation, but of unrelenting opposition to him.

Toward the close of the short session this feeling broke out in open demonstration. On February 23d, while an item of the appropriation bill was under debate, Senator Brown, of Mississippi, said he wanted the success of the Democratic party in 1860 to be a success of principles and not of men. He neither wanted to cheat nor be cheated. Under the decision of the Supreme Court the South would demand protection for slavery in the Territories. If he understood the senator from Illinois, Mr. Douglas, he thought a Territorial legislature might by non-action or by unfriendly action rightfully exclude slavery. He dissented from him, and now he would like to know from other senators from the North what they would do :

"If the Territorial legislature refuses to act, will you act? If it pass unfriendly acts, will you pass friendly? If it pass laws hostile to slavery, will you annul them and substitute laws favoring slavery in their stead? . . . I would rather," concluded he, "see the Democratic party sunk, never to be resurrected, than to see it successful only that one portion of it might practice a fraud on another." ‡

Douglas met the issue, and defended his Freeport doctrine without flinching. The Democracy of the North hold, said he, that if you repudiate the doctrine of non-intervention, and form a slave code by act of Congress, where the people of a Territory refuse it, you must step off the Democratic platform.

"I tell you, gentlemen of the South, in all candor, I do not believe a Democratic candidate can ever carry

any one Democratic State of the North on the platform that it is the duty of the Federal Government to force the people of a Territory to have slavery when they do not want it." §

The discussion extended itself to other Senators; Jefferson Davis, of Mississippi, Clay, of Alabama, Mason, of Virginia, and Gwin, of California, seconded the demands and arguments of Brown; while Pugh, of Ohio, Broderick, of California; and Stuart, of Michigan, came to the help and defense of Douglas and non-intervention. Several Republicans drifted into the debate on behalf of the position and principles of their party, which of course differed from those of both Brown and Douglas. The discussion was continued to a late hour, and finally came to an end through mere lapse of time, but not until an irreparable schism in the Democratic party had been opened.

Silence upon so vital an issue could not long be maintained. In the following June, an Iowa friend wrote to Douglas to inquire whether he would be a candidate for the presidential nomination at the coming Charleston convention. Douglas replied that party issues must first be defined. If the Democracy adhered to their former principles, his friends would be at liberty to present his name.

"If, on the contrary," continued he, "it shall become the policy of the Democratic party, which I cannot anticipate, to repudiate these their time-honored principles, on which we have achieved so many patriotic triumphs, and in lieu of them the convention shall interpolate into the creed of the party such new issues as the revival of the African slave-trade, or a Congressional slave-code for the Territories, or the doctrine that the Constitution of the United States either establishes or prohibits slavery in the Territories beyond the power of the people legally to control it, as other property — it is due to candor to say that, in such an event, I could not accept the nomination if tendered to me." ||

We must leave the career of Douglas for a while to follow up the personal history of Lincoln. The peculiar attitude of national politics had in the previous year drawn the attention of the whole country to Illinois in a remarkable degree. The senatorial campaign was hardly opened when a Chicago editor, whose daily examination of a large list of newspaper exchanges brought the fact vividly under his observation, wrote to Lincoln :

"You are like Byron, who woke up one morning and found himself famous. People wish to know about you. You have sprung at once from the position of a capital fellow, and a leading lawyer in Illinois, to a national reputation." ¶

§ Douglas, Senate speech, Feb. 23d, 1859. Globe, p. 1247.

|| Douglas to Dorr, June 22d, 1859. Baltimore "Sun," June 24th, 1859.

¶ Ray to Lincoln, July 27th, 1858. MS.

The compliment was fully warranted; the personal interest in Lincoln increased daily from the beginning to the end of the great debates. The Freeport doctrine and its effect upon the Democratic party gave these discussions both present significance and a growing interest for the future. Another friend wrote him, a few days after election:

"You have made a noble canvass, which, if unavailing in this State, has earned you a national reputation, and made you friends everywhere."*

That this was not the mere flattery of partial friends became manifest to him by other indications; by an increased correspondence filled with general commendation, and particularly by numerous invitations to deliver speeches in other States. The Republican Central Committee of New Hampshire wrote him that if Douglas came, as was expected, to that State, they desired Lincoln to come and answer him. The Central Committee of Minnesota wished him to come there and assist in their canvass. There was an incessant commotion in politics throughout the whole North, and as the season progressed, calls came from all quarters. Kansas wanted him;† Buffalo wanted him;‡ Des Moines wanted him;§ Pittsburgh wanted him;|| Thurlow Weed telegraphed: "Send Abraham Lincoln to Albany immediately."¶ Not only his presence, but his arguments, ideas, and counsel were in demand. Dennison, making the canvass for governor of Ohio, asked for a report of his debates for campaign "material."***

That men in all parts of the Union were thus turning to him for help and counsel was due, not alone to the publicity and credit he had gained in his debates with Douglas in the previous year; it grew quite as much out of the fact that by his sagacity and courage he had made himself the safest, as well as the most available, rallying-point of the Republican party and exponent of Republican doctrine. The Lecompton quarrel in the Democratic party had led many prominent Republicans on a false trail. In Douglas's new attitude, developed by his Southern speeches and his claim to re-admission into regular Democratic fellowship, these leaders found themselves at fault, discredited by their own course. Lincoln, on the contrary, not only held aloft the most aggressive Republican banner but stood nearest the common party enemy, and was able to offer advice to all the elements of the Republican party, free from any suspicion of intrigue with foe or fac-

tion. The causes of his senatorial defeat thus gave him a certain party authority and leadership, which was felt if not openly acknowledged. On his part, while never officious or obtrusive, he was always ready with seasonable and judicious suggestions generous in spirit and comprehensive in scope, and which looked beyond mere local success. Thus he wrote from Springfield to Hon. Schuyler Colfax, July 6th, 1859:

"I much regret not seeing you while you were here among us. Before learning that you were to be at Jacksonville on the 4th, I had given my word to be at another place. Besides a strong desire to make your personal acquaintance, I was anxious to speak with you on politics a little more fully than I can well do in a letter. My main object in such conversation would be to hedge against divisions in the Republican ranks generally, and particularly for the contest of 1860. The point of danger is the temptation in different localities to 'platform' for something which will be popular just there, but which, nevertheless, will be a firebrand elsewhere, and especially in a national convention. As instances, the movement against foreigners in Massachusetts; in New Hampshire, to make obedience to the fugitive slave law punishable as a crime; in Ohio 'to repeal the fugitive slave law; and 'squatter sovereignty,' in Kansas. In these things there is explosive matter enough to blow up half a dozen national conventions, if it gets into them; and what gets very rife outside of conventions is very likely to find its way into them. What is desirable, if possible, is that in every local convocation of Republicans a point should be made to avoid everything which will disturb Republicans elsewhere. Massachusetts Republicans should have looked beyond their noses, and then they could not have failed to see that tilting against foreigners would ruin us in the whole Northwest. New Hampshire and Ohio should forbear tilting against the fugitive slave law in such way as to utterly overwhelm us in Illinois with the charge of enmity to the Constitution itself. Kansas, in her confidence that she can be saved to freedom on 'squatter sovereignty,' ought not to forget that to prevent the spread and naturalization of slavery is a national concern, and must be attended to by the nation. In a word, in every locality we should look beyond our noses; and at least say nothing on points where it is probable we shall disagree. I write this for your eye only; hoping, however, if you see danger as I think I do, you will do what you can to avert it. Could not suggestions be made to leading men in the State and Congressional conventions, and so avoid, to some extent at least, these apples of discord?"*

By this time Colfax was cured of his late coquetting with Douglas, and he replied:

"The suggestions you make have occurred to me. . . . Nothing is more evident than that there is an ample number of voters in the Northern States, opposed to the extension and aggressions of slavery and to Democratic misrule, to triumphantly elect a President of the United States. But it is equally evident that making up this majority are men of all shades and gradations of opinion, from the conservative who will scarcely defend his principles for fear of imperiling peace, to the bold radical who strikes stalwart blows

regardless of policy or popularity. How this mass of mind shall be consolidated into a victorious phalanx in 1860 is the great problem, I think, of our eventful times. And he who could accomplish it is worthier of fame than Napoleon or Victor Emanuel. . . . In this work, to achieve success, and to achieve it without sacrifice of essential principle, you can do far more than one like myself, so much younger. Your counsel carries great weight with it; for, to be plain, there is no political letter that falls from your pen which is not copied throughout the Union.”*

This allusion was called out by two letters which Lincoln had written during the year; one declaring his opposition to the waning fallacy of know-nothingism, and in which he also defined his position on “fusion.” Referring to a provision lately adopted by Massachusetts to restrict naturalization, he wrote:

“Massachusetts is a sovereign and independent State; and it is no privilege of mine to scold her for what she does. Still, if from what she has done, an inference is sought to be drawn as to what I would do, I may, without impropriety, speak out. I say then, that, as I understand the Massachusetts provision, I am against its adoption in Illinois, or in any other place where I have a right to oppose it. Understanding the spirit of our institutions to aim at the elevation of men, I am opposed to whatever tends to degrade them. I have some little notoriety for commiserating the oppressed condition of the negro; and I should be strangely inconsistent if I could favor any project for curtailing the existing rights of white men, even though born in different lands, and speaking different languages from myself. As to the matter of fusion, I am for it, if it can be had on Republican grounds; and I am not for it on any other terms. A fusion on any other terms would be as foolish as unprincipled. It would lose the whole North, while the common enemy would still carry the whole South. The question of men is a different one. There are good patriotic men and able statesmen in the South whom I would cheerfully support, if they would now place themselves on Republican ground, but I am against letting down the Republican standard a hair’s breadth.”†

The other was a somewhat longer letter, to a Boston committee which had invited him to a festival in honor of Jefferson’s birthday.

“Bearing in mind that about seventy years ago two great political parties were first formed in this country; that Thomas Jefferson was the head of one of them, and Boston the headquarters of the other, it is both curious and interesting that those supposed to descend politically from the party opposed to Jefferson, should now be celebrating his birthday, in their own original seat of empire, while those claiming political descent from him have nearly ceased to breathe his name everywhere. . . .

“But, soberly, it is now no child’s play to save the principles of Jefferson from total overthrow in this nation. One would state with great confidence that he could convince any sane child that the simpler propositions of Euclid are true; but nevertheless he would fail, utterly, with one who should deny the definitions and axioms. The principles of Jefferson are the definitions and axioms of free society. And yet they are denied and evaded, with no small show of success. One dashinglly calls them ‘glittering generalities.’ Another bluntly calls them ‘self-evident lies.’ And

others insidiously argue that they apply only to ‘superior races.’ These expressions, differing in form, are identical in object and effect,—the supplanting the principles of free government, and restoring those of classification, caste, and legitimacy. They would delight a convocation of crowned heads plotting against the people. They are the van-guard—the miners and sappers of returning despotism. We must repulse them, or they will subjugate us. This is a world of compensation; and he who would be no slave must consent to have no slave. Those who deny freedom to others deserve it not for themselves; and, under a just God, cannot long retain it. All honor to Jefferson—to the man who, in the concrete pressure of a struggle for national independence by a single people, had the coolness, forecast, and capacity to introduce into a merely revolutionary document an abstract truth, applicable to all men and all times, and so to embalm it there that to-day and in all coming days it shall be a rebuke and a stumbling-block to the very harbingers of re-appearing tyranny and oppression.”‡

Lincoln’s more important political work of the year 1859 was the part he took in the canvass in the State of Ohio, where a governor was to be chosen at the October election, and where the result would decide not merely the present and local strength of the rival candidates, but also to some extent indicate the prospects and probabilities of the presidential campaign of 1860. The Ohio Democrats had called Douglas into their canvass, and the Republicans, as soon as they learned the fact, arranged that Lincoln should come and answer him. There was a fitness in this, not merely because Lincoln’s joint debates with him in Illinois in the previous summer were so successful, but also because Douglas in nearly every speech made since then, both in his Southern tour and elsewhere, alluded to the Illinois campaign, and to Lincoln by name, especially to what he characterized as his political heresies. By thus everywhere making Lincoln and Lincoln’s utterances a public target, Douglas himself, in effect, prolonged and extended the joint debates over the whole Union. Another circumstance added to the momentary interest of the general discussion. Douglas was by nature aggressive. Determined to hold his Northern followers in the new issues which had grown out of his Freeport doctrine, and the new antagonisms which the recent slave code debate in the Senate revealed, he wrote and published in “Harper’s Magazine” for September, 1859, a long political article beginning with the assertion that “under our complex system of government it is the first duty of American statesmen to mark distinctly the dividing-line between Federal and Local authority.” Quoting both the paragraph of Lincoln’s Springfield speech declaring that “a house divided against itself cannot stand,” and the paragraph from Seward’s Rochester speech, announcing

THE HOUSE IN WHICH LINCOLN LIVED IN TORRINGTON, CONNECTICUT. (REDRAWN FROM A PHOTOGRAPH LENT BY F. B. SANBORN, ESQ.)

the "irrepressible conflict," Douglas made a long historical examination of his own theory of "non-intervention" and "popular sovereignty," and built up an elaborate argument to sustain his own course. The novelty of this appeal to the public occasioned general interest and varied comment, and the expedient seemed so ingenious as to excite the envy of Administration Democrats. Accordingly, Attorney-General Black, of President Buchanan's Cabinet, at "the request of friends," wrote, printed, and circulated an anonymous pamphlet in answer, in which he admitted that Douglas was "not the man to be treated with a disdainful silence," but characterized the "Harper" essay as "an unsuccessful effort at legal precision; like the writing of a judge who is trying in vain to give good reasons for a wrong decision on a question of law which he has not quite mastered." Douglas, in a speech at Wooster, Ohio, criticised this performance of Black's. Reply and rejoinder on both sides followed in due time; and this war of pamphlets was one of the prominent political incidents of the year.

Thus Lincoln's advent in the Ohio campaign attracted much more than usual notice. He made but two speeches, one at Columbus, and one at Cincinnati, at each of which places Douglas had recently preceded him. Lincoln's addresses not only brought him large and appreciative audiences, but they obtained an unprecedented circulation in print. In the main, they reproduced and tersely re-applied the ideas and arguments developed in the senatorial cam-

paign in Illinois, adding, however, searching comments on the newer positions and points to which Douglas had since advanced. There is only space to insert a few disconnected quotations:

"Now, what is Judge Douglas's popular sovereignty? It is as a principle no other than that, if one man chooses to make a slave of another man, neither that other man nor any body else has a right to object. . . .

"If you will read the copyright essay, you will discover that Judge Douglas himself says, a controversy between the American Colonies and the Government of Great Britain began on the slavery question in 1699, and continued from that time until the revolution; and, while he did not say so, we all know that it has continued with more or less violence ever since the revolution. . . .

"Take these two things and consider them together; present the question of planting a State with the institution of slavery by the side of a question of who shall be governor of Kansas for a year or two, and is there a man here, is there a man on earth, who would not say the governor question is the little one, and the slavery question is the great one? I ask any honest Democrat if the small, the local, the trivial and temporary question is not, Who shall be governor? while the durable, the important, and the mischievous one is, Shall this soil be planted with slavery? This is an idea, I suppose, which has arisen in Judge Douglas's mind from his peculiar structure. I suppose the institution of slavery really looks small to him. He is so put up by nature that a lash upon his back would hurt him, but a lash upon anybody else's back does not hurt him. . . .

"The Dred Scott decision expressly gives every citizen of the United States a right to carry his slaves into the United States Territories. And now there was some inconsistency in saying that the decision was right, and saying too, that the people of the Territory could lawfully drive slavery out again. When all the trash, the words, the collateral matter was cleared away from it, all the chaff was fanned out of it, it was a bare absurd-

JOHN BROWN. (FROM A PHOTOGRAPH BY J. W. BLACK & CO.)

ity; no less than that a thing may be lawfully driven away from where it has a lawful right to be. . . .

"The Judge says the people of the Territories have the right, by his principle, to have slaves if they want them. Then I say that the people in Georgia have the right to buy slaves in Africa if they want them, and I defy any man on earth to show any distinction between the two things—to show that the one is either more wicked or more unlawful; to show on original principles, that the one is better or worse than the other; or to show by the Constitution, that

one differs a whit from the other. He will tell me, doubtless, that there is no Constitutional provision against people taking slaves into the new Territories, and I tell him that there is equally no constitutional provision against buying slaves in Africa. . . .

"Then I say, if this principle is established, that there is no wrong in slavery, and whoever wants it has a right to have it; that it is a matter of dollars and cents; a sort of question how they shall deal with brutes; that between us and the negro here there is no sort

of question, but that at the South the question is between the negro and the crocodile; that it is a mere matter of policy; that there is a perfect right according to interest to do just as you please — when this is done, where this doctrine prevails, the miners and settlers will have formed public opinion for the slave trade.

"Public opinion in this country is everything. In a nation like ours the popular sovereignty and squatter sovereignty have already wrought a change in the public mind to the extent I have stated. There is no man in this crowd who can contradict it. Now, if you are opposed to slavery honestly, as much as anybody, I ask you to note that fact, and the like of which is to follow, to be glistered on layer after layer, until very soon you are prepared to deal with the negro everywhere as with the brute. If public sentiment has not been detached already to this point, a new turn of the screw in that direction is all that is wanting; and this is constantly being done by the teachers of this insidious popular sovereignty. You need but one or two turns farther until your minds, now ripening under these teachings, will be ready for all these things; and you will receive and support, or submit to, the slave-trade revived with all its horrors, a slave-code enforced in our Territories, and a new Dred Scott decision to bring slavery up into the very heart of the free North."

"This Government is expressly charged with the duty of providing for the general welfare. We believe that the spreading out and perpetuity of the institution of slavery impairs the general welfare. We believe — nay, we know, that this is the only thing that has ever threatened the perpetuity of the Union itself. . . .

"I say we must not interfere with the institution of slavery in the States where it exists, because the Constitution forbids it, and the general welfare does not require us to do so. We must not withhold an efficient fugitive slave law, because the Constitution requires us, as I understand it, not to withhold such a law. But we must prevent the outspreading of the institution, because neither the Constitution nor the general welfare requires us to extend it. We must prevent the revival of the African slave-trade, and the enacting by Congress of a Territorial slave-code. We must prevent each of these things being done by either congresses or courts. The people of these United States are the rightful masters of both congresses and courts, not to overthrow the Constitution, but to overthrow the men who pervert the Constitution."

The Ohio Republicans gained a decided success at the October election. Ascribing this result in a large measure to the influence of

JOHN BROWN'S CAP. (ORIGINAL IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

Lincoln's speeches, the State Executive Committee resolved to publish in cheap book form the full Illinois Joint Debates and the two Ohio addresses, to serve as campaign material for the ensuing year.

"We regard them," wrote the committee to Lincoln, "as luminous and triumphant expositions of the doctrines of the Republican party, successfully vindicated from the aspersions of its foes, and calculated to make a document of great practical service to the Republican party in the approaching Presidential contest."†

Lincoln, thanking them for the flattering terms of their request, explained in his reply:

"The copies I send you, are as reported and printed by the respective friends of Senator Douglas and myself at the time — that is, his by his friends, and mine by mine. It would be an unwarrantable liberty for us to change a word or a letter in his, and the changes I have made in mine, you perceive, are verbal only, and very few in number. I wish the reprint to be precisely as the copies I send, without any comment whatever."‡

The enterprise proved a success beyond the most sanguine expectations. A Columbus firm undertook the publication, itself assuming all pecuniary risk. Three large editions were sold directly to the public, without any aid from or any purchase by the committee, — the third edition containing the announcement that up to that date, June 16th, 1860, thirty thousand copies had already been circulated. ||

speeches had been revised, corrected, and improved.* To this the publishers replied: "The speeches of Mr. Lincoln were never 'revised, corrected, or improved' in the sense you use those words. Remarks by the crowd which were not responded to, and the reporters' insertions of 'cheers,' 'great applause,' and so forth, which received no answer or comment from the speaker, were by our direction omitted, as well from Mr. Lincoln's speeches as yours, as we thought their perpetuation in book form would be in bad taste, and were in no manner pertinent to, or a part of, the speech."†

ONE OF JOHN BROWN'S FINGERS. (ORIGINAL IN POSSESSION OF THE KANSAS HISTORICAL SOCIETY.)

HARPER'S FERRY, AND LINCOLN'S VIEW OF
JOHN BROWN'S RAID.

AND now there occurred another strange event which, if it had been specially designed as a climax for the great series of political sensations since 1852, could scarcely have been more dramatic. This was John Brown's invasion of Harper's Ferry in order to create a slave insurrection. We can only understand the transaction as far as we can understand the man, and both remain somewhat enigmatical.

Of Puritan descent, John Brown was born in Connecticut in the year 1800. When he

was five years old, the family moved to Ohio, at that time yet a comparative wilderness. Here he grew up a strong, vigorous boy of the woods. His father taught him the tanner's trade; but a restless disposition drove him to frequent changes of scene and effort when he grew to manhood. He attempted surveying. He became a divinity student. He tried farming and tanning in Pennsylvania, and tanning and speculating in real estate in Ohio. Cattle-dealing was his next venture; from this to sheep-raising; and by a natural transition to the business of a wool-factor in Massachusetts. This not succeeding, he made a trip to Europe. Returning, he accepted from Gerrit Smith a tract of mountain land in the Adirondacks, where he proposed to found and foster colonies of free negroes. This undertaking proved abortive, like all his others, and he once more went back to the wool business in Ohio.

Twice married, nineteen children had been born to him, of whom eleven were living when, in 1854, the Kansas-Nebraska bill plunged the country into the heat of political strife. Four of his sons moved away to the new Territory in the first rush of emigrants; several others went later. When the Border Ruffian hostilities broke out, John Brown followed, with money and arms contributed in the North. With his sons as a nucleus, he gathered a little band of fifteen to twenty adventurers, and soon made his name a terror in the lawless guerilla war-

GRAVE OF JOHN BROWN, NORTH ELBA, N. Y. (REDRAWN FROM A PHOTOGRAPH LENT BY GEORGE BALDWIN, ESQ.)

fare of the day. His fighting was of the prevailing type, justifiable, if at all, only on the score of defensive retaliation, and some of his acts were as criminal and atrocious as the worst of those committed by the Border Ruffians.* His losses, one son murdered, another wounded to the death, and a third rendered insane from cruel treatment, were sorely compensated by the transitory notoriety he gathered in a few fool-hardy skirmishes.

These varied experiences give us something of a clue to his character: a strong will; great physical energy; sanguine, fanatical temperament; unbounded courage, and little wisdom; crude, visionary idealism; the inspiration of biblical precepts and Old Testament hero-worship; and ambition curbed to irritation by the hard fetters of labor, privation, and enforced endurance. In association, habit, language, and conduct he was clean, but coarse; honest, but rude. In disposition he mingled the sacrificing tenderness with the sacrificial sternness of his prototypes in Jewish history. He could lay his own child on the altar without a pang. The strongest element of his character was religious fanaticism. Taught from earliest childhood to "fear God and keep his commandments," he believed firmly in the divine authenticity of the Bible, and memorized much of its contents. His favorite texts became literal and imperative mandates; nay, more, he came to feel that he bore the commission and enjoyed the protection of the Almighty. In his Kansas camps he prayed and saw visions; believed he wielded the sword of the Lord and of Gideon; had faith that the angels encompassed him† He desired no other safeguard than his own ideas of justice and his own convictions of duty. These ideas and convictions, however, refused obedience to accepted laws and morals, and were mere fantasy and pernicious outgrowths of his religious fanaticism. His courage partook of the recklessness of insanity. He did not count odds. "What are five to one?" he asked; and at another time he said, "One man in the right, ready to die, will chase a thousand." Perhaps he even believed he held a charmed life, for he boasted that he had been fired at thirty times and only his hair had been touched. In per-

sonal appearance he was tall, slender, with rather a military bearing, in garb half deacon, half soldier‡ He had an impressive, half-persuasive, half-commanding manner. He was always very secretive, affected much mystery in his movements, came and went abruptly, was direct and dogmatic to bluntness in his conversation. His education was scant, his reading limited; he wrote strong phrases in bad orthography. If we may believe the intimations from himself and those who knew him best, he had not only acquired a passionate hatred of the institution of slavery, but had for twenty years nursed the longing to become a liberator of slaves in the Southern States. To this end he read various stories of insurrections, and meditated on the vicissitudes, chances, and strategy of partisan warfare. A year's border fighting in Kansas not only suddenly put thought into action, but his personal and family sacrifices intensified his visionary ambition into a stern and inflexible purpose.

It is impossible to trace exactly how and when the Harper's Ferry invasion first took practical shape in John Brown's mind, but the indications are that it grew little by little out of his Kansas experience. His earliest collisions with the Border Ruffians occurred in the spring and summer of 1856. In the autumn of that year the United States troops dispersed his band, and generally suppressed the civil war. In January, 1857, we find him in the Eastern States, appealing for arms and supplies to various committees and in various places, alleging that he desired to organize and equip a company of one hundred minutemen, who were "mixed up with the people of Kansas," but who should be ready on call to rush to the defense of freedom. This appeal only partly succeeded. From one committee he obtained authority as agent over certain arms stored in Iowa, the custody and control of which had been in dispute. From another committee he obtained a portion of the clothing he desired. From still other sources he received certain moneys, but not sufficient for his requirements. Two circumstances, however, indicate that he was practicing a deception upon the committees and public. He entered into a contract with a blacksmith, in Collinsville, Connecticut, to manufacture him

* On the night of May 24-25, 1856, five pro-slavery men living on Pottawatomie Creek, in Kansas, were mysteriously and brutally assassinated. The relatives and friends of the deceased charged John Brown and his band with these murders, which the relatives and friends of Brown persistently denied. His latest biographer, however, unreservedly admits his guilt: "For some reason he [John Brown] chose not to strike a blow himself; and this is what Salmon Brown meant when he declared that his father 'was not a participator in the deed.'" It was a very narrow interpretation of the word 'participator' which would permit such a denial; but it was no doubt honestly made, although for the purpose of disguising what John Brown's real agency in the matter was. He was, in fact, the originator and performer of these executions, although the hands that dealt the wounds were those of others."—F. B. Sanborn, "Life and Letters of John Brown," pp. 263-4.

† Redpath, "Life of John Brown," p. 48.

‡ Sanborn, in "Atlantic," April, 1872.

1000 pikes of a certain pattern,* to be completed in 90 days, and paid \$550 on the contract. There is no record that he mentioned this matter to any committee. His proposed Kansas minute-men were only to be one hundred in number, and the pikes could not be for them; his explanation to the blacksmith, that they would be a good weapon of defense for Kansas settlers, was clearly a subterfuge. These pikes, ordered about March 23d, 1857, were without doubt intended for his Virginia invasion; and in fact the identical lot, finished after long delay, under the same contract, were shipped to him in September, 1859, and were actually used in his Harper's Ferry attempt. The other circumstance is that, about the time of his contract for the pikes, he also, without the knowledge of committees or friends, engaged a worthless adventurer, named Forbes, to go West and give military instruction to his company,—a measure neither useful nor practicable for Kansas defense. These two acts may be taken as the first preparation for Harper's Ferry.

But merely to conceive great enterprises is not to perform them, and every after-step of John Brown reveals his lamentable weakness and utter inadequacy for the heroic rôle to which he fancied himself called. His first blunder was in divulging all his plans to Forbes, an utter stranger, while he was so careful in concealing them from others. Forbes, as ambitious and reckless as himself, of course soon quarreled with him, and left him, and endeavored first to supplant and then betray him.

Meanwhile, little by little, Brown gathered one colored and six white confederates from among his former followers in Kansas, and assembled them for drill and training in Iowa; † four others joined him there. ‡ These, together with his son Owen, counted, all told, a band of twelve persons engaged for, and partly informed of, his purpose. He left them there for instruction during the first three months of the year 1858, while he himself went East to procure means.

At the beginning of February, 1858, John Brown became, and remained for about a month, a guest at the house of Frederick

Douglass, in Rochester, New-York. Immediately on his arrival there he wrote to a prominent Boston abolitionist, T. W. Higginson:

"I now want to get, for the perfecting of by far the most important undertaking of my whole life, from \$500 to \$800 within the next sixty days. I have written Rev. Theodore Parker, George L. Stearns, and F. B. Sanborn, Esquires, on the subject." §

Correspondence and mutual requests for a conference ensued, and finally these Boston friends sent Sanborn to the house of Gerrit Smith, in Peterboro, New-York, where a meeting had been arranged. || Sanborn was a young man of twenty-six, just graduated from college, who, as secretary of various Massachusetts committees, had been the active agent for sending contributions to Kansas. He arrived on the evening of Washington's birthday, February 22d, 1858, and took part in a council of conspiracy, of which John Brown was the moving will and chief actor. ¶

Brown began by reading to the council a long document which he had drafted since his stay in Rochester.** It called itself a "Provisional Constitution and Ordinances for the People of the United States," which, as it explained, looked to no overthrow of States or dissolution of the Union, but simply to "amendment and repeal." It was not in any sense a reasonable project of government, but simply an ill-jointed outline of rules for a proposed slave insurrection. The scheme, so far as any comprehension of it may be gleaned from the various reports which remain, was something as follows:

Somewhere in the Virginia mountains he would raise the standard of revolt and liberation. Enthusiasts would join him from the free States, and escaped blacks come to his help from Canada. From Virginia and the contiguous and neighboring slave States of North Carolina, South Carolina, Georgia, Tennessee, and Kentucky, fugitive slaves, with their families, would flock to his camps. He would take his supplies, provisions, and horses by force from the neighboring plantations. Money, plate, watches, and jewelry would "constitute a liberal safety or intelligence fund." †† For arms, he had 200 Sharps rifles, and 200 revolvers, with which he would

* "He was exhibiting to a number of gentlemen, who happened to be collected together in a druggist's store, some weapons which he claimed to have taken from Captain Pate in Kansas. Among them was a two-edged dirk, with a blade about eight inches long, and he remarked that if he had a lot of those things to attach to poles about six feet long, they would be a capital weapon of defense for the settlers of Kansas. . . . When he came to make the contract, he wrote it to have malleable ferrules, cast solid, and a guard to be of malleable iron. . . . After seeing the sample he made a slight alteration. One was, to have a screw

put in, as the one here has, so that they could be unshipped in case of necessity."—Blair, Testimony before Investigating Committee, pp. 121-2.

† Realf Testimony, p. 91. Mason Report, 36th Cong. 1st Sess. Senate Reports, Vol. II.

†† Mason Report, Appendix, p. 55.

arm his best marksmen. His ruder followers, and even the women and children, he would arm with pikes to defend fortifications. He would construct defenses of palisades and earthworks. He would use natural strong-holds, and secret mountain passes to connect one with another; retreat from and evade attacks he could not overcome. He would maintain and indefinitely prolong a guerilla war, of which the Seminole Indians in Florida and the negroes in Hayti afforded examples. With success, he would enlarge the area of his occupation so as to include arable valleys and lowlands bordering the Alleghany range in the slave States; and here he would colonize, govern, and educate the blacks he had freed, and maintain their liberty. He would make captures and reprisals, confiscate property, take, hold, and exchange prisoners, and especially secure white hostages and exchange them for slaves to liberate. He would recognize neutrals, make treaties, exercise humanity, prevent crime, repress immorality, and observe all established laws of war. Success would render his revolt permanent, and in the end, through "amendment and repeal," abolish slavery. If, at the worst, he were driven from the mountains he would retreat with his followers through the free States to Canada. He had 12 recruits drilling in Iowa, and a half-executed contract for 1000 pikes in Connecticut;* furnish him \$800 in money and he would begin operations in May.

This, if we supply continuity and arrangement to his vagaries, must have been approximately what he felt or dreamily saw, and outlined in vigorous words to his auditors. His listening friends were dumfounded at the audacity as well as heart-sick at the hopelessness of such an attempt. They pointed out the almost certainty of failure and destruction, and attempted to dissuade him from the mad scheme; but to no purpose.† They saw they were dealing with a foregone conclusion; he had convoked them, not to advise as to methods, but to furnish the means. All reasonable argument he met with his rigid dogmatic formulas, his selected proverbs, his favorite texts of Scripture. The following, preserved by various witnesses as samples of his sayings at other times, indicate his reasoning on this occasion:

* Their Testimony, Mason Report, pp. 121-5.

†† "Meantime I had communicated his plans at his request to Theodore Parker, Wentworth Higginson, and Dr. Howe, and had given Mr. Stearns some gen-

"Give a slave a pike and you make him a man. I would not give Sharps rifles to more than ten men in a hundred, and then only when they have learned to use them. A ravine is better than a plan. Woods and mountain-sides can be held by resolute men against ten times their force. Nat Turner, with fifty men, held Virginia five weeks; the same number, well organized and armed, can shake the system out of the State." ‡ "A few men in the right, and knowing they are right, can overturn a king. Twenty men in the Alleghamies could break slavery to pieces in two years." "If God be for us who can be against us? Except the Lord keep the city, the watchman waketh but in vain." §

One of the participants relates, that — "When the agitated party broke up their council for the night, it was perfectly plain that Brown could not be held back from his purpose." || The discussion of the friends on the second day (February 23d) was therefore only whether they should aid him, or oppose him, or remain indifferent. Against every admonition of reason, mere personal sympathy seems to have carried a decision in favor of the first of these alternatives. "You see how it is," said the chief counsellor, Gerrit Smith; "our dear old friend has made up his mind to this course and cannot be turned from it. We cannot give him up to die alone; we must support him." ¶ Brown has left an exact statement of his own motive and expectation, in a letter to Sanborn on the following day.

"I have only had this one opportunity in a life of nearly sixty years. . . . God has honored but comparatively a very small part of mankind with any possible chance for such mighty and soul-satisfying rewards. . . . I expect nothing but to endure hardness, but I expect to effect a mighty conquest, even though it be like the last victory of Samson." ***

Nine days later Brown went to Boston, where the conspiracy was enlarged and strengthened by the promises and encouragements of a little coterie of radical abolitionists. †† Within the next two months the funds he desired were contributed and sent him. Meanwhile Brown returned West, and moved his company of recruits from Iowa, by way of Chicago and Detroit, to the town of Chatham, in Canada West, arriving there about the 1st of May. By written invitations, Brown here called together what is described as "a quiet convention of the friends of freedom," to perfect his organization. On the 8th of May, 1858, they held a meeting with closed doors, there being present the original company of ten or

eral conception of them. . . . No other person in New England except these four was informed by me of the affair, though there were many who knew or suspected Brown's general purposes. . . . Brown's first request, in 1858, was for a fund of \$1000 only; with this in hand he promised to take the field either in April or May. Mr. Stearns acted as treasurer of this fund, and before the first of May nearly the whole amount had been paid in or subscribed." — Sanborn, "Atlantic," April, 1875, pp. 456-7.

eleven white members and one colored, whom Brown had brought with him, and a somewhat miscellaneous gathering of negroes residents of Canada. Some sort of promise of secrecy was mutually made; then John Brown, in a speech, laid his plan before the meeting. One Delaney, a colored doctor, in a response, promised the assistance of all the colored people in Canada.* The provisional constitution drafted by Brown at Rochester was read and adopted by articles, and about forty-five persons signed their names to the "Constitution," for the "proscribed and oppressed races of the United States." Two days afterward, the meeting again convened for the election of officers, John Brown was elected Commander-in-chief by acclamation; other members were by the same summary method appointed Secretary of War, Secretary of State, Secretary of the Treasury, and two of them members of Congress. The election of a President was prudently postponed.

This Chatham convention cannot claim consideration as a serious deliberative proceeding. John Brown was its sole life and voice. The colored Canadians were nothing but spectators. The ten white recruits were mere Kansas adventurers, mostly boys in years and waifs in society, perhaps depending largely for livelihood on the employment or bounty, precarious as it was, of their leader. Upon this reckless, drifting material the strong despotic will, emotional enthusiasm, and mysterious rhapsodical talk of John Brown exercised an irresistible fascination; he drew them by easy gradations into his confidence and conspiracy. The remaining element, John Brown's son in the Chatham meeting, and other sons and relatives in the Harper's Ferry attack, are of course but the long educated instruments of the father's thought and purpose.

With funds provided, with his plan of government accepted, and himself formally appointed commander-in-chief, Brown doubtless thought his campaign about to begin; it was however destined to an unexpected interruption. The discarded and disappointed adventurer Forbes had informed several prominent Republicans in Washington City that Brown was meditating an unlawful enterprise; and the Boston committee, warned that certain arms in Brown's custody, which had been contributed for Kansas defense, were about to be flagrantly misused, dared not incur the public odium of complicity in such a deception and breach of faith. The Chatham organization was scarcely completed when Brown received word from the Boston committee

that he must not use the arms (the 200 Sharps rifles and 200 revolvers) which had been intrusted to him, for any other purpose than for the defense of Kansas.† Brown hurried to Boston; but oral consultation with his friends confirmed the necessity for postponement; and it was arranged that, to lull suspicion, he should return to Kansas and await a more favorable opportunity. He yielded assent, and that fall and winter performed the exploit of leading an armed foray into Missouri, and carrying away eleven slaves to Canada—an achievement which, while to a certain degree it placed him in the attitude of a public outlaw, nevertheless greatly increased his own and his followers' confidence in the success of his grand plan. Gradually the various obstacles melted away. Kansas became pacified. The adventurer Forbes faded out of sight and importance. The disputed Sharps rifles and revolvers were transferred from committee to committee, and finally turned over to a private individual to satisfy a debt. He in turn delivered them to Brown without any hampering conditions. The Connecticut blacksmith finished and shipped the thousand pikes. The contributions from the Boston committee swelled from one to several thousands of dollars. The recruits, with a few changes, though scattered in various parts of the country, were generally held to their organization and promise, and slightly increased in number. The provisional Constitution and sundry blank commissions were surreptitiously printed, and captains and lieutenants appointed by the signature of John Brown "Commander-in-chief," countersigned by the "Secretary of War."

Gradually, also, the Commander-in-chief resolved on an important modification of his plan; that, instead of plunging at once into the Virginia mountains, he would begin by the capture of the United States armory and arsenal at Harper's Ferry. Two advantages seem to have vaguely suggested themselves to his mind as likely to arise from this course: the possession of a large quantity of government arms, and the wide-spread panic and moral influence of so bold an attempt. But it nowhere appears that he had any conception of the increased risk and danger it involved, or that he adopted the slightest precaution to meet them.

Harper's Ferry was a town of five thousand inhabitants, lying between the slave States of Maryland and Virginia, at the confluence of the Potomac and the Shenandoah rivers, and where the united streams flow through a picturesque gap in the single mountain-range called the Blue Ridge. The situation possesses none of the elements which would make it a defensible fastness for protracted guerilla war-

* Realf Testimony, Mason Report, p. 99.

† Stearns to Brown, May 14th, 1858; Howe, Testimony, Mason Report, p. 177.

fire, such as was contemplated in Brown's plan. The mountains are everywhere approachable without difficulty; are pierced by roads and farms in all directions; contain few natural resources for sustenance, defense, or concealment; are easily observed or controlled from the plain by superior forces. The town is irregular, compact, and hilly; a bridge across each stream connects it with the opposite shores, and the Government factory and buildings, which utilized the water-power of the Potomac, lay in the lowest part of the point of land between the streams. The Baltimore and Ohio Railroad crosses the Potomac bridge.

On the 4th of July, 1859, John Brown, under an assumed name, with two sons and another follower, appeared near Harper's Ferry, and soon after rented the Kennedy Farm, in Maryland, five miles from the town, where he made a pretense of cattle-dealing and mining; but in reality collected secretly his rifles, revolvers, ammunition, pikes, blankets, tents, and miscellaneas articles for a campaign. His rather eccentric actions, and the irregular coming and going of occasional strangers at his cabin, created no suspicion in the neighborhood. Cautiously increasing his supplies, and gathering his recruits, he appointed the attack for the 24th of October; but for some unexplained reason (fear of treachery, it is vaguely suggested,) he precipitated his movement in advance of that date. From this point the occurrences exhibit no foresight or completeness of preparation, no diligent pursuit of an intelligent plan, nor skill to devise momentary expedients; only a blind impulse to act.

On Sunday evening, October 16th, 1859, Brown gave his final orders, humanely directing his men to take no life where they could avoid it. Placing a few pikes and other implements in his one-horse wagon, he started with his company of eighteen followers at eight o'clock in the evening, leaving five men behind. They cut the telegraph wires on the way, and reached Harper's Ferry about eleven o'clock. He himself broke open the armory gates, took the watchmen prisoners, and made that place his headquarters. Separating his men into small detachments, he took possession of, and attempted to hold, the two bridges, the arsenal, and the rifle-factory. Next he sent six of his men five miles into the country to bring in several prominent slave-owners and their slaves. This was accomplished before daylight, and all were brought as prisoners to Brown at the armory. With them they also brought a large four-horse farm wagon, which he now sent to transfer arms from his Kennedy farm to a school-house on the Maryland side of the Potomac, about one mile from the town.

Meanwhile, about midnight of Sunday, they detained the railroad train three hours, but finally allowed it to proceed. A negro porter was shot on the bridge. The town began to be alarmed. Citizens were captured at various points, and brought to swell the number of prisoners at the armory, counting forty or fifty by morning. Still, not until daylight, and even until the usual hour of rising on Monday morning, did the town comprehend the nature and extent of the trouble.

What, now, did Brown intend to do? What result did he look for from his movement thus far? Amid his conflicting acts and contradictory explanations, the indications seem clear only on two or three points. Both he and his men gave everybody to understand without reserve that they had come not to kill or destroy, but only to liberate the slaves. Soon, also, he placed pikes in the hands of his black prisoners. But that ceremony did not make soldiers of them, as his favorite maxim taught. They held them in their hands with listless indifference, remaining themselves, as before, an incumbrance instead of a reinforcement. He gave his white prisoners notice that he would hold them as hostages, and informed one or two that, after daylight, he would exchange them for slaves. Before the general fighting began, he endeavored to effect an armistice or compromise with the citizens, to stop blood-shed, on condition that he be permitted to hold the armory and retain the liberated negroes. All this warrants the inference that he expected to hold the town, first, by the effect of terror; secondly, by the display of leniency and kindness; and supposed that he could remain indefinitely, and dictate terms at his leisure. The fallacy of this scheme became quickly apparent.

As the day dawned upon the town and the truth upon the citizens, his situation in a military point of view was already hopeless,—eighteen men against perhaps 1000 adults, and these eighteen scattered in four or five different squads, without means of mutual support, communication, or even contingent orders! Gradually, as the startled citizens became certain of the insignificant numbers of the assailants, an irregular street-firing broke out between Brown's sentinels and individuals with firearms. The alarm was carried to neighboring towns, and killed and wounded on both sides augmented the excitement. Tradition rather than definite record asserts that some of Brown's lieutenants began to comprehend that they were in a trap, and advised him to retreat. Nearly all his eulogists have assumed that such was his original plan, and his own subsequent excuses hint at this intention. But the claim is clearly untenable. He had no means of defensive retreat,—

no provisions, no transportation for his arms and equipage, no supply of ammunition. The suggestion is an evident afterthought.

Whether from choice or necessity, however, he remained only to find himself more and more closely pressed. By Monday noon the squad in the rifle-works, distant one mile from the armory, had been driven out, killed, and captured. The other squads, not so far from their leader, joined him at the armory, minus their losses. Already he was driven to take refuge with his diminished force in the engine-house, a low, strong brick building in the armory yard, where they barricaded the doors and improvised loop-holes, and into which they took with them ten selected prisoners as hostages. But the expedient was one of desperation. By this movement Brown literally shut himself up in his own prison, from which escape was impossible.

A desultory fire was kept up through doors and loop-holes. But now the whole country had become thoroughly aroused, and sundry military companies from neighboring towns and counties poured into Harper's Ferry. Brown himself at length realized the hopelessness of his position, and parleyed for leave to retreat across the river on condition of his giving up his prisoners; but it was too late. President Buchanan also took prompt measures; and on Monday night a detachment of eighty marines from the Washington navy-yard, under command of Colonel Robert E. Lee, of the United States army, the same who afterward became the principal leader of the Confederate armies in the Rebellion, reached the scene of action, and were stationed in the armory yard so as to cut off the insurgents from all retreat. At daylight on Tuesday morning Brown was summoned to surrender at discretion, but he refused. The instant the officer left the engine-house a storming-party of marines battered in the doors; in five minutes the conflict was over. One marine was shot dead in the assault; Brown fell under severe sword and bayonet wounds, two of his son's lay dead or dying, and four or five of his men were made prisoners, only two remaining unhurt. The great scheme of liberation built up through nearly three years of elaborate conspiracy, and designed to be executed in defiance of law, by individual enterprise with pikes, rifles, forts, guerilla war, prisoners, hostages, and plunder, was, after an experimental campaign of thirty-six hours, in utter collapse. Of Brown's total force of twenty-two men, ten were killed, five escaped, and seven were captured, tried, and hanged. Of the townspeople, five had been killed and eight wounded.

While John Brown's ability for military leadership is too insignificant even for ridicule,

his moral and personal courage compelled the admiration of his enemies. Arraigned before a Virginia court, the authorities hurried through his trial for treason, conspiracy, and murder, with an unseemly precipitancy, almost calculated to make him seem the accuser, and the commonwealth the trembling culprit. He acknowledged his acts with frankness, defended his purpose with a sincerity that betokened honest conviction, bore his wounds and met his fate with a manly fortitude. Eight years before, he had written, in a document organizing a band of colored people in Springfield, Massachusetts, to resist the fugitive slave law: "Nothing so charms the American people as personal bravery. The trial for life of one bold, and to some extent successful, man, for defending his rights in good earnest, would arouse more sympathy throughout the nation than the accumulated wrongs and sufferings of more than three millions of our submissive colored population." Even now, when mere Quixotic knight-errantry and his own positive violation of the rights of individuals and society had put his life in forfeit, this sympathy for his boldness and misfortune came to him in large measure. Questioned by Governor Wise, Senator Mason, and Representative Vallandigham about his accomplices, he refused to say anything except about what he had done, and freely took upon himself the whole responsibility. He was so warped by his religious training as to have become a fatalist as well as a fanatic. "All our actions," he said to one who visited him in prison, "even all the follies that led to this disaster, were decreed to happen ages before the world was made."* The gloomy philosophy of Calvin is the key which unlocks the mysteries of Brown's life and deeds.

He was convicted, sentenced, and hanged on the 2d of December. Congress met a few days afterward, and the Senate appointed an investigating committee to inquire into the seizure of the United States armory and arsenal. The long and searching examination of many witnesses brought out with sufficient distinctness the varied personal plottings of Brown, but failed to reveal that half a dozen radical abolition clergymen of Boston were party to the conspiracy; nor did they then or afterward justify their own conduct by showing that Christ ever counseled treason, abetted conspiracy, or led rebellion against established government. From beginning to end, the whole act was reprehensible, and fraught with evil result. Modern civilization and republican government require that beyond the self-defense necessary to the protection of life and limb, all coercive reform shall act by authority of law only.

* Sanborn in "Atlantic," Dec., 1875, p. 718.

Upon politics the main effect of the Harper's Ferry incident was to aggravate the temper and increase the bitterness of all parties. Jefferson Davis, of Mississippi; Mason, of Virginia; and Fish, of Indiana, democratic members of the Senate investigating committee, sought diligently but unsuccessfully to find grounds to hold the Republican party at large responsible for Brown's raid. They felt obliged to report that they could not recommend any legislation to meet similar cases in the future, since the "invasion" of Virginia was not of the kind mentioned in the Constitution, but was "simply the act of lawless ruffians, under the sanction of no public or political authority." * Collamer, of Vermont, and Doolittle, of Wisconsin, Republican members of the committee, in their minority report, considered the affair an outgrowth of the pro-slavery lawlessness in Kansas. Senator Douglas, of Illinois, however, apparently with the object of still further setting himself right with the South, and atoning for his Freeport heresy, made a long speech in advocacy of a law to punish conspiracies in one State or Territory against the government, people, or property of another; once more quoting Lincoln's Springfield speech, and Seward's Rochester speech as containing revolutionary doctrines.

In the country at large, as in Congress, the John Brown raid excited bitter discussion and radically diverse comment,—some execrating him as a deserved felon, while others exalted him as a saint. His Boston friends particularly, who had encouraged him with either voice or money, were extravagant in their demonstrations of approval and admiration. On the day of his execution religious services were held, and funeral bells were tolled. "Some eighteen hundred years ago," said Thoreau, "Christ was crucified; this morning, perchance, Captain Brown was hung. These are the two ends of a chain which is not without its links." † "The road to heaven," said Theodore Parker, "is as short from the gallows as from a throne; perhaps, also, as easy." Emerson, using a yet stronger figure, had already called him "a new saint, waiting yet his martyrdom, and who, if he shall suffer, will make the gallows glorious like the cross." ‡

Amid this conflict of argument, public opinion in the free States gravitated to neither extreme. It accepted neither the declaration of the great orator Wendell Phillips, that "the lesson of the hour is insurrection," § nor the assertion of the great lawyer Charles

O'Connor, that slavery "is in its own nature, as an institution, beneficial to both races." ||

This chapter would be incomplete if we neglected to quote Mr. Lincoln's opinion of the Harper's Ferry attempt. His quiet and common-sense criticism of the affair, pronounced a few months after its occurrence, was substantially the conclusion to which the average public judgment has come after the lapse of a quarter of a century:

"Slave insurrections are no more common now than they were before the Republican party was organized. What induced the Southampton insurrection, twenty-eight years ago, in which at least three times as many lives were lost as at Harper's Ferry? You can scarcely stretch your very elastic fancy to the conclusion that Southampton was 'got up by Black Republicanism.' In the present state of things in the United States, I do not think a general or even a very extensive slave insurrection is possible. The indispensable concert of action cannot be attained. The slaves have no means of rapid communication; nor can incendiary freemen, black or white, supply it. The explosive materials are everywhere in parcels; but there neither are nor can be supplied the indispensable connecting trains.

"Much is said by Southern people about the affection of slaves for their masters and mistresses; and a part of it, at least, is true. A plot for an uprising could scarcely be devised and communicated to twenty individuals before some one of them, to save the life of a favorite master or mistress, would divulge it. This is the rule; and the slave revolution in Hayti was not an exception to it, but a case occurring under peculiar circumstances. The gunpowder plot of British history, though not connected with slaves, was more in point. In that case, only about twenty were admitted to the secret; and yet one of them, in his anxiety to save a friend, betrayed the plot to that friend, and, by consequence, averted the calamity. Occasional poisonings from the kitchen, and open or stealthy assassinations in the field, and local revolts extending to a score or so, will continue to occur as the natural results of slavery; but no general insurrection of slaves, as I think, can happen in this country for a long time. Whoever much fears or much hopes for such an event, will be alike disappointed. . . .

"John Brown's effort was peculiar. It was not a slave insurrection. It was an attempt by white men to get up a revolt among slaves, in which the slaves refused to participate. In fact, it was so absurd that the slaves, with all their ignorance, saw plainly enough it could not succeed. That affair, in its philosophy, corresponds with the many attempts related in history, at the assassination of kings and emperors. An enthusiast broods over the oppression of a people till he fancies himself commissioned by Heaven to liberate them. He ventures the attempt, which ends in little else than his own execution. Orsini's attempt on Louis Napoleon, and John Brown's attempt at Harper's Ferry were, in their philosophy, precisely the same. The eagerness to cast blame on old England in the one case, and on New England in the other, does not disprove the sameness of the two things." ¶

The aggravation of partisan temper over the Harper's Ferry incident found a manifestation

¶ Lincoln, Cooper Institute speech, Feb. 27th, 1860.

in a contest over the Speakership in the House of Representatives as prolonged and bitter as that which attended the election of Banks. In the Congressional elections of 1858, following the Lecompton controversy, the Democrats had once more lost control of the House of Representatives; there having been chosen 113 Republicans, 93 Administration Democrats, 8 anti-Lecompton Democrats, and 23 South Americans, as they were called; that is, members, mainly from the slave States, opposed to the Administration.*

This XXXVIth Congress began its session three days after the execution of John Brown, and the election of a Speaker was the first work of the new House of Representatives. The Republicans, not having a majority, made no caucus nomination; but John Sherman, of Ohio, had the largest following on the first ballot, and thereafter received their united efforts to elect him. At this point a Missouri member introduced a resolution declaring:

"That the doctrines and sentiments of a certain book called 'The Impending Crisis of the South — How to Meet it,' purporting to have been written by one Hinton R. Helper [of North Carolina], are insurrectionary and hostile to the domestic peace and tranquillity of the country, and that no member of this House who has indorsed and recommended it, or the compend from it, is fit to be Speaker of this House."†

This resolution was aimed at Sherman, who with some seventy Republicans of the previous Congress had signed a circular indorsing and recommending the book upon the general statement that it was an antislavery work, written by a Southerner. The book addressed itself to non-slaveholding Southern whites, and was mainly made up of statistics, but contained occasional passages of intolerant and vindictive sentiment against slaveholders. Whether it could be considered "insurrectionary" depended altogether on the pro-slavery or antislavery bias of the critic. Besides, the author had agreed that the obnoxious passages should not be printed in the compendium which the Republicans recommended in their circular. When interrogated, Mr. Sherman replied that he had never seen the book, and that "I am opposed to any interference whatever by the people of the free States with the relations of master and slave in the slave States." But the disavowal did not relieve him from Southern enmity. The fire-eaters seized the pretext to charge him with all manner of "abolition" intentions, and by violent debate and the utterance of threats of disunion, made the House a parliamentary and almost a revolu-

tionary babel for nearly two months. Certain appropriations were exhausted, and the treasury was in sore need of funds. Efforts were made to adopt the plurality rule, and to choose a Speaker for a limited period; but every such movement was resisted for the purpose of defeating Sherman, or rather, through his defeat to force the North into unconditional submission to extreme pro-slavery sentiment. The struggle, nominally over an incident, was in reality over a policy.

On January 30th, 1860, Mr. Sherman withdrew his name, and the solid Republican vote was given to William Pennington of New Jersey, another Republican, who, on February 1st, was elected Speaker by 117 votes, 4 opposing members having come to his support. The South gained nothing by the obstructionist policy of its members. During the long contest, extending through forty-four ballots, their votes were scattered among many candidates of different factions, while the Republicans maintained an almost unbroken steadiness of party discipline. On the whole, the principal results of the struggle were to sectionalize parties, more completely ripen Southern sentiment toward secession, and combine wavering voters in the free States in support of Republican doctrines.

LINCOLN'S COOPER INSTITUTE SPEECH.

AMONG the many invitations to deliver addresses which Lincoln received in the fall of 1859, was one from a committee asking him to lecture in Plymouth Church, Brooklyn, in a course then in progress there, designed for popular entertainment. "I wrote," said Lincoln, "that I could do it in February, provided they would take a political speech, if I could find time to get up no other."‡ "Your letter was duly received and handed over to the committee," was the response, "and they accept your compromise. You may lecture at the time you mention, and they will pay you \$200. I think they will arrange for a lecture in New York also, and pay you \$200 for that."§

Financial obstacles, or other reasons, brought about the transfer of the engagement to a new committee,|| and the invitation was repeated in a new form:

"The Young Men's Central Republican Union of this city (New York) very earnestly desire that you should deliver what I may term a political lecture during the ensuing month. The peculiarities of the case are these: A series of lectures has been determined upon. The first was delivered by Mr. Blair, of St. Louis, a

‡ Lincoln to McNeill, April 6th, 1860. Lamon, "Life of Abraham Lincoln," p. 441.

§ Jas. A. Briggs to Lincoln, November 1st, 1859. MS.

|| Jas. A. Briggs in New York "Evening Post," August 16th, 1867.

short time ago; the second will be in a few days, by Mr. Cassius M. Clay, and the third we would prefer to have from you rather than any other person. Of the audience I should add that it is not [that] of an ordinary political meeting. These lectures have been arranged to call out our better, but busier, citizens who never attend political meetings. A large part of the audience will also consist of ladies."*

Lincoln, however, remained under the impression that the lecture was to be given in Brooklyn, and only learned after he reached New York to fulfill his engagement that he was to speak in the Cooper Institute.† When, on the evening of February 27th, 1860, he stood before his audience, he saw not only a well-filled house, but an assemblage of listeners in which were many whom, by reason of his own modest estimate of himself, he would have been rather inclined to ask advice from than to offer instruction to. William Cullen Bryant presided over the meeting; David Dudley Field escorted the speaker to the platform; ex-Governor King, Horace Greeley, James W. Nye, Cephas Brainerd, Charles C. Nott, Hiram Barney, and others sat among the invited guests. "Since the days of Clay and Webster," said the "Tribune" next morning, "no man has spoken to a larger assemblage of the intellect and mental culture of our city." Of course the presence of such a gathering was no mere accident. Not only had Lincoln's name for nearly two years found constant mention in the newspapers, but both friendly and hostile comment had coupled it with the two ranking political leaders in the free States — Seward and Douglas. The representative men of New York were naturally eager to see and hear one who, by whatever force of eloquence or argument, had attracted so large a share of the public attention. We may also fairly infer that, on his part, Lincoln was no less curious to test the effect of his words on an audience more learned and critical than those collected in the open-air meetings of his Western campaigns. This mutual interest was an evident advantage to both; it secured a close attention from the house, and insured deliberation and emphasis by the speaker, enabling him to develop his argument with perfect precision and unity, reaching perhaps the happiest general effect ever attained in any one of his long addresses.

He took as his text a phrase uttered by Senator Douglas in the late Ohio campaign, — "Our fathers, when they framed the government under which we live, understood this question just as well, and even better than we do now." Lincoln defined "this question," with a lawyer's exactness, thus:

"Does the proper division of local from Federal authority, or anything in the Constitution, forbid our Federal Government to control as to slavery in our Federal Territories? Upon this Senator Douglas holds the affirmative, and the Republicans the negative. This affirmation and denial form an issue, and this issue — this question — is precisely what the text declares our fathers understood 'better than we.'"

From this "precise and agreed starting-point" Lincoln next traced with minute historical analysis the action of "our fathers" in framing "the government under which we live," by their votes and declarations in the Congresses which preceded the Constitution, and in the Congresses following which proposed its twelve amendments and enacted various Territorial prohibitions. His conclusions were irresistibly convincing.

"The sum of the whole is," said he, "that of our thirty-nine fathers who framed the original Constitution, twenty-one — a clear majority of the whole — certainly understood that no proper division of local from Federal authority, nor any part of the Constitution, forbade the Federal Government to control as to slavery in the Federal Territories; while all the rest probably had the same understanding. Such unquestionably was the understanding of our fathers who framed the original Constitution; and the text affirms that they understood the question 'better than we.' . . . It is surely safe to assume that the thirty-nine framers of the original Constitution and the seventy-six members of the Congress which framed the amendments thereto, taken together, do certainly include those who may be fairly called 'our fathers who framed the government under which we live.' And so assuming, I defy any man to show that any one of them ever, in his whole life, declared that in his understanding any proper division of local from Federal authority, or any part of the Constitution, forbade the Federal government to control as to slavery in the Federal Territories. I go a step further. I defy any one to show that any living man in the whole world ever did, prior to the beginning of the present century (and I might almost say prior to the beginning of the last half of the present century), declare that in his understanding any proper division of local from Federal authority, or any part of the Constitution, forbade the Federal Government to control as to slavery in the Federal Territories. To those who now so declare, I give, not only 'our fathers who framed the government under which we live,' but with them all other living men within the century in which it was framed, among whom to search, and they shall not be able to find the evidence of a single man agreeing with them."

"Now, and here, let me guard a little against being misunderstood. I do not mean to say we are bound to follow implicitly in whatever our fathers did. To do so would be to discard all the lights of current experience — to reject all progress, all improvement. What I do say is, that if we would supplant the opinions and policy of our fathers in any case, we should do so upon evidence so conclusive, and argument so clear, that even their great authority, fairly considered and weighed, cannot stand; and most surely not in a case, whereof we ourselves declare they understood the question better than we."

If any part of the audience came with the expectation of hearing the rhetorical fireworks of a Western stump-speaker of the "half-horse, half-alligator" variety, they met novelty of an unlooked for kind. In Lincoln's entire address

* C. C. Nott to Lincoln, February 9th, 1860. MS.

† Lincoln to McNeill, April 6th, 1860. Lamon, "Life of Abraham Lincoln," p. 441.

he neither introduced an anecdote nor essayed a witticism; and the first half of it does not contain even an illustrative figure or a poetical fancy. It was the quiet, searching exposition of the historian, and the terse, compact reasoning of the statesman, about an abstract principle of legislation, in language well-nigh as restrained and colorless as he would have employed in arguing a case before a court. Yet such was the apt choice of words, the easy precision of sentences, the simple strength of propositions, the fairness of every point he assumed, and the force of every conclusion he drew, that his listeners followed him with the interest and delight a child feels in its easy mastery of a plain sum in arithmetic.

With the sympathy and confidence of his audience thus enlisted, Lincoln next took up the more prominent topics in popular thought, and by words of kindly admonition and protest addressed to the people of the South, showed how impatiently, unreasonably, and unjustly they were charging the Republican party with sectionalism, with radicalism, with revolutionary purpose, with the John Brown raid, and kindred political offenses, not only in the absence of any acts to justify such charges, but even in the face of its emphatic and constant denials and disavowals. The illustration with which he concluded this branch of his theme could not well be surpassed in argumentative force.

"But you will not abide the election of a Republican President! In that supposed event, you say, you will destroy the Union; and then you say, the great crime of having destroyed it will be upon us! That is cool. A highwayman holds a pistol to my ear, and mutters through his teeth, 'Stand and deliver, or I shall kill you, and then you will be a murderer!' To be sure what the robber demanded of me — my money — was my own; and I had a clear right to keep it; but it was no more my own than my vote is my own; and the threat of death to me to extort my money, and the threat of destruction to the Union to extort my vote, can scarcely be distinguished in principle."

But the most impressive, as well as the most valuable, feature of Lincoln's address was its concluding portion, where, in advice directed, especially to Republicans, he pointed out in dispassionate but earnest language that the real, underlying conflict was in the difference of moral conviction between the sections as to the inherent right or wrong of slavery, and in view of which he defined the proper duty of the free States.

"A few words now," said he, "to Republicans. It is exceedingly desirable that all parts of this great Confederacy shall be at peace and in harmony one with another. Let us Republicans do our part to have it so. Even though much provoked, let us do nothing through passion and ill temper. Even though the Southern people will not so much as listen to us, let us calmly consider their demands, and yield to them if, in our deliberate view of our duty, we possibly can. Judging

by all they say and do, and by the subject and nature of their controversy with us, let us determine, if we can, what will satisfy them.

"Will they be satisfied if the Territories be unconditionally surrendered to them? We know they will not. In all their present complaints against us the Territories are scarcely mentioned. Invasions and insurrections are the rage now. Will it satisfy them if, in the future, we have nothing to do with invasions and insurrections? We know it will not. We so know, because we know we never had anything to do with invasions and insurrections; and yet this total abstaining does not exempt us from the charge and the denunciation.

"The question recurs, What will satisfy them? Simply this: We must not only let them alone, but we must, somehow, convince them that we do let them alone. This, we know by experience, is no easy task. We have been so trying to convince them from the very beginning of our organization, but with no success. In all our platforms and speeches we have constantly protested our purpose to let them alone; but this has had no tendency to convince them. Alike unavailing to convince them is the fact that they have never detected a man of us in any attempt to disturb them.

"These natural and apparently adequate means all failing, what will convince them? This, and this only: cease to call slavery wrong, and join them in calling it right. And this must be done thoroughly — done in acts as well as in words. Silence will not be tolerated; we must place ourselves avowedly with them. Senator Douglas's new sedition law must be enacted and enforced, suppressing all declarations that slavery is wrong, whether made in politics, in presses, in pulpits, or in private. We must arrest and return their fugitive slaves with greedy pleasure. We must pull down our free-State constitutions. The whole atmosphere must be disinfected from all taint of opposition to slavery before they will cease to believe that all their troubles proceed from us.

"I am quite aware they do not state their case precisely in this way. Most of them would probably say to us, 'Let us alone, do nothing to us, and say what you please about slavery.' But we do let them alone — have never disturbed them; so that, after all, it is what we say which dissatisfies them. They will continue to accuse us of doing until we cease saying.

"I am also aware they have not, as yet, in terms, demanded the overthrow of our free-State constitutions. Yet those constitutions declare the wrong of slavery, with more solemn emphasis than do all other sayings against it, and when all these other sayings shall have been silenced, the overthrow of these constitutions will be demanded and nothing be left to resist the demand. It is nothing to the contrary that they do not demand the whole of this just now. Demanding what they do, and for the reason they do, they can voluntarily stop nowhere short of this consummation. Holding, as they do, that slavery is morally right, and socially elevating, they cannot cease to demand a full national recognition of it, as a legal right and a social blessing.

"Nor can we justifiably withhold this on any ground, save our conviction that slavery is wrong. If slavery is right, all words, acts, laws, and constitutions against it are themselves wrong, and should be silenced and swept away. If it is right, we cannot justly object to its nationality — its universality! if it is wrong, they cannot justly insist upon its extension — its enlargement. All they ask we could readily grant, if we thought slavery right; all we ask they could as readily grant, if they thought it wrong. Their thinking it right, and our thinking it wrong, is the precise fact upon which depends the whole controversy. Thinking it right, as they do, they are not to blame for desiring its full recognition, as being right; but thinking it wrong as we do, can we yield to them? Can we cast our votes with their view and against our own? In view of our moral, social, and political responsibilities, can we do this?

"Wrong as we think slavery is, we can yet afford to let it alone where it is, because that much is due to the necessity arising from its actual presence in the nation; but we will, while our votes will prevent it, allow it to spread into the national Territories, and to overrun us here in the free States." If our sense of duty forbids this, then let us stand by our duty, fearlessly and eternally. Let us be warned by none of those sophistical contrivances wherewith we are so industriously plied and belabored, contrivances such as groping for some middle ground between the right and the wrong, just as the search for a man who should be neither a living man nor a dead man, such as a policy of 'don't care' on a question about which all true men do care, such as Union appeals beseeching true Union men to yield to Disunionists; reversing the divine rule, and calling not the sinners, but the righteous to repentance; such as resolutions to Washington, imploring men to obey what Washington said, and imitating what Washington did.

"Neither let us be slandered from our duty by false accusations against us, nor frightened from it by menaces of destruction to the Government nor of dungeons to ourselves. Let us have faith that right makes might, and in that faith, let us, to the end, dare to do our duty as we understand it."

The smiles, the laughter, the outbursts of applause which greeted and emphasized the speaker's telling points, showed Mr. Lincoln that his arguments met ready acceptance. The next morning the four leading New York dailies printed the speech in full, and bore warm testimony to its merit and effect.

"Mr. Lincoln is one of nature's orators," said the *Freeman*. "using his rare powers solely to elucidate and convince, though their inevitable effect is to delight and electrify as well. We present herewith a very full and accurate report of this speech; yet the tones, the gestures, the kindling eye, and the mirth-provoking look defy the reporter's skill. The vast assemblage frequently rang with cheers and shouts of applause, which were prolonged and intensified at the close. No man ever before made such an impression on his first appeal to a New York audience."

A pamphlet reprint was at once announced by the same paper; and later, in the Presidential campaign, a more careful edition was prepared and circulated, to which were added copious notes by two members of the committee under whose auspices the address was delivered. Their comment, printed in the preface, is worth quoting as showing its literary value under critical analysis.

"No one who has not actually attempted to verify its details can understand the patient research and historical labor which it embodies. The history of our earlier politics is scattered through numerous journals, *ettes*, pamphlets, and letters; and these are defective in completeness and accuracy of statement, and in indices and tables of contents. Neither can any one who has not traveled over this precise ground appreciate the accuracy of every trivial detail, or the self-denying impartiality with which Mr. Lincoln has turned from the testimony of 'the fathers' on the general question of slavery, to present the single question which he discusses. From the first line to the last, from his prem-

ises to his conclusion, he travels with a swift, unerring directness which no logician ever excelled, an argument complete and full, without the affectation of learning, and without the stiffness which usually accompanies dates and details. A single, easy, simple sentence of plain Anglo-Saxon words contains a chapter of history that, in some instances, has taken days of labor to verify, and which must have cost the author months of investigation to acquire."†

From New York Lincoln went to fill other engagements to speak at several places in New England, where he met the same enthusiastic popular reception and left the same marked impression, especially upon the more critical and learned hearers. They found no little surprise in the fact that a Western politician, springing from the class of unlettered frontiersmen, could not only mold plain strong words into fresh and attractive phraseology, but maintain a clear, sustained, convincing argument, equal in force and style to the best examples in their college text-books. More interesting, however, than the experiences of those who listened to him are the comments of Lincoln himself on the methods by which he acquired his powers as an orator. A clergyman who was among his auditors on one of these occasions has recorded the following as among his statements in a conversation he held with him in a railroad car:

"'Ah! that reminds me,' he said 'of a most extraordinary circumstance, which occurred in New Haven, the other day. They told me that the professor of rhetoric in Yale College—a very learned man, isn't he?' 'Yes, sir, and a very fine critic too.' 'Well, I suppose so; he ought to be at any rate—they told me that he came to hear me, and took notes of my speech, and gave a lecture on it to his class the next day; and, not satisfied with that, he followed me up to Meriden the next evening, and heard me again for the same purpose. Now, if this is so, it is to my mind very extraordinary. I have been sufficiently astonished at my success in the West. It has been most unexpected. But I had no thought of any marked success at the East, and least of all that I should draw out such commendations from literary and learned men!' . . .

"'That suggests, Mr. Lincoln, an inquiry which has several times been upon my lips during this conversation. I want very much to know how you got this unusual power of "putting things." It must have been a matter of education. No man has it by nature alone. What has your education been?'

"'Well, as to education, the newspapers are correct—I never went to school more than six months in my life. But, as you say, this must be a product of culture in some form. I have been putting the question you ask me to myself while you have been talking. I say this, that among my earliest recollections, I remember how, when a mere child, I used to get irritated when anybody talked to me in a way I could not understand. I don't think I ever got angry at anything else in my life. But that always disturbed my temper, and has ever since. I can remember going to my little bedroom, after hearing the neighbors talk of an evening with my father, and spending no small part of the night walking up and down, and trying to make out what was the exact meaning of some of their, to me, dark sayings. I could not sleep, though I often tried to, when I got on such a hunt after an idea, until I had caught it; and when I thought I had got it, I was not satisfied until

* "New York Tribune," February 28th, 1860.

† Pamphlet edition with notes and preface by Charles C. Nott and Cephas Brainerd, September, 1860.

I had repeated it over and over, until I had put it in language plain enough, as I thought, for any boy I knew to comprehend. This was a kind of passion with me, and it has stuck by me, for I am never easy now, when I am handling a thought, till I have bounded it north and bounded it south and bounded it east and bounded it west. Perhaps that accounts for the characteristic you observe in my speeches, though I never put the two things together before.'

"Mr. Lincoln, I thank you for this. It is the most splendid educational fact I ever happened upon. This is genius, with all its impulsive, inspiring, dominating power over the mind of its possessor, developed by education into talent, with its uniformity, its permanence, and its disciplined strength, always ready, always available, never capricious — the highest possession of the human intellect. But, let me ask, did you not have a law education? How did you prepare for your profession?'

"Oh, yes! I "read law," as the phrase is; that is, I became a lawyer's clerk in Springfield, and copied tedious documents, and picked up what I could of law in the intervals of other work. But your question reminds me of a bit of education I had, which I am bound in honesty to mention. In the course of my law-reading I constantly came upon the word demonstrate. I thought at first that I understood its meaning, but soon became satisfied that I did not. I said to myself, "What do I do when I demonstrate more than when I reason or prove? How does demonstration differ from any other proof?" I consulted Webster's Dictionary. That told of "certain proof" "proof beyond the possibility of doubt;" but I could form no idea of what sort of proof that was. I thought a great many things were proved beyond a possibility of doubt, without recourse to any such extraordinary process of reasoning as I understood "demonstration" to be. I consulted all the dictionaries and books of reference I could find, but with no better results. You might as well have defined blue to a blind man. At last I said, "Lincoln, you can never make a lawyer if you do not understand what demonstrate means;" and I left my situation in Springfield, went home to my father's house, and staid there till I could give any proposition in the six books of Euclid at sight. I then found out what "demonstrate" means, and went back to my law studies.'

"I could not refrain from saying, in my admiration at such a development of character and genius combined, 'Mr. Lincoln, your success is no longer a marvel. It is the legitimate result of adequate causes.'"

It must be borne in mind that the report of the foregoing conversation was not written until more than four years after it took place. While the main facts and ideas are doubtless given with reasonable fidelity, anything like verbal accuracy in recording Mr. Lincoln's phraseology is not to be presumed. Those acquainted with his style can see that the language is clearly that of his interviewer, though the latter has evidently reproduced the main current of the conversation. We have in Mr. Lincoln's own handwriting the affirmance of one of the facts mentioned and discussed. In a brief sketch of his early life which he wrote after his first nomination, to serve as memoranda for a campaign biographer, stands this modest sentence; he speaking of himself in the third person: "He studied and nearly

mastered the six books of Euclid since he was a member of Congress." In the frank explanation made in the interview quoted from, we are let more into the motives and details of this and other of his educational experiences, and, despite the verbal defects of the report, we discern the strong qualities and diligent methods by aid of which he attained such rare excellence in argument and oratory.

THE CHARLESTON CONVENTION.

THE great political struggle between the North and the South, between Freedom and Slavery, was approaching its culmination. The "irrepressible conflict" had shifted uneasily from caucus to Congress; from Congress to Kansas; incidentally to the Supreme Court and to the Congressional elections in the various States; from Kansas it had come back with renewed intensity to Congress. The next stage of development through which it was destined to pass was the Presidential election of 1860, where, necessarily, the final result would depend largely upon the attitude and relation of parties, platforms, and candidates as selected and proclaimed by their National conventions.

The first of these National conventions was that of the Democratic party, long appointed to meet at Charleston, South Carolina, on April 23d, 1860. The fortunes of the party had greatly fluctuated. The repeal of the Missouri Compromise had brought it shipwreck in 1854; it had regained victory in the election of Buchanan, and a majority of the House of Representatives in 1856; then the Lecompton imbroglio once more caused its defeat in the Congressional elections of 1858. But worse than the victory of its opponents was the irreconcilable schism in its own ranks — the open war between President Buchanan and Senator Douglas. In a general way the Southern democracy followed Buchanan, while the Northern democracy followed Douglas. Yet there was just enough local exception to baffle accurate calculation. Could the Charleston Convention heal the feud of leaders, and bridge the chasm in policy and principle? As the time approached, and delegation after delegation was chosen by the States, all hope of accommodation gradually disappeared. Each faction put forth its utmost efforts, rallied its strongest men. Each caucus and convention only accentuated and deepened existing differences. When the convention met, its members brought not the ordinary tricks and expedients of politicians with *carte blanche* authority, but the precise formulated terms to which their constituencies would consent. They were only messengers, not arbitrators. The Charleston

* The Rev. J. P. Gulliver in N. Y. "Independent," Sept. 1st, 1864.

Convention was the very opposite of its immediate predecessor, the Cincinnati Convention. At Cincinnati, concealment and ambiguity had been the central thought and purpose. Everybody was anxious to be hoodwinked. Delegates, constituencies, and leaders had willingly joined in the game of "cheat and be cheated." Availability, harmony, party success, were the paramount objects.

No similar ambiguity, concealment, or bargain was possible at Charleston. There was indeed a whole brood of collateral issues to be left in convenient obscurity, but the central questions must not be slurred. The Lecompton quarrel, the Freeport doctrine, the property theory, the "slave-State" dogma, the Congressional slave code proposal, must be boldly met and squarely adjusted. Even if the delegates had been disposed to trifle with their constituents, the leaders themselves would tolerate no evasion on certain cardinal points. Douglas, in his Dorr letter, had announced that he would suffer no interpolation of new issues into the Democratic creed. In his pamphlet reply to Judge Black he repeated his determination with emphasis.

"Suppose it were true that I am a presidential aspirant, does that fact justify a combination by a host of other presidential aspirants, each of whom may imagine that his success depends upon my destruction, and the prosecuting a crusade against me for boldly avowing now the same principles to which they and I were pledged at the last presidential election? Is this a sufficient excuse for devising a new test of political orthodoxy? . . . I prefer the position of Senator or even that of a private citizen, where I would be at liberty to defend and maintain the well-defined principles of the Democratic party, to accepting a presidential nomination upon a platform incompatible with the principle of self-government in the Territories, or the reserved rights of the States, or the perpetuity of the Union under the Constitution."*

This declaration very clearly defined the issue on one side. On the other side it was also formulated with equal distinctness. Jefferson Davis, already recognized as the ablest leader of the Buchanan wing of the Democratic Senators, wrote and submitted to the United State Senate, on February 2d, 1860, a series of resolutions designed to constitute the Administration or Southern party doctrines, which were afterward revised and adopted by a caucus of Democratic Senators.† These resolutions expressed the usual party tenets; and on two of the controverted points asserted dogmatically exactly that which Douglas had stigmatized as an intolerable heresy. The fourth resolution declared —

"That neither Congress nor a Territorial legislature, whether by direct legislation or legislation of an indirect and unfriendly character, possesses power to annul or impair the Constitutional right of any citizen of the United States to take his slave property into the common Territories, and there hold and enjoy the same while the Territorial condition remains."—Globe, March 1st, 1860, p. 935.

While the fifth resolution declared —

"That if experience should at any time prove that the judiciary and executive authority do not possess means to insure adequate protection to constitutional rights in a Territory, and if the Territorial government shall fail or refuse to provide the necessary remedies for that purpose, it will be the duty of Congress to supply such deficiency."

Party discipline was so strong among the Democrats that public expectation looked somewhat confidently to at least a temporary agreement or combination which would enable the factions, by a joint effort, to make a hopeful presidential campaign. But no progress whatever was made in that direction. As the clans gathered at Charleston, the notable difference developed itself, that while one wing was filled with unbounded enthusiasm for a candidate, the other was animated by an earnest and stubborn devotion to an idea.

"Douglas was the pivot individual of the Charleston Convention," wrote an observant journalist; "every delegate was for or against him; every motion meant to nominate or not nominate him; every parliamentary war was *pro or con* Douglas."‡ This was the surface indication, and, indeed, it may be said with truth, it was the actual feeling of the Northern faction of the Democratic party. Douglas was a genuinely popular leader. He had the power to inspire a pure personal enthusiasm. He had aroused such hero-worship as may be possible in modern times and in American politics. Beyond this, however, the Lecompton controversy, and his open persecution by the Buchanan Administration, made his leadership and his candidacy a necessity to the Northern Democrats.

With Southern Democrats the feeling went somewhat deeper. Forgetting how much they owed him in the past, and how much they might still gain through him in the future, they saw only that he was now their stumbling-block, the present obstacle to their full and final success. It was the Douglas doctrine, squatter sovereignty, and "unfriendly legislation," rather than the *man* which they had come to oppose, and were determined to put down. Any other individual holding these heresies would have been equally obnoxious. They had no candidate of their own; they worshiped no single leader; but they followed a principle with unfaltering devotion. They clung unswervingly not only to the property

‡ Halstead, Conventions of 1860.

theory, but advanced boldly to its logical sequence,—Congressional protection to slavery in the Territories.

Of the convention's preliminary work little is worth recording,—there were the clamor and protest of contesting delegations and small fire of parliamentary skirmishes, by which factions feel and measure each other's strength. Caleb Cushing was made permanent chairman, for the triple reason that he was from Massachusetts, that he was the ablest presiding officer in the body, and was for the moment filled with blind devotion to Southern views. The actual temper of the convention was made manifest by the ready agreement of both extremes to join battle in making the platform before proceeding to the nomination of candidates. The usual committee of one member from each State was appointed, and to it was referred the deluge of resolutions which had been showered upon the convention.

Had an amicable solution of the slavery issue been possible, this platform committee would have found it, for it labored faithfully to accomplish the miracle. But after three days and nights of fruitless suggestion and persuasion, the committee re-appeared in convention. Upon four points they had come to either entire or substantial agreement. In addition to formally re-affirming the Cincinnati platform of 1856, they advised the convention to favor, 1. The faithful execution of the fugitive slave law. 2. The protection of naturalized citizens. 3. The construction of a Pacific railroad. 4. The acquisition of the Island of Cuba. But upon the principal topic, the question of slavery in the Territories, they felt compelled to report that even an approximate unanimity was impossible. In undisguised sorrow they proceeded to present two radically different reports. The convention, not yet in the least realizing that the great Democratic party had suffered fatal shipwreck in the secret caucus-room, listened eagerly to the re-

ports and explanatory speeches of the majority and minority of the committee.

The majority report * planted itself squarely upon the property theory and Congressional protection. Mr. Avery, of North Carolina, said it was presented in the name of 17 States with 127 electoral votes, every one of which would be cast for the nominee. He argued that in occupying new Territories Southern men could not compete with emigrant-aid societies at the North. These could send a voter to the Territories for the sum of \$200, while it would cost a Southern man \$1500. Secure political power by emigration, and permit the Territorial legislatures to decide the slavery question, and the South would be excluded as effectually as by the Wilmot proviso. Cuba must be acquired, and the flag of this great country must float over Mexico and the Central American States. But if you apply this doctrine of popular sovereignty, and establish a cordon of free States from the Pacific to the Atlantic, where in the future are the South to emigrate? They asked the equal right to emigrate with their property, and protection from Congress during the Territorial condition. They would leave it to the people in convention assembled, when framing a State constitution, to determine the question of slavery for themselves. They had no purpose but to have a vexed question settled, and to put the Democratic party on a clear, unclouded platform, not a double-faced one—one face to the North and one face to the South.

Henry B. Payne, of Ohio, presented and defended the report of the minority.† It asserted that all questions in regard to property in States or Territories are judicial in their character, and that the Democratic party will abide by past and future decisions of the Supreme Court concerning them. Mr. Payne explained that while the majority report was supported by fifteen slave and two free States,‡ representing 127 electoral votes, the minority

* MAJORITY REPORT.

"Resolved, That the platform adopted at Cincinnati be affirmed, with the following resolutions:

"Resolved, That the Democracy of the United States hold these cardinal principles on the subject of slavery in the Territories: First. That Congress has no power to abolish slavery in the Territories. Second. That the Territorial legislature has no power to abolish slavery in any Territory, nor to prohibit the introduction of slaves therein, nor any power to exclude slavery therefrom, nor any power to destroy or impair the right of property in slaves by any legislation whatever.

"Resolved, That it is the duty of the Federal Government to protect, when necessary, the rights of persons and property on the high seas, in the Territories, or wherever else its constitutional authority extends."

† MINORITY REPORT.

"Resolved, That we, the Democracy of the Union,

in convention assembled, hereby declare our affirmation of the resolutions unanimously adopted and declared as a platform of principles by the Democratic Convention at Cincinnati in the year 1856, believing that Democratic principles are unchangeable in their nature when applied to the same subject-matters; and we recommend as the only further resolutions, the following:

"Resolved, That all questions in regard to the rights of property in States or Territories arising under the Constitution of the United States are judicial in their character, and the Democratic party is pledged to abide by and faithfully carry out such determination of these questions as has been, or may be made by the Supreme Court of the United States."

‡ Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, Arkansas, Missouri, Tennessee, Kentucky, California, Oregon.

report was indorsed by fifteen free States,* representing 176 electoral votes. He argued that, by the universal consent of the Democratic party, the Cincinnati platform referred this question of slavery to the people of the Territories, declaring that Congress shall in no event intervene one way or the other, and that all controversies shall be settled by the courts. Now the proposition of the majority report is to make a complete retraction of those two cardinal doctrines of the Cincinnati platform. The Northern mind has become thoroughly imbued with this great doctrine of popular sovereignty. You cannot tear it out of their hearts unless you tear out their heart-strings themselves. "I repeat, that upon this question of Congressional non-intervention we are committed by the acts of Congress, we are committed by the acts of National Democratic Conventions; we cannot recede without personal dishonor, and, so help us God, we never will recede!"

Between these extremes of recommendation another member of the platform committee — Benjamin F. Butler, of Massachusetts — proposed a middle course. He advocated the simple re-affirmance of the Cincinnati platform. If it had suffered a double interpretation, so had the Bible and the Constitution of the United States. But beyond serving to consume time and amuse the convention, Mr. Butler's speech made no impression. The real tournament of debate followed, between William L. Yancey, of Alabama, and Senator Pugh, of Ohio.

It turned out in the end that Mr. Yancey was the master-spirit of the Charleston Convention, though that body was far from entertaining any such suspicion at the beginning. In exterior appearance he did not fill the portrait of the traditional fire-eater. He is described as "a compact middle-sized man, straight-limbed, with a square-built head and face, and an eye full of expression;" "a very mild and gentlemanly man, always wearing a genuinely good-humored smile, and looking as if nothing in the world could disturb the equanimity of his spirits."† He had, besides, a marvelous gift of persuasive oratory. He was the Wendell Phillips of the South, for, like his Northern rival, he was a born agitator. Above all his colleagues, he was the brain and soul and irrepressible champion of the pro-slavery reaction throughout the Cotton States. He was

tireless and ubiquitous; traveling, talking, writing, lecturing, animating every intrigue, directing every caucus, making speeches and drafting platforms at every convention. To defend, propagate, and perpetuate African slavery was his mission. He was the ultra of the ultras, accepting the institution as morally right and divinely sanctioned, desiring its extension and inclined to favor, though not then himself advocating the re-opening of the African slave-trade. He held that all Federal laws prohibiting such trade ought to be repealed so that each State might decide the question for itself. Still more, Mr. Yancey was not only an agitator and fire-eater, but for years an insidious, persevering conspirator to promote secession. Occupying such a position, he was naturally the champion of the Cotton States at Charleston. The defense of the ultra demands of the South was by common consent devolved upon him,‡ and it was understood long beforehand that he was prepared with the principal speech from that side.

In full consciousness of the fact that he and his colleagues were then at Charleston with a predetermination to force a programme of disruption expressly designed as a prelude to intended disunion, Mr. Yancey stood up and with smiling face and silvery tones assured his hearers that he and his colleagues from Alabama were not disunionists *per se*. Then he proceeded with his speech. Only its key-note was new, but the novelty was of startling import to Northern delegates. The Northern Democrats, he stated, were losing ground and falling before their victorious adversaries. Why? Because they had tampered with, and pandered to, the antislavery sentiment. They had admitted that slavery was wrong. This was surrendering the very citadel of their argument. They must reform their lines and change their tactics. They must come up to the high requirements of the occasion and take a new departure. The remainder of his speech was an insinuating plea for the property doctrine and Congressional intervention, for which the galleries and convention rewarded him with long and earnest applause. Even if the great Southern agitator's speech had been wanting in point and eloquence, success was supplied by the unmistakable atmosphere and temper of this great Charleston audience.

The more astute of the Douglas delegates were struck with the dismay of a new revela-

* Maine, New Hampshire, Vermont, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa, Minnesota. Massachusetts presented a separate report through Mr. Butler, but her electoral vote is included in Mr. Payne's estimate.

† Halstead, *The Conventions of 1860*, pp. 5, 48.

‡ "The leadership at Charleston, in this attempt to divide and destroy the Democratic party, was intrusted to appropriate hands. No man possessed the ability, or the courage, or the sincerity in his object for such a mission in a higher degree than the gifted Yancey." — Douglas, Senate speech, May 16th, 1860; Appendix to Congressional Globe, page 313.

tion. Their cause was lost — their party was gone. Senator Pugh, of Ohio, resented the dictation of the advocates of slavery in a warmth of just indignation. He thanked God that at last a bold and honest man had told the whole truth of the demands of the South. It was now before the country that the South did demand an advanced step from the Democratic party. He accurately traced the downfall of the Northern Democracy to her changing and growing exactions. Taunted with their weakness, they were now told they must put their hands on their mouths and their mouths in the dust. "Gentlemen of the South," said Mr. Pugh, "you mistake us — we will not do it."

Such language had never been heard in a Democratic National Convention, and the hall was as still as a funeral. This was Friday night, the fifth day of the convention. "A crisis" had long been whispered of as the skeleton in the party closet. It seemed to be at hand, and in a parliamentary uproar the "question" was vehemently demanded, but the chairman skillfully managed at length to secure an adjournment.

The "crisis" had in reality come on Thursday night, in the committee-room, in the hopeless first double report of its platform committee. The dissolution of the convention did not take place till the Monday following. A great party, after a vigorous and successful life of thirty years, could not die easily. The speeches of Avery and Payne, of Yancey and Pugh, on Friday, were recognized as cries of defiance, but not yet accepted as moans of despair. On Saturday morning, President Buchanan's lieutenant, Bigler, of Pennsylvania, essayed to ride the storm and steer to a Southern victory. But he only succeeded in securing a recommittal of both platforms to

the committee. Nothing, however, was gained by the manoeuvre. Saturday afternoon the committee once more reported the same disagreement in slightly changed phraseology; * two antagonistic platforms, presenting the same sharp difference of principle — one demanding Congressional intervention, the other insisting upon Congressional non-intervention. Then the parliamentary storm was unloosed for the remainder of that day with such fury that the chairman declared his physical inability to continue a contest with six hundred gentlemen as to who should cry the loudest, and threatened to leave the chair. On Monday, April 30th, the seventh day of the convention, a final decision was reached. By a vote of 165 to 138, the convention voted to substitute the minority report for that of the majority; in other words, to adopt the Douglas non-intervention platform.

The explosion was near, but still delayed, and the Cotton-States delegates sat sullenly through a tangle of routine voting. Finally, the question was put on Butler's proposition to adopt the Cincinnati platform pure and simple. This was the red flag to the mad bull. Mississippi declared that the Cincinnati platform was a great political swindle on one half the States of the Union; and from that time on, though a large affirmative vote sustained the proposition (237½ to 65), the Cotton States ceased to act as a part of the convention. As soon as a lull in the proceedings permitted, Mr. Yancey put in execution his programme of demand, disruption, disunion, and rebellion, labored for through long years, and announced by himself, with minute distinctness, three months before.† Led by the Alabama delegation, the Cotton States, — Alabama, Mississippi, Louisiana, South Carolina, Florida, Tex-

* SECOND MAJORITY REPORT.

"*Resolved*, That the platform adopted by the Democratic party at Cincinnati be affirmed with the following explanatory resolutions:

"*First*. That the government of a Territory organized by an act of Congress is provisional and temporary, and, during its existence, all citizens of the United States have an equal right to settle with their property in the Territory without their rights, either of person or property, being destroyed or impaired by Congressional or Territorial legislation.

"*Second*. That it is the duty of the Federal Government in all its departments, to protect, when necessary, the rights of persons and property in the Territories, and wherever else its constitutional authority extends.

"*Third*. That when the settlers in a Territory having an adequate population, form a State constitution, the right of sovereignty commences, and, being consummated by admission into the Union, they stand on an equal footing with the people of other States, and the State thus organized ought to be admitted into the Federal Union, whether its constitution prohibits or recognizes the institution of slavery."

SECOND MINORITY REPORT.

"*1. Resolved*, That we, the Democracy of the Union, in convention assembled, hereby declare our affirmance of the resolutions unanimously adopted and declared as a platform of principles by the Democratic Convention at Cincinnati, in the year 1856, believing that democratic principles are unchangeable in their nature when applied to the same subject-matters; and we recommend as the only further resolutions the following:

† "To obtain the aid of the Democracy in this contest, it is necessary to make a contest in its Charleston Convention. In that body Douglas's adherents will press his doctrines to a decision. If the State-Rights men keep out of that convention, that decision must

CALEB CUSHING. (FROM A PHOTOGRAPH BY BRADY.)

as, and Arkansas,—with protests and speeches, with all the formality and “solemnity” which the occasion allowed, seceded from the Charleston Convention, and withdrew from the deliberations of Institute Hall.

That same Monday night the city of Charleston held a grand jubilee. Music, bonfires, and

extravagant declamation held an excited crowd in Court-house Square till a late hour; and in a high-wrought peroration Yancey prophesied, with all the confidence and exultation of a triumphant conspirator, that “perhaps even now the pen of the historian was nibbed to write the story of a new revolution.”

covered by the agents of the South, and that either in direct favor of the Douglas doctrine, or by the indorsement of the Cincinnati platform, under which Douglas claims shelter for his principles.” “The State-Rights men should present in that convention their demands for a decision, and they will obtain an indorsement of their demands, or a denial of these demands. If indorsed, we shall have a greater hope of triumph within the

Union. If denied, in my opinion, the State-Rights wing should secede from the convention, and appeal to the whole people of the South, without distinction of parties, and organize another convention upon the basis of their principles, and go into the election with a candidate nominated by it, as a grand constitutional party. But in the presidential contest a black Republican may be elected. If this dire event should happen,

in my opinion the only hope of safety for the South is in a withdrawal from the Union before he shall be inaugurated; before the sword and treasury of the Federal Government shall be placed in the keeping of that party. I would suggest that the several State legislatures should by law require the governor, when it shall be made manifest that the black Republican candidate for the Presidency shall receive a majority of the electoral vote, to call a convention of the people of the State, to assemble in time to provide for their safety before the 4th of March, 1861. If, however, a black Republican should not be elected, then, in pursuance of the policy of making this contest within the Union, we should initiate measures in Congress which should lead to a repeal of all the unconstitutional acts against slavery. If we should fail to obtain so just a system of legislation, then the South should seek her independence out of the Union."—Speech of W. L. Yancey before the Alabama Democratic Convention, January, 1860.

The authors copy this declaration of Mr. Yancey from a campaign pamphlet issued by the central committee of the Douglas party, in Washington, in 1860. They have been unable to find the original newspaper report, but the corroboration and fulfillment of the plot here indicated are found in the official proceedings of the Alabama Convention and the Alabama Legislature. The convention on January 13th, 1860, expressly instructed its delegation at Charleston to secede in case the ultra-Southern doctrines were not incorporated in the National Democratic platform, and sent Mr. Yancey as a delegate to execute their instructions, which he did as the text states. The Alabama Legislature, on its part, passed a joint resolution, which the governor approved, February

W. L. YANCEY. (FROM A PHOTOGRAPH BY COOK.)

24th, 1860, providing "that upon the election of a President advocating the principles and action of the party in the Northern States calling itself the Republican party," the governor should forthwith call a convention of the State. This convention was duly called after the election of Lincoln, and passed the secession ordinance of Alabama.

IS IT A PIECE OF A COMET?

"Of star-dust and star-pilgrimages"—

HERE has recently come into my possession *the ninth* iron meteorite whose fall to the earth has been observed. It is, moreover, the first meteorite which seems to evidence a direct connection with a star-shower. The mass acquires still further interest from the fact that it is presumably a fragment of the famous comet of Biela.

A brief account of this celestial wanderer will doubtless be of interest to the readers of *THE CENTURY*, in which magazine the essays of the astronomer Langley have recently appeared.

Astronomers have waited patiently for the

fall to the earth's surface, at the time of the periodical star-showers, of something *tangible*, but until now they have waited in vain.

In looking over a considerable amount of astronomical literature, only one record can be found of the falling of a body to the earth at such a time; this was near Paris, on the 10th of April, 1094, when "many shooting-stars were seen, and a very large one was said to have been found on the ground as a glowing substance."

From the 24th to the 29th of November, 1885, the earth was passing through a train of meteors that proceeded from the constellation Andromeda, and once formed a part of Biela's comet. These meteors are now known to astronomers as Andromedes or Bielids. The

FIGURE 1. THE MAZATLÁN METEORITE; NATURAL SIZE.

maximum of this shower occurred on the 27th, while it was yet broad daylight over America, and at an hour corresponding to 11 A. M. at Mazatlán, Mexico. Thus, at the time of the fall of this meteorite, ten hours after the maximum number of meteors was observed, the earth was meeting with only the stragglers of the train. It cannot be doubted that the cosmical dust proceeding from the disintegration of Biela's Comet wholly enveloped the earth and was seen as meteors from every part of it. Such was the magnificence of the celestial phenomenon that in some parts of the Eastern Continent uneducated people believed there would be no stars left in the sky.

Of the countless host of meteors which crossed the earth's path on this 27th of November, only one is as yet known to have reached the earth's surface, and this fell near the village of Mazatlán, in the state of Zacatecas, Mexico (see map, Fig. 2), at about 9 o'clock in the evening. It is of the rare iron-nickel variety, and weighs ten and a quarter pounds troy. Fig. 1 shows it in natural size, full view.

This meteorite was presented to me by Sr. José A. y Bonilla, Director-Professor of the Zacatecas Observatory, who received it, five days after its fall, from the ranchman who saw it descend from the heavens. This ranchman

FIGURE 2. MAZAPIL AND VICINITY.

related the strange occurrence as follows (translated from the Spanish):

"It was at about 9 o'clock on the night of November 27th, when I went out to the corral to feed certain horses; suddenly, I heard a loud sizzling noise, exactly as though something red-hot was being plunged into cold water, and almost instantly there followed a somewhat loud thud. At once the corral was covered with a phosphorescent light, while suspended in the air were small luminous sparks as though from a rocket. I had not recovered from my surprise before I saw this luminous air disappear, and there remained on the ground only such a light as is made when a match is rubbed. A number of people came running toward me from the neighboring houses, and they assisted me in quieting the horses, which had become very much excited. We all asked each other what could be the matter, and we were afraid to walk in the corral for fear of being burned. When, in a few moments, we had recovered from our fright we saw the light disappear, and bringing lanterns to look for the cause, we found a hole in the ground and in it a ball of light. We retired to a distance, fearing it would explode and harm us. Looking up to the sky, we saw from time to time exhalations or stars, which soon went out without noise. We returned after a little, and found in the hole a hot stone which we could barely handle; this on the next day, we saw, looked like a piece of iron. All night it rained stars, but we saw none fall to the ground, as they all seemed to be extinguished while yet very high up."

Upon further inquiry we learn that there was no explosion or detonation heard, and that the mass penetrated the earth only to a depth of twelve inches.

This very circumstantial account leads us to believe that this meteorite is the first one to be secured and preserved that has come to the earth during a star-shower.

That no explosion or loud detonation accompanied the fall, as is usually the case, is paralleled by similar occurrences at Wold Cottage, in Yorkshire, England, on December 13th, 1795, and at Ghent, in Flanders, on June 7th, 1855; also at Stålldalen in Sweden, on the 28th of June, 1876, when a num-

ber of meteorites fell, and it was remarked that "while the luminous meteor and explosions were noted over nearly all Sweden, they were not observed at the locality of the fall."

Perhaps never, previous to this fall at Mazapil, were such peculiar phenomena observed. The phosphorescent light, seen in the air and on the ground, has special significance, and was probably caused by surface fusion, due to friction with the atmosphere, and by the detached matter falling along with the meteorite as an incandescent powder. The oft-expressed wish that we might have one of these meteoroids from the star-streams to handle and to analyze and thus to learn something of its history, seems now to be gratified; and the remark of Professor Langley "that the advance of science is much more likely to show the kernel or nucleus of the comet is but some large meteorite" is seemingly proved. Furthermore, that there is no material difference between shooting-stars—great or small—seems now established. If these meteors are small—no larger than pebbles—they would be entirely volatilized in their journey through the earth's atmosphere; but if they were larger, only the outer portion would be consumed, and the mass would strike the earth. That they are solids is plainly shown by their luminosity. That they are not liquified gases, as has been suggested, is clearly proved by the absence of the necessary surrounding pressure so essential to such a condition.

As to the light seen, the following may have a bearing on that observation: On May 26th, 1751, two masses of iron (now preserved in the Imperial Cabinet at Vienna), weighing 16 and 71 pounds, whose surfaces resemble the Mazapil iron in a marked degree, fell near Hraschina, in Croatia, in daylight. A vapory cloud survived the fall for fully an hour, before being entirely dissipated. Had this cloud been seen at night, it might have been phosphorescent like the luminous air which followed the Mazapil meteorite.

The crust on this mass of iron is very interesting, and on all meteorites is an ever-present and uniform characteristic. Its black color and lines of flow are due to superficial fusion while the mass is whirling and rotating in its rapid flight. Ordinarily the crust is very thin—say the fiftieth of an inch—and is rarely over one-tenth of an inch; fusion is written in unmistakable terms in every part of it. Of special interest is Fig. 3, as showing the flow of the melted crust over a projecting edge of the meteorite's surface. The hollowed depressions are unusually well marked. They have often been compared to thumb-marks, and are probably due to the scooping action of the air which the meteorite enters, at first, with

enormous speed. When we consider the thin dark crust of this mass of celestial iron, we cannot refrain from comparing it to the soil of this earth, which is really all of earth men know. With all the record of the rocks, we cannot yet claim acquaintance with more than the one-three-hundredth of the earth's thickness; or far less proportionally than is the shell to the egg.

Wishing to show the internal structure of the Mazapil iron, the writer had a slab sawed from the site opposite to that shown in Fig. 1, and this surface being acted upon by dilute nitric acid resulted in the appearance shown in Fig. 4 (natural size). These markings are known as the figures of Widmanstätten, and are peculiar to meteoric irons; they serve as a means of ready identification of such masses. This map-like plan resembles much that of a city, and is in strange contrast to the meteorite's rough exterior. The cause of these lines is the selective affinity of the metal molecules and the extrusion of the rejected matter; or, in other words, these lines show the uniform crystallization of the mass; which process of arrangement is always a purifying one.

A complete chemical analysis of the meteorite of Mazapil merits a place here, if only as a comparison with the iron meteorites of other dates. Mr. James B. Mackintosh, E. M., of the Lehigh University, detached with no little difficulty a compact and unoxidized portion of the mass which was free from the associated graphite and obtained the following results,—iron, 91.26%; nickel, 7.84%; cobalt, 0.65%; phosphorus, 0.30%, with traces of carbon, sulphur, and chlorine. Strangely, this composition pertains to the majority of meteoric irons, as if it were the normal composition of this class of celestial bodies. With very slight differences (often less than one per cent.) the iron meteorites which were seen to fall have this same composition.

With the spectroscope the Bielid meteors were seen to be rich in carbon and iron. The above analysis substantiates beautifully the spectroscopic tests. The Mazapil iron has large compact nodules of carbon in the form of graphite (black-lead). Eleven of these nodules can be seen extruding from the surface; one is nearly an inch in diameter. While this feature is interesting in the extreme, it is not unique, since several of the meteoric irons contain included carbon in nodular form.

We are thus led to think that this earth and the meteorites are all of one common parentage, especially as we find in the meteorites nothing new or strange. To be sure the iron, nickel, and cobalt are uncommon terrestrial occurrences, but these elements are found on

the earth, in a metallic condition, in basaltic and other plutonic rocks which are closely related to the stony meteorites.

As to the place of impact, or the spot on this mass which struck the earth first, the abrasion was very slight. The resistance of the earth's atmosphere—which we move through as though it were nothing—offered, as it were, a buffer, which reduced the speed of the meteorite to little more than that which would be due to

FIGURE 3. CRUST ON METEORITE. (MAGNIFIED TWO DIAMETERS.)

gravitation alone. Had the mass simply fallen a few hundred feet, it could have hardly received less damage.

I have thus treated of the fall, crust, internal structure, and composition of this new meteorite, and will now ask the reader to look to the probable origin of its parental comet. Allowing it to be a fragment of a comet does not help us very far on the track of its ancestry, yet to show where comets most probably have their birthplace would be an endeavor to state the full pedigree of this meteorite.

Some astronomers hold that comets are the "scavengers of space" and have accreted their mass and motion by the simple laws of gravitation and of chemical affinity; but that they had their origin within some sun seems equally as probable, especially, when we study their debris in the form of meteorites.

We have the evidence from Daubrée and others that "meteorites are absolutely identical in structure with terrestrial products, such as are found only deep beneath the surface. They were formed, it is certain, under such conditions of high temperature and tremendous pressure as only can exist deep within the mass of a planet or a sun." Graham and others have shown that iron meteorites contain such quantities of gases, as indicate an origin in a region occupied by hydrogen in a state of great chemical activity, convincing us that such meteorites have brought to us across the stellar

FIGURE 4. WIDMANSTÄTTEN FIGURES OF THE MAZAPIL METEORITE.

depths the material matter of some fixed star or sun.

Therefore, as Mr. Proctor has conjectured,* there remains no other reasonable explanation save that meteor flights are products of some sort of planetary ejection or rejection, which was effected while a planet was in a sun-like stage. He writes:

"Our sun is the only case of a sun-like body we can inquire into; we are forced to the question, 'Can he eject solid bodies?' Those who imagine the eruption prominences of the sun to be what they seem to be—jets of glowing gas—may be disposed to answer in the negative. But may they not indicate the tracks of denser bodies not themselves visible because the spectroscope will not show bodies near the sun which shine with the spectral colors? It may doubtless be the case that of ejected meteoric bodies far the greater number return to the sun-like orb which expelled them, but if only one flight, or part of an outburst, escapes from the sun in a year, of how many thousands of such flights has he been the parent in the

* Letter to Editor N. Y. "Tribune." Sept. 20th, 1886.

past countless ages? Each flight would have been a comet and each component body a meteor, and thus we would have an explanation of such phenomena."

But before accepting this plausible idea of Mr. Proctor's as final, we must bring ourselves to believe that a celestial body has the power within itself to expel a part of itself beyond the sphere of its own attraction.

If, in conclusion, the fall of this meteorite shall be confirmed in all its interesting details at a recurrence of the Bielids, and the fact be established that it is in truth a piece of Biela's Comet, then its scientific importance could not be overestimated. Its close identity with the metallic meteorites of known fall, and of accidental discovery, would place them all in the same category of similar origin, and thus we could think of this class of meteorites as having come from some particular sun-system of stellar space; while for the stony meteorites, in their several varieties,—consistently with this thought—we would seek an origin in other regions of that infinite deep from which dust, starborn, comes to us as comets.

William Earl Hidden.

An iron-nickel meteorite, weighing one hundred and seven pounds, was announced, in the American Journal of Science of last June, as having been seen to fall on March 27th, 1886, in Johnson county, Arkansas; thus making the tenth mass of meteoric iron whose date of fall is a matter of record.

It is also necessary to state that "it appears questionable whether the 4th, 5th, and 6th in the list of iron meteorites *seen to fall* should be included, since no record of their fall has been published." The list

if thus corrected would be as follows: 1st, Hraschina, Croatia, May 26th, 1751; 2d, Charlotte, Dickson County, Tennessee, Aug. 1st, 1835; 3d, Braunau, Bohemia, July 14th, 1847; 4th, Nedagolla, India, Jan. 23d, 1870; 5th, Rowton, England, April 20th, 1876; 6th, Mazapil, Mexico, Nov. 27th, 1885; 7th, Johnson County, Arkansas, March 27th, 1886. The doubtful ones being those of Tabarz, Saxony; Victoria-West, Africa; and Nejed, Arabia.—W. E. H.

I SHALL FIND REST.

A little further on —

There will be time — I shall find rest anon :
Thus do we say, while eager youth invites
Young hope to try her wings in wanton flights,
And nuzzle fancy builds the soul a nest
On some far crag ; but soon youth's flame is gone —
Burned lightly out — while we repeat the jest
With smiling confidence, — I shall find rest
A little further on.

A little further on

I shall find rest ; half-fiercely we avow
When noon beats on the dusty field and care
Threats to unjoint our armor, and the glare
Throbs with the pulse of battle, while life's best
Flies with the flitting stars : the frenzied brow
Pains for the laurel more than for the breast
Where Love soft-nestling waits. Not now, not now,
With feverish breath we cry, I shall find rest
A little further on.

A little further on

I shall find rest : half-sad, at last, we say,
When sorrow's settling cloud blurs out the gleam
Of glory's torch, and to a vanished dream
Love's palace hath been turned, then — all depressed,
Despairing, sick at heart — we may not stay
Our weary feet, so lonely then doth seem
This shadow-haunted world. We, so unblest,
Weep not to see the grave which waits its guest ;
And feeling round our feet the cool, sweet clay,
We speak the fading world farewell and say :
Not on this side — alas ! — I shall find rest
A little further on.

Robert Burns Wilson.

VIRGO.

VIRGIN august ! come in thy regal state
With soft majestic grace and brow serene ;
Though the fierce Lion's reign is overpast
The Summer's heart is all thine own as yet,
And all untouched thy robe of living green
By the rude fingers of the northern blast.
Thy brooding smile holds hint of no regret
For waning suns or dread of autumn keen ;
In full fruition is thy beauty set
Amid thy sheaves, the glad earth's crowned
queen.
Where shall we find, O royal maid, thy peer !
Not thine the fickle brightness of the Spring,
Nor the false splendor of the dying year ;

No need hast thou to go a-borrowing
New charm from change : thy still perfection
leaves
No charm so perfect as its golden rest ;
And through thy slumbrous noons and mel-
low eves,
Lulled by the harvest-scented airs that sing
Of garnered Summer and her labors blest,
We dreaming count the slow, sweet hours that
pass
As diamond dust within Time's magic glass,
And sigh in full content thy perfect praise :
" There is no joy but calm — the calm of
August days ! "

R. J. Philbrick.

"MARSE PEYTON! SEEM LIKE I WA'N'T NEVER GWINE TER GIT YER." (PAGE 544.)

AZALIA.

By the author of "Uncle Remus," "Little Compton," etc.

I.

MISS Helen Osborne Eustis, of Boston, was very much astonished one day in the early fall of 1873 to receive a professional visit from Dr. Ephraim Buxton, who for many years had been her father's family

physician. The astonishment was mutual, for Dr. Buxton had expected to find Miss Eustis in bed, or at least in the attitude of a patient, whereas she was seated in an easy-chair, before a glowing grate,—which the peculiarities of the Boston climate sometimes render necessary even in the early fall,—and appeared to be about as comfortable as a human being could well be. Perhaps the appearance of comfort was heightened by the general air of subdued luxury that pervaded the apartment into which Dr. Buxton had been ushered. The draperies, the arrangement of the little affairs that answer to the name of bric-à-brac, the adjustment of the furniture—everything—conveyed the impression of peace and repose; and the chief element of this perfect harmony was Miss Eustis herself, who rose to greet the doctor as he entered. She regarded the physician with eyes that somehow seemed to be wise and kind, and with a smile that was at once sincere and humorous.

"Why, how is this, Helen?" Dr. Buxton exclaimed, taking off his spectacles and staring at the young lady. "I fully expected to find you in bed. I hope you are not imprudent."

"Why should I be ill, Dr. Buxton? You know what Mr. Tom Appleton says? 'In Boston, those who are sick do injustice to the air they breathe and to their cooks.' I think that is a patriotic sentiment, and I try to live up to it. My health is no worse than usual, and usually it is very good," said Miss Eustis.

"You certainly seem to be well," said Dr. Buxton, regarding the young lady with a professional frown; "but appearances are sometimes deceitful. I met Harriet yesterday—"

"Ah, my aunt!" exclaimed Helen, in a tone calculated to imply that this explained everything.

"I met Harriet yesterday, and she insisted

on my coming to see you at once, certainly not later than to-day."

Miss Eustis shrugged her shoulders and laughed, but her face showed that she appreciated this manifestation of solicitude.

"Let me see," she said reflectively; "what was my complaint yesterday? We must do justice to Aunt Harriet's discrimination. She would never forgive you if you went away without leaving a prescription. My health is so good that I think you may leave me a mild one."

Unconsciously the young lady made a charming picture as she sat with her head drooping a little to one side in a half-serious, half-smiling effort to recall to mind some of the symptoms that had excited her aunt's alarm. Dr. Buxton, prescription-book in hand, gazed at her quizzically over his old-fashioned spectacles; seeing which Helen laughed heartily. At that moment her aunt entered the room—a pleasant-faced but rather prim old lady, of whom it had been said by some one competent to judge, that her inquisitiveness was so overwhelming and so important that it took the shape of pity in one direction, patriotism in another, and benevolence in another, giving to her life not the mere semblance, but the very essence of usefulness and activity.

"Do you hear that, Dr. Buxton?" cried the pleasant-faced old lady somewhat sharply. "Do you hear her wheeze when she laughs? Do you remember that she was threatened with pneumonia last winter? and now she is wheezing before the winter begins!"

"This is the trouble I was trying to think of," exclaimed Helen, sinking back in her chair with a gesture of mock despair.

"Don't make yourself ridiculous, dear," said the aunt, giving the little clusters of gray curls that hung about her ears an emphatic shake. "Serious matters should be taken seriously." Whereat Helen pressed her cheek gently against the thin white hand that had been laid caressingly on her shoulder.

"Aunt Harriet has probably heard me say that there is still some hope for the country, even though it is governed entirely by men," said Helen, with an air of apology. "The men cannot deprive us of the winter climate of Boston, and I enjoy that above all things."

Aunt Harriet smiled reproachfully at her niece, and pulled her ear gently.

"But, indeed, Dr. Buxton," Helen went on more seriously, "the winter climate of Boston, fine as it is, is beginning to pinch us harder than it used to do. The air is thinner, and the cold is keener. When I was younger—very much younger—than I am now, I remember that I used to run in and out, and fall and roll in the snow with perfect impunity. But now I try to profit by Aunt Harriet's example. When I go out, I go bundled up to the point of suffocation, and if the wind is from the east, as it usually is, I wear wraps and shawls indoors."

Helen smiled brightly at her aunt and at Dr. Buxton, but her aunt seemed to be distressed, and the physician shook his head dubiously.

"You will have to take great care of yourself," said Dr. Buxton. "You must be prudent. The slightest change in the temperature may send you to bed for the rest of the winter."

"Dr. Buxton is complimenting you, Aunt Harriet," said Helen. "You should drop him a curts'y."

Whereupon the amiable physician, seeing that there was no remedy for the humorous view which Miss Eustis took of her condition, went further and informed her that there was every reason why she should be serious. He told her, with some degree of bluntness, that her symptoms, while not alarming, were not at all reassuring.

"It is always the way, Dr. Buxton," said Helen, smiling tenderly at her aunt; "I believe you would confess to serious symptoms yourself if Aunt Harriet insisted on it. What an extraordinary politician she would make! My sympathy with the woman suffrage movement is in the nature of an investment. When we women succeed to the control of affairs, I count on achieving distinction as Aunt Harriet's niece."

Laughing, she seized her aunt's hand. Dr. Buxton, watching her, laughed too, and then proceeded to write out a prescription. He seemed to hesitate a little over this; seeing which, Helen remonstrated:

"Pray, Dr. Buxton, don't humor Aunt Harriet too much in this. Save your physic for those who are strong in body and mind. A dozen of your pellets ought to be a year's supply." The physician wrote out his prescription and took his leave, laughing heartily at the amiable confusion in which Helen's drollery had left her aunt.

It is not to be supposed, however, that Miss Eustis was simply droll. She was unconventional at all times, and sometimes willful,—inheriting that native strength of mind and

mother-wit which are generally admitted to be a part of the equipment of the typical American woman. If she was not the ideal young woman, at least she possessed some of the attractive qualities that one tries—sometimes unsuccessfully—to discover in one's dearest friends. From her infancy until near the close of the war she had had the advantage of her father's companionship, so that her ideas were womanly rather than merely feminine. She had never been permitted to regard the world from the dormer-windows of a young ladies' seminary, in consequence of which her views of life in general, and of mankind in particular, were orderly and rational. Such indulgence as her father had given her had served to strengthen her individuality rather than to confirm her temper, and, though she had a strong and stubborn will of her own, her tact was such that her willfulness appeared to be the most natural, as well as the most charming thing in the world. Moreover, she possessed in a remarkable degree that buoyancy of mind that is more engaging than mere geniality.

Her father was no less a person than Charles Osborne Eustis, the noted philanthropist and abolitionist whose death, in 1867, was the occasion of quite a controversy in New England—a controversy based on the fact that he had opposed some of the most virulent schemes of his co-workers at a time when abolitionism had not yet gathered its full strength. Mr. Eustis, in his day, was in the habit of boasting that his daughter had a great deal of genuine American spirit—the spirit that one set of circumstances drives to provinciality, another to patriotism, and another to originality.

Helen had spent two long winters in Europe without parting with the fine flavor of her originality. She was exceedingly modest in her designs, too, for she went neither as a missionary nor as a repentant. She found no foreign social shrines that she thought worthy of worshiping at. She admired what was genuine, and tolerated such shams as obtruded themselves on her attention. Her father's connections had enabled her to see something of the real home-life of England, and she was delighted, but not greatly surprised, to find that, at its best, it was not greatly different from the home-life to which she had been accustomed.

The discovery delighted her because it confirmed her own broad views; but she no more thought it necessary to set about aping the social peculiarities to be found in London drawing-rooms than she thought of denying her name or her nativity. She made many interesting studies and comparisons, but she

was not disposed to be critical. She admired many things in Europe which she would not have considered admirable in America, and whatever she found displeasing she tolerated as the natural outcome of social or climatic conditions. Certainly the idea never occurred to her that her own country was a barren waste because time had not set the seal of antiquity on its institutions. On the other hand, this admirable young woman was quick to perceive that much information as well as satisfaction was to be obtained by regarding various European peculiarities from a strictly European point of view.

But Miss Eustis's reminiscences of the Old World were sad as well as pleasant. Her journey thither had been undertaken in the hope of restoring her father's failing health, and her stay there had been prolonged for the same purpose. For a time he grew stronger and better, but the improvement was only temporary. He came home to die, and to Helen this result seemed to be the end of all things. She had devoted herself to looking after his comfort with a zeal and intelligence that left nothing undone. This had been her mission in life. Her mother had died when Helen was a little child, leaving herself and her brother, who was some years older, to the care of the father. Helen remembered her mother only as a pale, beautiful lady in a trailing robe, who fell asleep one day, and was mysteriously carried away — the lady of a dream.

The boy — the brother — rode forth to the war in 1862, and never rode back any more. To the father and sister waiting at home, it seemed as if he had been seized and swept from the earth on the bosom of the storm that broke over the country in that period of dire confusion. Even Rumor, with her thousand tongues, had little to say of the fate of this poor youth. It was known that he led a squad of troopers detailed for special service, and that his command, with small knowledge of the country, fell into an ambush from which not more than two or three extricated themselves. Beyond this all was mystery, for those who survived that desperate skirmish could say nothing of the fate of their companions. The loss of his son gave Mr. Eustis additional interest in his daughter, if that were possible; and the common sorrow of the two so strengthened and sweetened their lives that their affection for each other was in the nature of a perpetual memorial of the pale lady who had passed away, and of the boy who had perished in Virginia.

When Helen's father died, in 1867, her mother's sister, Miss Harriet Tewksbury, a spinster of fifty or thereabouts, who, for the lack of something substantial to interest her,

had been halting between woman's rights and spiritualism, suddenly discovered that Helen's cause was the real woman's cause; whereupon she went to the lonely and grief-stricken girl, and, with that fine efficiency which the New England woman acquires from the air and inherits from history, proceeded to minister to her comfort. Miss Tewksbury was not at all vexed to find her niece capable of taking care of herself. She did not allow that fact to prevent her from assuming a motherly control that was most gracious in its manifestations and peculiarly gratifying to Helen, who found great consolation in the all but masculine energy of her aunt.

A day or two after Dr. Buxton's visit, the result of which has already been chronicled, Miss Tewksbury's keen eye detected an increase of the symptoms that had given her anxiety, and their development was of such a character that Helen made no objection when her aunt proposed to call in the physician again. Dr. Buxton came, and agreed with Miss Tewksbury as to the gravity of the symptoms, but his prescription was oral.

"You must keep Helen indoors until she is a little stronger," he said to Miss Tewksbury, "and then take her to a milder climate."

"Oh, not to Florida!" exclaimed Helen promptly.

"Not necessarily," said the doctor.

"Please don't twist your language, Dr. Buxton. You should say necessarily not."

"And why not to Florida, young lady?" the doctor inquired.

"Ah, I have seen people that came from there," said Helen; "they were too tired to talk much about the country, but something in their attitude and appearance seemed to suggest that they had seen the sea-serpent. Dear Doctor, I have no desire to see the sea-serpent."

"Well, then, my dear child," said Dr. Buxton soothingly, "not to Florida, but to nature's own sanitarium, the pine woods of Georgia. Yes," the doctor went on, smiling as he rubbed the glasses of his spectacles with his silk handkerchief, "nature's own sanitarium. I tested the piney woods of Georgia thoroughly years ago. I drifted there in my young days. I lived there, and taught school there. I grew strong there, and I have always wanted to go back there."

"And now," said Helen, with a charmingly demure glance at the enthusiastic physician, "you want to send Aunt Harriet and poor Me forward as a skirmish line. There is no antidote in your books for the Ku Klux."

"You will see new scenes and new people," said Dr. Buxton, laughing. "You will get new ideas; above all, you will breathe the fresh

air of heaven spiced with the odor of pines. It will be the making of you, my dear child."

Helen made various protests, some of them serious and some droll, but the matter was practically settled when it became evident that Dr. Buxton was not only earnestly, but enthusiastically in favor of the journey; and Helen's aunt at once began to make preparations. To some of their friends it seemed a serious undertaking indeed. The newspapers of that day were full of accounts of Ku Klux outrages, and of equally terrible reports of the social disorganization of the South. It seemed at that time as though the politicians and the editors, both great and small, and of every shade of belief, had determined to fight the war over again — instituting a conflict which, though bloodless enough so far as the disputants were concerned, was not without its unhappy results.

Moreover, Helen's father had been noted among those who had early engaged in the crusade against slavery, and it was freely predicted by her friends that the lawlessness which was supposed to exist in every part of the collapsed Confederacy would be prompt to select the representatives of Charles Osborne Eustis as its victims. Miss Tewksbury affected to smile at the apprehensions of her friends, but her preparations were not undertaken without a secret dread of the responsibilities she was assuming. Helen, however, was disposed to treat the matter humorously.

"Dr. Buxton is a lifelong Democrat," she said; "consequently he must know all about it. Father used to tell him he liked his medicine better than his politics, bitter as some of it was; but in a case of this kind, Dr. Buxton's politics have a distinct value. He will give us the grips, the signs, and the pass-words, dear aunt, and I dare say we shall get along comfortably."

II.

THEY did get along comfortably. Peace seemed to spread her meshes before them. They journeyed by easy stages, stopping awhile in Philadelphia, in Baltimore, and in Washington. They staid a week in Richmond. From Richmond they were to go to Atlanta, and from Atlanta to Azalia, the little piney-woods village which Dr. Buxton had recommended as a sanitarium. At a point south of Richmond, where they stopped for breakfast, Miss Eustis and her aunt witnessed a little scene that seemed to them to be very interesting. A gentleman wrapped in a long linen traveling-coat was pacing restlessly up and down the platform of the little station. He was tall, and his bearing was distinctly military. The neighborhood people who were lounging around the station

watched him with interest. After a while a negro boy came running up with a valise which he had evidently brought some distance. He placed it in front of the tall gentleman, crying out in a loud voice: "Here she is, Marse Peyton," then stepped to one side and began to fan himself vigorously with the fragment of a wool hat. He grinned broadly in response to something the tall gentleman said, but, before he could make a suitable reply, a negro woman, fat and motherly-looking, made her appearance, puffing and blowing and talking.

"I declar' ter gracious, Marse Peyton! seem like I wa'n't never gwine ter git yer. I helt up my head, I did, fer to keep my eye on de kyars, en it look like I run inter all de gullies en on top er all de stumps 'twix' dis en Marse Tip's. I des tuck'n drapt eve'ything, I did, en tole um dey'd hatter keep one eye on de dinner-pot, kase I 'blige ter run en see Marse Peyton off."

The gentleman laughed as the motherly-looking old negro wiped her face with her apron. Her sleeves were rolled up, and her fat arms glistened in the sun.

"I boun' you some er deze yer folks 'll go off en say I'm 'stracted," she cried, "but I can't he'p dat; I bleeze ter run down yer to tell Marse Peyton good-bye. Tell um all howdy fer me, Marse Peyton," she cried, "all un um. No difference ef I ain't know um all — 'tain't gwine ter do no harm fer tell um dat old Jincy say howdy. Hit make me feel right foolish in de head w'en it come 'cross me dat I use ter tote Miss Hallie 'roun' w'en she wuz a little bit er baby, en now she way down dar out'n de worl' 'mos'. I wish ter de Lord I uz gwine 'long wid you, Marse Peyton! Yit I speck, time I got dar, I'd whirl in en wish myse'f back home."

The negro boy carried the gentleman's valise into the sleeping-coach, and placed it opposite the seats occupied by Helen and her aunt. Across the end was stenciled in white the name "Peyton Garwood." When the train was ready to start the gentleman shook hands with the negro woman and with the boy. The woman seemed to be very much affected.

"God-A'mighty bless you, Marse Peyton, honey!" she exclaimed, as the train moved off, and as long as Helen could see her she was waving her hands in farewell. Both Helen and her aunt had watched this scene with considerable interest, and now, when the gentleman had been escorted to his seat by the obsequious porter, they regarded him with some curiosity. He appeared to be about thirty-five years old. His face would have been called exceedingly handsome, but for a

scar on his right cheek, and yet, on closer inspection, the scar seemed somehow to fit the firm outlines of his features. His brown beard emphasized the strength of his chin. His nose was slightly aquiline, his eye-rows were a trifle ragged, and his hair was brushed straight back from a high forehead. His face was that of a man who had seen rough service and had enjoyed it keenly—a face full of fire and resolution, with some subtle suggestion of tenderness.

"She called him 'Master,' Helen," said Miss Tewksbury after a while, referring to the scene at the station; "did you hear her?" Miss Tewksbury's tone implied wrathfulness that was too sure of its own justification to assert itself noisily.

"I heard her," Helen replied. "She called him Master, and he called her Mammy. It was a very pleasing exchange of compliments."

Such further comment as the ladies may have felt called on to make—for it was a matter in which both were very much interested—was postponed for the time being. A passenger occupying a seat in the farther end of the coach had recognized the gentleman whose valise was labeled "Peyton Garwood," and now pressed forward to greet him. This passenger was a very aggressive-looking person. He was short and stout, but there was no suggestion of jollity or even of good humor in his rotundity. No one would have made the mistake of alluding to him as a fat man. He would have been characterized as the pudgy man; and even his pudginess was aggressive. He had evidently determined to be dignified at any cost, but his seriousness seemed to be perfectly gratuitous.

"Gener'l Garwood?" he said in an impressive tone, as he leaned over the tall gentleman's seat.

"Ah! Goolsby!" exclaimed the other, extending his hand. "Why, how do you do? Sit down."

Goolsby's pudginess became more apparent and apparently more aggressive than ever when he seated himself near General Garwood.

"Well, sir, I can't say my health's any too good. You look mighty well yourself, Gener'l. How are things?" said Goolsby, pushing his traveling-cap over his eyes, and frowning as if in pain.

"Oh, affairs seem to be improving," General Garwood replied.

"Well, now, I ain't so up and down certain about that, Gener'l," said Goolsby, settling himself back, and frowning until his little eyes disappeared. "Looks like to me that things git wuss and wuss. I ain't no big man, and I'm ruther disj'inted when it comes right down to politics, but, blame me, if it don't look to

me mighty like the whole of creation is driftin' 'round loose."

"Ah, well," said the general soothingly, "a great many things are uncomfortable; there is a good deal of unnecessary irritation growing out of new and unexpected conditions, but we are getting along better than we are willing to admit. We are all fond of grumbling."

"That's so," said Goolsby, with the air of a man who is willing to make any sacrifice for the sake of a discussion; "that's so. But I tell you we're havin' mighty tough times, Gener'l—mighty tough times. Yonder's the Yankees on one side, and here's the blamed niggers on t'other, and betwixt and betweenst 'em a white man's got mighty little chance. And then, right on top of the whole caboodle, here comes the panic in the banks, and the epizooty 'mongst the cattle. I tell you, Gener'l, it's tough times, and it's in about as much as an honest man can do to pay hotel bills and have a ticket ready to show up when the conductor comes along."

General Garwood smiled sympathetically, and Goolsby went on:

"Here I've been runnin' up and down the country tryin' to sell a book, and I ain't sold a hunderd copies sence I started—no, sir, not a hunderd copies. Maybe you'd like to look at it, Gener'l," continued Goolsby, stiffening up a little. "If I do say it myself, it's in about the best book that a man'll git a chance to thumb in many a long day."

"What book is it, Goolsby?" the general inquired.

Goolsby sprang up, waddled rapidly to where he had left his satchel, and returned, bringing a large and substantial-looking volume.

"It's a book that speaks for itself any day in the week," he said, running the pages rapidly between his fingers; "it's a history of our own great conflict—'The Rise and Fall of the Rebellion,' by Schuyler Paddleford. I don't know what the blamed publishers wanted to put it 'Rebellion' for. I told 'em, says I, 'Gentlemen, it'll be up-hill work with this in the Sunny South. Call it 'The Conflict,''" says I. But they wouldn't listen, and now I have to work like a blind nigger splittin' rails. But she's a daisy, Gener'l, as shore as you're born. She jess reads like straight along from cover to cover without a bobble. Why, sir, I never know'd what war was till I meandered through the sample pages of this book. And they've got your picture in here, Gener'l, jess as natural as life—all for five dollars, in cloth, eight in liberry style, and ten in morocker."

General Garwood glanced over the specimen pages with some degree of interest, while Goolsby continued to talk.

"Now, betwixt you and me, Gener'l," he went on confidentially, "I don't nigh like the style of that book, particular where it rattles up our side. I wa'n't in the war myself, but blame me if it don't rile me when I hear outsiders a-cussin' them that was. I come mighty nigh not takin' holt of it on that account, but 'twouldn't have done no good, not a bit. If sech a book is got to be circulated around here, it better be circulated by some good Southron—a man that's a kind of antidote to the pizen, as it were. If I don't sell it, some blamed Yankee 'll jump in and gallop around with it. And I tell you what, Gener'l, betwixt you and me and the gate-post, it's done come to that pass where a man can't afford to be too pledged particular; if he stops for to scratch his head and consider whether he's a gentleman, some other feller 'll jump in and snatch the rations right out of his mouth. That's why I'm a-paradin' around tryin' to sell this book."

"Well," said General Garwood in an encouraging tone, "I have no doubt it is a very interesting book. I have heard of it before. Fetch me a copy when you come to Azalia again."

Goolsby smiled an unctuous and knowing smile.

"Maybe you think I ain't a-comin'," he exclaimed, with the air of a man who has invented a joke that he relishes. "Well, sir, you're getting the wrong measure. I was down in 'Zalia Monday was a week, and I'm a-goin' down week after next. Fact is," continued Goolsby, rather sheepishly, "'Zalia is a mighty nice place. Gener'l, do you happen to know Miss Louisa Hornsby? Of course you do! Well, sir, you might go a week's journey in the wildwood, as the poet says, and not find a handsomer gal then that. She's got style from away back."

"Why, yes!" exclaimed the general in a tone of hearty congratulation, "of course I know Miss Lou. She is a most excellent young lady. And so the wind sits in that quarter? Your blushes, Goolsby, are a happy confirmation of many sweet and piquant rumors."

Goolsby appeared to be very much embarrassed. He moved about uneasily in his seat, searched in all his pockets for something or other that wasn't there, and made a vain effort to protest. He grew violently red in the face, and the vivid color gleamed through his closely cropped hair.

"Oh, come now, Gener'l!" he exclaimed. "Oh, pshaw! Why—oh, go 'way!"

His embarrassment was so great, and seemed to border so closely on epilepsy, that the general was induced to offer him a cigar and invite him into the smoking-apartment. As

General Garwood and Goolsby passed out, Helen Eustis drew a long breath.

"It is worth the trouble of a long journey to behold such a spectacle," she declared. Her aunt regarded her curiously. "Who would have thought it?" she went on. "A Southern secessionist charged with affability, and a book-agent radiant with embarrassment."

"He is a coarse, ridiculous creature," said Miss Tewksbury sharply.

"The affable general, Aunt Harriet?"

"No, child; the other."

"Dear aunt, we are in the enemy's country and we must ground our prejudices. The book-agent is pert and crude, but he is not coarse. A coarse man may be in love, but he would never blush over it. And as for the affable general—you saw the negro woman cry over him."

"Poor thing!" said Miss Tewksbury, with a sigh. "She sadly needs instruction."

"Ah, yes! that is a theory we should stand to, but how shall we instruct her to run and cry after us?"

"My dear child, we want no such disgusting exhibitions. It is enough if we do our duty by these unfortunates."

"But I do want just such an exhibition, Aunt Harriet," said Helen seriously. "I should be glad to have some fortunate or unfortunate creature run and cry after me."

"Well," said Miss Tewksbury placidly, "we are about to ignore the most impressive fact, after all."

"What is that, Aunt Harriet?"

"Why, child, these people are from Azalia, and for us Azalia is the center of the universe."

"Ah, don't pretend that you are not charmed, dear aunt. We shall have the pleasure of meeting the handsome Miss Hornsby, and probably Mr. Goolsby himself—and certainly the distinguished general."

"I only hope Ephraim Buxton has a clear conscience to-day," remarked Miss Tewksbury with unction.

"Did you observe the attitude of the general towards Mr. Goolsby, and that of Mr. Goolsby towards the general?" asked Helen, ignoring the allusion to Dr. Buxton. "The line that the general drew was visible to the naked eye. But Mr. Goolsby drew no line. He is friendly and familiar on principle. I was reminded of the 'Brookline Reporter,' which alluded the other day to the London 'Times' as its esteemed contemporary. The affable general is Mr. Goolsby's esteemed contemporary."

"My dear child," said Miss Tewksbury, somewhat anxiously, "I hope your queer conceits are not the result of your illness."

"No; they are the result of my surround-

ings. I have been trying to pretend to myself ever since we left Washington that we are travelling through a strange country, but it is a mere pretense. I have been trying to verify some previous impressions of barbarism and shittleness."

"Well, upon my word, my dear," exclaimed Miss Tewksbury, "I should think you had had ample opportunity."

"I have been trying to take the newspaper view," Helen went on with some degree of earnestness, "but it is impossible. We must correct the newspapers, Aunt Harriet, and make ourselves famous. Everything I have seen that is not to be traced to the result of the war belongs to a state of arrested development."

Miss Tewksbury was uncertain whether her niece was giving a new turn to her drollery, so she merely stared at her; but the young lady seemed to be serious enough.

"Don't interrupt me, Aunt Harriet. Give me the opportunity you would give to Dr. Barlow Blade, the trance medium. Everything I see in this country belongs to a state of arrested development, and it has been arrested at a most interesting point. It is picturesque. It is colonial. I am amazed that this fact has not been dwelt on by people who write about the South."

"The conservatism that prevents progress, or stands in the way of it, is a crime," said Miss Tewksbury, pressing her thin lips together firmly. She had once been on the platform in some of the little country towns of New England, and had made quite a reputation for pith and fluency.

"Ah, dear aunt, that sounds like an extract from a lecture. We can have progress in some things, but not in others. We have progressed in the matter of conveniences, comforts, and luxuries, but in what other directions? Are we any better than the people who lived in the days of Washington, Jefferson, and Madison? Is the standard of morality any higher now than it was in the days of the apostles?"

"Don't talk nonsense, Helen," said Miss Tewksbury. "We have a higher civilization than the apostles witnessed. Morality is progressive."

"Well," said Helen, with a sigh, "it is a pity these people have discarded shoe-buckles and knee-breeches."

"Your queer notions make me thirsty, child," said Miss Tewksbury, producing a silver cup from her satchel; "I must get a drink of water."

"Permit me, madame," said a sonorous voice behind them; and a tall gentleman seized the cup and bore it away.

"It is the distinguished general!" exclaimed Helen in a tragic whisper, "and he must have heard our speeches."

"I hope he took them down," said Miss Tewksbury snappishly. "He will esteem you as a sympathizer."

"Did I say anything ridiculous, Aunt Harriet?"

"Dear me! you must ask your distinguished general," replied Miss Tewksbury triumphantly.

General Garwood returned with the water and insisted on fetching more. Helen observed that he held his hat in his hand, and that his attitude was one of unstudied deference.

"The conductor tells me, madame," he said, addressing himself to Miss Tewksbury, "that you have tickets for Azalia. I am going in that direction myself, and I should be glad to be of any service to you. Azalia is a poor little place, but I like it well enough to live there. I suppose that is the reason the conductor told me of your tickets. He knew the information would be interesting."

"Thank you," said Miss Tewksbury with dignity.

"You are very kind," said Miss Eustis with a smile.

General Garwood made himself exceedingly agreeable. He pointed out the interesting places along the road, gave the ladies little bits of local history that were at least entertaining. In Atlanta, where there was a delay of a few hours, he drove them over the battle-fields, and by his graphic descriptions gave them a new idea of the heat and fury of war. In short, he made himself so agreeable in every way that Miss Tewksbury felt at liberty to challenge his opinions on various subjects. They had numberless little controversies about the rights and wrongs of the war, and the perplexing problems that grew out of its results. So far as Miss Tewksbury was concerned, she found General Garwood's large tolerances somewhat irritating, for it left her no excuse for the employment of her most effective arguments.

"Did you surrender your prejudices at Appomattox?" Miss Tewksbury asked him on one occasion.

"Oh, by no means; you remember we were allowed to retain our side-arms and our saddle-horses," he replied, laughing. "I still have my prejudices, but I trust they are more important than those I entertained in my youth. Certainly they are less uncomfortable."

"Well," said Miss Tewksbury, "you are still unrepentant, and that is more serious than any number of prejudices."

"There is nothing to repent of," said the general, smiling, a little sadly as Helen thought. "It has all passed away utterly. The best we

can do is that which seems right, and just, and necessary. My duty was as plain to me in 1861, when I was a boy of twenty, as it is to-day. It seemed to be my duty then to serve my State and section; my duty now seems to be to help good people everywhere to restore the Union and to heal the wounds of the war."

"I'm *very* glad to hear you say so," exclaimed Miss Tewksbury in a tone that made Helen shiver; "I was afraid it was quite otherwise. It seems to me that if I lived here, I should either hate the people who conquered me, or else the sin of slavery would weigh heavily on my conscience."

"I can appreciate that feeling, I think," said General Garwood, "but the American conscience is a very healthy one—not likely to succumb to influences that are mainly malarial in their nature; and even from your point of view some good can be found in American slavery."

"I have never found it," said Miss Tewksbury.

"You must admit that but for slavery the negroes who are here would be savages in Africa. As it is they have had the benefit of more than two hundred years' contact with the white race. If they are at all fitted for citizenship, the result is due to the civilizing influence of slavery. It seems to me that they are vastly better off as American citizens, even though they have endured the discipline of slavery, than they would be as savages in Africa."

Miss Tewksbury's eyes snapped. "Did this make slavery right?" she asked.

"Not at all," said the general, smiling at the lady's earnestness. "But at least it is something of an excuse for American slavery. It seems to be an evidence that providence had a hand in the whole unfortunate business."

But in spite of these discussions and controversies, the general made himself so thoroughly agreeable in every way, and was so thoughtful in his attentions, that by the time Helen and her aunt arrived at Azalia they were disposed to believe that he had placed them under many obligations, and they said so; but the general insisted that it was he who had been placed under obligations, and he declared it to be his intention to discharge a few of them as soon as the ladies found themselves comfortably settled in the little town to which Dr. Buxton had banished them.

III.

AZALIA was a small town, but it was a comparatively comfortable one. For years and years before the war it had been noted as the

meeting-place of the wagon-trains by means of which the planters transported their produce to market. It was on the highway that led from the cotton plantations of middle Georgia to the city of Augusta. It was also a stopping-place for the stage-coaches that carried the mails. Azalia was not a large town, even before the war, when, according to the testimony of the entire community, it was at its best, and it certainly had not improved any since the war. There was room for improvement, but no room for progress, because there was no necessity for progress. The people were contented. They were satisfied with things as they existed, though they had an honest, provincial faith in the good old times that were gone. They had but one regret,—that the railroad station, four miles away, had been named Azalia. It is true, the station consisted of a water-tank and a little pigeon-house where tickets were sold, but the people of Azalia proper felt that it was in the nature of an outrage to give so fine a name to so poor a place. They derived some satisfaction, however, from the fact that the world at large found it necessary to make a distinction between the two places. Azalia was called "Big Azalia," and the railroad station was known as "Little Azalia."

Away back in the forties, or perhaps even earlier, when there was some excitement in all parts of the country in regard to railroad building, one of Georgia's most famous orators had alluded in the legislature to Azalia as "the natural gateway of the commerce of the Empire State of the South." This fine phrase stuck in the memories of the people of Azalia and their posterity, and the passing traveler, since that day and time, has heard a good deal of it. There is no doubt that the figure was fairly applicable before the railways were built, for, as has been explained, Azalia was the meeting-place of the wagon-trains from all parts of the State in going to market. When the cotton-laden wagons met at Azalia they parted company no more until they had reached Augusta. The natural result of this was that Azalia, in one way and another, saw a good deal of life—much that was entertaining, and a good deal that was exciting. Another result was that the people had considerable practice in the art of hospitality; for it frequently happened that the comfortable tavern, which Azalia's commercial importance had made necessary at a very early period of the town's history, was full to overflowing with planters accompanying their wagons and lawyers traveling from court to court. At such times the worthy townspeople would come to the rescue, and offer the shelter of their homes to the belated wayfarer.

There was another feature of Azalia worthy of attention. It was in a measure the site and center of a mission—the headquarters, so to speak, of a very earnest and patient effort to infuse energy and ambition into that indescribable class of people known in that region as the piney-woods “tackies.” Within a stone’s throw of Azalia there was a scattering settlement of these tackies. They had settled there before the revolution, and had remained there ever since, unchanged and unchangeable, steeped in poverty of the most desolate description and living the narrowest lives possible in this great Republic. They had attracted the attention of the Rev. Arthur Hill, an Episcopalian minister, who conceived an idea that the squalid settlement near Azalia afforded a fine field for missionary labor. Mr. Hill established himself in Azalia, built and furnished a little church in the settlement, and entered on a career of the most earnest and persevering charity. To all appearances his labor was thrown away, but he was possessed by both faith and hope, and never allowed himself to be disheartened. All his time, as well as the modest fortune left him by his wife, who was dead, was devoted to the work of improving and elevating the tackies, and he never permitted himself to doubt for an instant that reasonable success was crowning his efforts. He was gentle, patient, and somewhat finical.

This was the neighborhood towards which Miss Eustis and her aunt had journeyed. Fortunately for these ladies, Major Haley, the genial tavern-keeper, had a habit of sending a hack to meet every train that stopped at Little Azalia. It was not a profitable habit in the long run, but Major Haley thought little of the profits so long as he was conscious that the casual traveler had abundant reason to be grateful to him. Major Haley himself was a native of Kentucky, but his wife was a Georgian, inheriting her thrift and her economy from a generation that knew more about the hand-loom, the spinning-wheel, and the cotton-cards than it did about the piano. She admired her husband, who was a large, fine-looking man, with jocular tendencies, but she disposed of his opinions without ceremony when they came in conflict with her own. Under these circumstances it was natural that she should have charge of the tavern and all that appertained thereto.

General Garwood, riding by from Little Azalia, whither his saddle-horse had been sent to meet him, had informed the major that two ladies from the North were coming in the hack, and begged him to make them as comfortable as possible. This information Major Haley dutifully carried to his wife.

“Good Lord!” exclaimed Mrs. Haley, “what do you reckon they want here?”

“I’ve been a-studyin’,” said her husband thoughtfully. “The gener’l says they’re comin’ fer their health.”

“Well, it’s a mighty fur cry for health,” said Mrs. Haley emphatically. “I’ve seen some monst’ous sick people around here; and if anybody ’ll look at them tackies out on the Ridge yonder, and then tell me there’s any health in this neighborhood, then I’ll give up. I don’t know how in the wide world we’ll fix up for ’em. That everlastin’ nigger went and made too much fire in the stove and tee-totally ruind my light-bread; I could ’a’ cried, I was so mad; and then on top er that the whole dinin’-room is tore up from top to bottom.”

“Well,” said the major, “we’ll try and make ’em comfortable, and if they ain’t comfortable it won’t be our fault. Jest you whirl in and put on some of your Greene county style, Maria. That’ll fetch ’em.”

“It may fetch ’em, but it won’t feed ’em,” said the practical Maria.

The result was that when Helen Eustis and her aunt became the guests of this poor little country tavern, they were not only agreeably disappointed as to their surroundings, but they were better pleased than they would have been at one of the most pretentious caravansaries. Hotel luxury is comfortable enough to those who make it a point to appreciate what they pay for; but the appointments of luxury can neither impart nor compensate for the lack of the atmosphere that mysteriously conveys some impression or reminiscence of home. In the case of Helen and her aunt, this impression was conveyed and confirmed by a quilt of curious pattern on one of the beds in their rooms.

“My dear,” said Miss Tewksbury, after making a critical examination, “your grandmother had just such a quilt as this. Yes, she had two. I remember the first one was quite a bone of contention between your mother and me, and so your grandmother made two. I declare,” Miss Tewksbury continued, with a sigh, “it quite carries me back to old times.”

“It is well made,” said Helen, giving the stitches a critical examination, “and the colors are perfectly matched. Really, this is something to think about, for it fits none of our theories. Perhaps, Aunt Harriet, we have accidentally discovered some of our long-lost relatives. It would be nice and original to substitute a beautiful quilt for the ordinary strawberry mark.”

“Well, the sight of it is comforting, anyhow,” said Miss Tewksbury, responding to the half-serious humor of her niece by pressing

her thin lips together and tossing her gray ringlets.

As she spoke, a negro boy, apparently about ten years old, stalked unceremoniously into the room, balancing a large stone pitcher on his head. His hands were tucked beneath his white apron, and the pitcher seemed to be in imminent danger of falling, but he smiled and showed his white teeth.

"I come fer ter fetch dish yer pitcher er water, ma'm. Miss 'Ria say she speck you lak fer have 'im right fresh from de well."

"Aren't you afraid you'll drop it?" said Miss Eustis.

"Lor,' no'm!" exclaimed the boy, emphasizing his words by increasing his grin. "I been ca'um dis away sence I ain't no bigger dan my li'l' buddy. Miss 'Ria, she say dat w'at make I so bow-legged."

"What is your name?" inquired Miss Tewksbury, with some degree of solemnity, as the boy deposited the pitcher on the wash-stand.

"Mammy, she say I un name Willum, but Mars Maje en de turrer folks, dey des calls me Bill. I run'd off en sot in de school-'ouse all day one day, but dat mus' 'a' been a mighty bad day, kaze I ain't never year um say wherrer I wuz name Willum, er wherrer I wuz des name Bill. Miss 'Ria, she say dat 'tain't make no diffunce w'at folks' name is, long ez day come w'en dey year turrer folks holl'in' at um."

"Don't you go to school, child?" Miss Tewksbury inquired, with dignified sympathy.

"I start in once," said William, laughing, "but mos' time I git dar de nigger man w'at do de teachin' tuck'n snatch de book out'n my han' en say I got 'im upper-side down. I tole 'im dat de onliest way w'at I kin git my lesson, en den dat nigger man tuck'n lam me side de head. Den atter school bin turn out, I is hide myse'f side de road, en w'en dat nigger man come 'long, I up wid a rock en I fetched 'im a clip dat mighty nigh double 'im up. You ain't never is year no nigger man holler lak dat nigger man. He run'd en tole Mars Peyt. dat de Kukluckers wuz atter 'im. Mars Peyt. he try ter quile 'im, but dat nigger man done gone!"

"Don't you think you did wrong to hit him?" Miss Tewksbury asked.

"Dat w'at Miss 'Ria say. She say I oughter be shame er myse'f by good rights; but w'at dat nigger man wanter come hurtin' my feelin' fer w'en I settin' dar studyin' my lesson des hard ez I kin, right spang out'n de book, en spozen she wuz upper-side down, wa'n't de lesson in dar all de time, kaze how she gwine spill out?"

William was very serious,—indeed, he was

indignant,—when he closed his argument. He turned to go out, but paused at the door and said:

"Miss 'Ria say supper be ready 'mos' 'fo' you kin turn 'roun', but she say ef you too tired out she'll have it sont up." William paused, rolled his eyes towards the ceiling, smacked his mouth, and added: "I gwine fetch in de batter-cakes myse'f!"

Miss Tewksbury felt in her soul that she ought to be horrified at this recital; but she was grateful that she was not amused.

"Aunt Harriet," cried Helen, when William had disappeared, "this is better than the sea-shore. I am stronger already. My only regret is that Henry P. Bassett, the novelist, is not here. The last time I saw him he was moping and complaining that his occupation was almost gone because he had exhausted all the types—that's what he calls them. He declared he would be compelled to take his old characters and give them a new outfit of emotions. Oh, if he were only here!"

"I hope you feel that you are in some sense responsible for all this, Helen," said Miss Tewksbury solemnly.

"Do you mean the journey, Aunt Harriet, or the little negro?"

"My dear child, don't pretend to misunderstand me. I cannot help feeling that if we had done and were doing our whole duty, this—this poor negro—Ah, well! it is useless to speak of it. We are on missionary ground, but our hands are tied. Oh, I wish Elizabeth Mappis were here! She would teach us our duty."

"She wouldn't teach me mine, Aunt Harriet," said Helen seriously. "I wouldn't give one grain of your common sense for all that Elizabeth Mappis has written and spoken. What have her wild theories to do with these people? She acts like a man in disguise. When I see her striding about delivering her harangues, I always imagine she is wearing a pair of cow-hide boots as a sort of stimulus to her masculinity. Ugh! I'm glad she isn't here."

Ordinarily, Miss Tewksbury would have defended Mrs. Elizabeth Mappis, but she remembered that a defense of that remarkable woman, as remarkable for her intellect as for her courage, was unnecessary at all times, and, in this instance, absolutely uncalled for. Moreover, the clangor of the supper-bell, which rang out at that moment, would have effectually drowned out whatever Miss Tewksbury might have chosen to say in behalf of Mrs. Mappis.

The bell-ringer was William, the genial little negro whose acquaintance the ladies had made, and he performed his duty with an unction that left nothing to be desired. The bell

was so large that William was compelled to use both hands in swinging it. He bore it from the dining room to the hall and thence from one veranda to the other, making fuss enough to convince everybody that those who ate at the tavern were on the point of enjoying another of the famous meals prepared under the supervision of Mrs. Haley.

There was nothing in the dining-room to invite the criticism of Helen and her aunt, even though they had been disposed to be critical; there was no evidence of slatternly management. Everything was plain, but neat. The ceiling was high and wide, and the walls were of dainty whiteness, relieved here and there by bracket-shelves containing shiny crockery and glass-ware. The oil-lamps gave a mellow light through the simple but unique paper shades with which they had been fitted. Above the table, which extended the length of the room, was suspended a series of large fans. These fans were connected by a cord, so that when it became necessary to cool the room, or to drive away the flies, one small negro, by pulling a string, could set them all in motion.

Over this dining-room Mrs. Haley presided. She sat at the head of the table, serene, cheerful, and watchful, anticipating the wants of each and every one who ate at the board. She invited Helen and her aunt to seats near her own, and somehow managed to convince them, veteran travelers though they were, that hospitality such as hers was richly worth paying for.

"I do hope you'll make out to be comfortable in this poor little neighborhood," she said, as the ladies lingered over their tea, after the other boarders—the clerks and the shop-keepers—had bolted their food and fare. "I have my hopes and I have my doubts. General Garwood says you're come to mend your health," she continued, regarding the ladies with the critical eye of one who has had something to do with herbs and simples, "and I've been tryin' my best to pick out which is the sick one, but it's a mighty hard matter. Yet I won't go by looks, because if folks looked bad every time they felt bad, they'd be some mighty peaked people in this world, off and on. William, run and fetch in some hot batter-cakes."

"I am the alleged invalid," said Helen. "I am the victim of a conspiracy between my aunt here and our family physician. Aunt Harriet, what do you suppose Dr. Buxton would say if he knew how comfortable we are at this moment? I dare say he would write a letter and order us off to some other point."

"My niece," said Miss Tewksbury, by way of explanation, "has weak lungs, but she has

never permitted herself to acknowledge the fact."

"Well, my goodness!" exclaimed Mrs. Haley, "if that's all, we'll have her well and sound in a little or no time. Why, when I was her age, I had a hackin' cough and a rackin' pain in my breast night and day, and I fell off till my own blood kin didn't know me. Everybody give me up, but old Miss Polly Flanders in Hancock, right j'inin' county from Greene, she sent me word to make me some mullein tea and drink sweet milk right fresh from the cow, and from that day to this I've never know'd what weak lungs was. I reckon you'll be mighty lonesome here," said Mrs. Haley, after William had returned with a fresh supply of batter-cakes, "but you'll find folks mighty neighborly, once you come to know 'em. And, bless goodness! here's one of 'em now. Howdy, Emma Jane?"

A tall, ungainly-looking woman stood in the door of the drawing-room leading to the kitchen. Her appearance showed the most abject poverty. Her dirty sun-bonnet had fallen back from her head and hung on her shoulders. Her hair was of a reddish-gray color, and its frazzled and tangled condition suggested that the woman had recently passed through a period of extreme excitement; but this suggestion was promptly corrected by the wonderful serenity of her face—a pale, unhealthy-looking face, with sunken eyes, high cheek-bones, and thin lips that seemed never to have troubled themselves to smile; a burnt-out face that had apparently surrendered to the past and had no hope for the future. The Puritan simplicity of the woman's dress made her seem taller than she really was, but this was the only illusion about her. Though her appearance was uncouth and ungainly, her manner was unembarrassed. She looked at Helen with some degree of interest, and to the latter it seemed that misery, hopeless but unabashed, gazed at her with a significance at once pathetic and appalling. In response to Mrs. Haley's salutation, the woman seated herself in the doorway and sighed.

"You must be tired, Emma Jane, not to say howdy," said Mrs. Haley, with a smile. The woman raised her right hand above her head and allowed it to drop helplessly into her lap.

"Ti-ud! Lordy, Lordy! how kin a pore creetur' like me be ti-ud? Hain't I thes natally made out'n i'on?"

"Well, I won't go so fur as to say that, Emma Jane," said Mrs. Haley, "but you're mighty tough. Now, you know that yourself."

"Yes'n—yes'n. I'm made out'n i'on. Lordy, Lordy! I thes natally hone fer some un ter come along an' tell me what makes me

h'ist up an' walk away over yan' ter the railroad track an' set thar tell the ingine shoves by. I wisht some un ud up an' tell me what makes me so restless an' oneasy, ef it hain't 'cause I'm hongry; I thes wisht they would. Passin' on by, I sez ter myself, s'I, 'Emma Jane Stucky,' s'I, 'ef you know what's good fer your wholesome,' s'I, 'you'll sneakin on Miss Haley, 'cause you'll feel better,' s'I, 'ef you don't no more'n tell 'er howdy,' s'I. Lordy, Lordy! I dunner what ud 'come er me ef I hadn't a bin made out'n i'on."

"Emma Jane," said Mrs. Haley, in the tone of one who is humoring a child, "these ladies are from the North."

"Yes'n," said the woman, glancing at Helen and her aunt with the faintest expression of pity, "yes'n, I hearn tell you had comp'ny. Hit's a mighty long ways fum this, the North, hain't it, Miss Haley — a long ways fuder'n Tennissy? Well, the Lord knows, I pity um fum the bottom of my heart, that I do — a-bein' such a long ways fum home."

"The North is ever so much further than Tennessee," said Helen pleasantly, almost unconsciously assuming the tone employed by Mrs. Haley; "but the weather is so very cold there that we have to run away sometimes."

"You're right, honey," said Mrs. Stucky, hugging herself with her long arms. "I wisht I could run away fum it myself. Ef I wa'n't made out'n i'on, I dunner how I'd stan' it. Lordy! when the win' sets in from the East hit in about runs me plum distracted. Hit kills lots an' lots er folks, but they hain't made out'n i'on like me."

While Mrs. Stucky was describing the vigorous constitution that had enabled her to survive in the face of various difficulties, and in spite of many mishaps, Mrs. Haley was engaged in making up a little parcel of victuals. This she handed to the woman.

"Thanky-do! thanky-do, ma'am! Me an' my son 'll set down an' wallop this up, an' say thanky-do all the time, an' atter we're done we'll wipe our mouves an' say thanky-do."

"I reckon you ladies 'll think we're mighty queer folks down here," said Mrs. Haley, with an air of apology, after Mrs. Stucky had retired, "but I declare I can't find it in my heart to treat that poor creetur' out of the way. I set and look at her sometimes, and I wish I may never budge if I don't come mighty nigh cryin'. She ain't hardly fittin' to live, and if she's fittin' to die, she's lots better off than the com-

mon run of folks. But she's mighty worry-some. She pesters melots mor'n I ever let on."

"The poor creature!" exclaimed Miss Tewksbury, "I am truly sorry for her — truly sorry."

"Ah! so am I," said Helen. "I propose to see more of her. I am interested in just such people."

"Well, ma'am," said Mrs. Haley dryly, "if you like sech folks, it's a thousand pities you've come here, for you'll git a doste of 'em. Yes'm, that you will; a doste of 'em that'll last you as long as you live, if you live to be one of the patrioks. And you nee'nter be sorry for Emma Jane Stucky, neither. Jest as you see her now, jesso she's been a-goin' on fer twenty year, an' jest as you see her now, jesso she's been a-lookin' ev'ry sence anybody around here has been a-knowin' her."

"Her history must be a pathetic one," said Miss Tewksbury with a sigh.

"Her what, ma'am?" asked Mrs. Haley.

"Her history, the story of her life," responded Miss Tewksbury. "I dare say it is very touching."

"Well, ma'am," said Mrs. Haley, "Emma Jane Stucky is like one of them there dead pines out there in the clearin'. If you had a stack of almanacs as high as a hoss-rack, you couldn't pick out the year she was young and sappy. She must 'a' started out as a light'd knot, and she's been a-gittin' tougher year in an' year out, till now she's tougher'n the toughest. No'm," continued Mrs. Haley, replying to an imaginary argument, "I ain't predijiced agin the poor creetur' — the Lord knows I ain't. If I was, no vittels would she git from me — not a scrimption."

"I never saw such an expression on a human countenance," said Helen. "Her eyes will haunt me as long as I live."

"Bless your soul and body, child!" exclaimed Mrs. Haley; "if you're going to let that poor creetur's looks pester you, you'll be worried to death, as certain as the world. There's a hunderd in this settlement jest like her, and ther' must be more'n that, old an' young, 'cause the children look to be as old as the'r grannies. I reckon maybe you ain't used to seein' piney-woods tackies. Well, ma'am, you wait till you come to know 'em, and if you are in the habits of bein' ha'nted by looks, you'll be the wuss ha'nted mortal in this land, 'less'n it's 'em that's got the sperrit-rappin's after 'em."

(To be continued.)

"NOTHIN' TO SAY."

ENGRAVED BY CHARLES STATE.

NOTHIN' TO SAY.

NOTHIN' to say, my daughter! Nothin' at all to say! —
Girls that's in love, I've noticed, ginerly has their way!
Yer mother did, afore you, when her folks objected to *me* —
Yit here *I* am, and here *you* air! and yer mother — where is she?

You look lots like yer mother: Purty much same in size;
And about the same complected; and favor about the eyes.
Like her, too, about *livin'* here, because *she* couldn't stay;
It'll 'most seem like you was dead like her! — but I hain't got nothin' to say!

She left you her little Bible — writ yer name acrost the page —
And left her ear-bobs fer you, ef ever you come of age.
I've allus kep' 'em and gyaured 'em, but ef yer agoin' away —
Nothin' to say, my daughter! Nothin' at all to say!

You don't rickollect her, I reckon? No; you wasn't a year old then!
And *now* yer — how old air you? Why, child, *not* "twenty!" When?
And yer nex' birthday's in Aprile? and you want to git married that day?
. . . I wisht yer mother was livin'! — but — I hain't got nothin' to say!

Twenty year! and as good a gyrl as parent ever found!
There's a straw ketched onto yer dress there — *I'll* bresh it off — turn round.
(Her mother was jest twenty when us two run away!)
Nothin' to say, my daughter! Nothin' at all to say!

James Whitcomb Riley.

OUR KIVIGTOK.

AN EPISODE OF THE LADY FRANKLIN BAY EXPEDITION.

His name was Jens Edwards, and he was an Inuit, that is to say, a man; for with more than Saxon pride the Eskimo has always claimed his own to be the race of the world. He was born in 1843. He died in his kayak at sea, as had his father before him. That he met his death while striving for game to feed his starving comrades, slowly dying on the bleak, barren bluff of Sabine, is why I tell you the story of his life, and how he was our Kivigtok.

The incidents of early years were gathered partly from his own words, but the general outlines came from my surgeon and from the Danish officials at Upernivik.

His birthplace was on the little island of Proven, one of the small outposts of the Royal Danish Trade, around which cluster the Eskimos of the West Greenland coast. The long arctic night, which at Proven is unbroken by

sun for over ten weeks, gives ample time for improvement; and beside a knowledge of printed text, the gentle Danish priest had taught Jens the doctrines of the catechism, and had attuned his voice to the fervent Eskimo hymns, weird chants of praise which seem very outbursts of the soul, and which make such a strong impression on European minds.

It may be that religious feeling is largely a part of the Eskimo nature, or perhaps that school and church are as much diversion as duty, and so are welcomed as glad and happy breaks in the monotony of continual darkness or eternal sunshine. In such manner, at all events, were the winters of Jens Edwards' childhood passed.

The lavish care and affection always shown by the Greenlanders to their children had been peculiarly his. His father rehearsed to him the old Inuit tales and traditions, which ever turned on those sports and labors that were to be the end and aim of his life, the

OUR LAST SIGHT OF THE "PROTEUS."

hunt of the bear and seal, and the journeys to the fabled inland country, habited by reindeer and conjurers. In early spring, when want came and famine threatened, he had with unbroken fast followed in stealthy tread his father from his sledge to the seal-net, and when skill and fortune gave a *Neitsik*, had learned how to flay deftly its skin and separate from the rich, dark meat the thick creamy layers of solid blubber, which with the hairy pelt could be bartered with the *Coloni-bestyrer* for scant supplies of bread and coffee.

In summer days, when plenty reigns and strength abides, when the polar sun for many weeks gives life and vigor to all nature, he had learned while yet a mere child the rudiments of *kayaking*.

This dangerous craft is gradually dying out in Greenland, and only the brighter and more ambitious boys acquire it. Practice must commence at a tender age, and must be continued assiduously. Jens had a pride and delight in the art, such as was unusual in his settlement. For those who have never seen a kayak I will imperfectly describe it as a shuttle-shaped boat, consisting of a wooden frame-work, which is fastened together generally by seal-skin thongs, and over which is stretched a

covering of tanned seal-skin as neatly and tightly as in the sheep-skin of a drum-head. The skin covering is so well tanned, and it is so deftly sewn together with sinew thread by the Eskimo women, that no drop of water finds its way through skin or seam. The use of seal thong in uniting the stanchions gives great strength and equal elasticity, allowing with impunity great shocks which otherwise would destroy so frail a structure. The boat is usually some fifteen feet long, and from its central point gently curves upward — from a width of twenty and a depth of ten inches — to pointed ends. Both prow and stern are carefully armed with a thin molding of walrus ivory, which is a protection to the skin covering when the hunter, spinning through the water, strikes small ice, or, in landing, so throws forward and upward his kayak that boat and man slide easily and safely up the edge on to the level surface of a floe. The only opening is a circular hole with a bone or wooden ring, its size being strictly limited to the circumference of the hips of the largest hunter who is to use it.

A waterproof combination jacket and mitten of oil-tanned seal-skin is worn by the hunter, who tightly laces the bottom to the

ing, so that no water can enter the kayak. Thus equipped, the Inuit hunter faces seas which would swamp any other craft, and plunges safely through the heaviest surf. A single oar, with a blade at each end, in skillful and framed hands propels this unballasted, unsteady craft with great rapidity, and it moves through the water at a rate varying from five to ten miles an hour, according to the character of the sea and the exigency of the occasion. The oar properly handled enables an expert to rise to the surface, if, as happens at times, the boat is overturned.

The kayak of the Eskimo is probably unsurpassed in ingenuity by the boating devices of any other savage people of the globe. Its essential points of lightness, buoyancy, and structural strength are marvelously well adapted to the varying and dangerous conditions under which an Eskimo provider seeks his sea game. This tiny craft with all hunting gear weighs scarcely 50 pounds, and will carry a load of some 200 pounds besides its occupant.

In a few short summers Jens became one of the most expert kayakers of his settlement, and as years rolled on he timidly passed from the quiet water of the adjoining inlet to the broader expanses of Salmon Fiord, and later boldly ventured in search of seal into the open sea, which beats, often with turbulent and furious force, against the battling crags stretching northward from Proven to meet the majestic cliff of Sanderson's Hope. Before he was fifteen, a proud and happy boy, he brought from the sea, trailing after his kayak, a seal caught by harpoon and bladder, and was received with feast and ceremony as a hunter among hunters. In such wise was he trained and grew to manhood, and it was known that a more active and clever youth could not be found in Proven. His obliging disposition and his expertness in various kinds of handicraft made him a useful man to the colony, and as an underworkman he could easily have had a place in the Royal Trade, the dream and crown of many a Greenlander's life. But Jens was made of better stuff. His father just then perished, as does many an Eskimo hunter, while chasing the seal in the treacherous waters and among the arctic ice of Baffin's Bay. It may be that, unable to turn his frail kayak in heavy seas and strong winds, he strove against them until he became completely exhausted, and the elements prevailed and he perished. Perchance, having struck a large seal or lanced a white whale, the excited hunter failed to throw the bladder, and with his kayak caught by the encircling coils of seal thong, was dragged to death by the game he had struck. At all events, the father, fasting, as do all good

hunters in Greenland when seeking the seal at sea, went forth and never returned.

Jens then determined to assume that place in the settlement which is upheld by force of custom as the most honorable for a Greenlander, and so became a provider.

This term in Greenland means that a man, to the best of his ability, shall follow the profession of a hunter in the sea, until physically disabled or succeeded by an able-bodied son. All Eskimos are land hunters, but hunting on the sea, from its great dangers, demands sound judgment, great physical strength, marked activity, and continuous practice. The death of his father, as it occurred at sea, was not without its influence as to his decision. It may be that in those children of the ice there is a touch of that same fatalism which is found among the sons of the desert, for in Greenland the son is bound to brave and defy the powers which have caused his father's death; and if in storm or ice that father has perished at sea, so much more the reason that the son by his skill as a kayaker should well acquit himself in the same calling. As years passed by, Jens took to himself a wife—not after the old Greenlandic fashion of infant betrothal and forced marriage, but by the Christian law which was more in keeping with his gentle spirit and early training.

In all these years he was the same helpful, industrious Jens who sought with earnest zeal to do his duty to his family and the village. No matter how late the spring, how early the autumn, or how hard the winter, his hut was never found without its oil or meat, brought from the sea by Jens's patient skill and unerring lance. When famine threatened in hard seasons, he of all never sought aid from the Trade. Only at such times he denied bread and coffee to his own, for his great, warm heart, touched by the misery around, gave to his starving fellows the blubber which would have bought these luxuries.

In these years he heard much of Hans Hendrik, who had written in Eskimo text his life, telling of his travels into the far north with Kane, Hayes, and Nares to lands where the inland ice was scarcely known, where reindeer were plentiful, and where even the musk-ox, the famous and traditional umimak, was to be found straying down to the sea from the fertile valleys of the interior.

These travels of Hans served long as winter talk for all Greenland, as in the gossip of its long arctic night is told and retold all that has been done or said in years throughout its thousand miles of inhabited coast. So the seed sown by his father's tales was fructified by the adventures of Hans. Then came to the country the forerunner of our

expedition, a skillful doctor, who spent much time with the natives, who learned to drive a dog-team, and like an Inuit ran after the sledge, who talked of the far north and promised game and adventures for Jens and good Danish coin for the family if he would go with him and his, the coming year. So it was that Jens Edwards, with tears in his eyes but courage in his heart, came one day to our little launch, in Proven, and, saying farewell to weeping wife and babes, sailed up the ice-bound coast to Upernivik and us.

As he came on board the *Proteus*, he stood before me a true Greenlander,— alert, active, and nimble in kayak or boat, in handling the oar, in throwing the lance, or using the gun; yet in other movements he showed that awkwardness which always comes in the use of untrained muscles. He was short, even for an Eskimo, being scarcely five feet in height. His complexion and general physiognomy struck me as distinctly Mongolian, of a shade between the Chinese and the Japanese. His coal-black hair was coarse and plentiful, and his black eyes were set in almond-shaped orifices. His face was broad and beardless, his nose flat, and his head very large, with neck short and thick. To a broad, full chest, stout arms and legs, were united small, well-formed hands and feet, the latter diminutive and shapely enough for a lady. He brought his fateful kayak and all needful weapons for sea-chase, which received his unceasing care and attention. His agreement bound him for duty as dog-driver and hunter and for such other cheerful service as I might exact, and in return he or his family was to receive twenty-five dollars in American gold each month. He was further to receive good and sufficient food and clothing, and in case of death in service I was to attempt to procure a pension for his family. He was pledged by the Royal Inspector to be honest, truthful, industrious, and faithful. I found him always busy and helpful, the most truthful being I have ever known, honest to the core, and faithful unto death.

So he sailed northward, and stood as one of us at Conger that eventful August day, watching the *Proteus*, as departing she forced her way slowly through the grinding pack and, vanishing from sight, left us isolated dwellers on the utmost verge of the world. The sun left us at Conger the middle of October, but the monotonous routine of arctic life had long before been entered on. The continued darkness, the utter solitude of external nature, the unvarying round of duties, the constant sight of the same faces and the sound of the same voices, had their effect on even the least impressionable man, and called for unusual strength of will to meet them undisturbed.

But to our emotional Eskimos the trial was greater. It is true they had from childhood undergone the hardships of an arctic winter, but in that northern hamlet of Proven, on the darkest day the noonday sun yet came within five degrees of the horizon, and gave such twilight as permitted regular labor and exercise at midday.

In early December Jens had varying spells of marked cheerfulness and of moody depression. At times he came to see and talk with me, a liberty I always encouraged, though it seemed to him a great one, from an idea, ever present in those simple minds, as to the exalted station of a governor or inspector. In plain, simple phrases, a quaint broken mixture of English and Eskimo, he talked of wife and children, whom he had left, who were so dear to his heart, so far from his sight. His wish to see, to know of them, was so strong that I repented at times of having ever offered the shining gold which influenced at least the Danish governor to favor his coming.

December 13th came, a dull morning, the sky hidden by dense masses of low, leaden clouds, which with the rising temperature gave sure signs of coming snow. The air, though fairly warm for Grinnell Land, at a temperature below zero thirty degrees, was yet raw and chilling, being full of little spiculæ of falling frost, which fast fills the beard, covers the face and eyebrows, and glues together the eyelids. At such times a faint breath of air is only needed to cover you, from chin to forehead, with a mask of ice, which thickens with incredible rapidity. The dry, cold air of yesterday, which, inhaled, excites the inner membranes like sparkling wine, had given place to-day to a moist, damp medium, which benumbed and stupefied, instead of vivifying. A taste of the coming storm, a mere glance at the leaden sky, had been quite enough for the officers on rising, and they quickly gathered around our cheerful oak table, whose bright silver and snowy linen gave some zest to our morning meal. As we somberly ate, for the hundredth time we looked askant at each other, and wondered if the pallid tint of yellowish white came from the bleaching, impending darkness, or from illness, and if our own was like to other faces.

We had hardly finished our meal when the orderly, Sergeant Brainard, knocked at the door and told me that Jens was gone.

"Gone where?" I asked.

"No one knows, sir, but Eskimo Frederik says he has gone."

I found that the cook had heard him rise and wash at seven o'clock, but no one had since seen him.

Sergeants Rice and Brainard were at once ordered to search for tracks near the house.

In order that no chance should fail, and before the general parties should start, the trail must be found. To that end I directed them, each with a man, to take torches, and going out a quarter of a mile, to separate and travel in opposite half circles until they met west of the stations or found Jens's footsteps. It all had gone at one time or in an ordinary manner, the faint trail would have been obscured, and could have been picked up only with great difficulty.

As it was, Sergeant Rice found triple tracks on the Dutch Island path, two of which were yet clear in the recent-fallen frost, and of a person traveling toward the straits. Following them, he found that one turned back, evidently the trail of Frederik, who had before looked for Jens, but who, being without torch or lantern, could not see the footprints. Rice, sending back word that the trail had been found, and requesting a dog-sledge, continued on the track, accompanied by Private Whistler, whose zeal had led him to go without orders or even proper clothing. The dog-sledge left at once, under charge of the surgeon, with Sergeant Brainard and Eskimo Frederik. Rice found a good road for about two miles,—the beaten track over the paleocrystic floes, which daily was trodden by us, and which somehow intuitively in the beginning had been marked out toward home and friends—to the sunny and much-loved south.

By the time Dutch Island was reached the flaming turpentine torch was nearly empty, and at the end of the beaten path, where Jens had turned to the tortuous, winding maze of tangled ice-foot, it cast its glaring light only long enough to show that our Eskimo had turned toward the north and darkness, rather than toward the south and Proven. The course to the northeast led to Cape Beechy, the nearest point to Greenland, and he doubtless thought some time and in some unknown way he might pass the wild waste of rough ice, and with the rising coast of his native land find too, through its magic inland country, his home and loved ones.

How should the trail be farther followed? To return for a lantern was to lose time and perhaps lose the man, who might even then be perishing from cold. To go on without light was almost impossible, for so utter the darkness, so dense the falling haze of frost, that even the active, quick-eyed Jens had often fallen in the good road. As they turned back it occurred to Rice that in his outer pocket was a bit of candle which at times he used when noting the tide, his daily duty.

Lighting the candle, they found the tracks and went slowly on, experiencing many a fall in the chaotic masses of rough broken ice. In

a mile's travel the candle was relighted a dozen times, and as Rice was about waiting for the sledge he got a bad fall, by which he discovered, to his dismay, that he had not only lost the candle but had also disabled his right arm.

While they were searching for the candle, the dog-sledge with fresh torches came up, and the surgeon, finding that Rice could walk, sent him back to the station under the care of the ill-clad Whistler.

The doctor hurried on after Brainard and the sledge, and finally, near St. Patrick Bay, the party overtook Jens walking moodily on, heeding no cries, and turning no glance backward until he was reached and touched. Even then he would not talk, but silently took what was offered and fell into his wonted place behind the upstanders, at the rear of the sledge. Jens had gone nearly a dozen miles before he was caught. Clothed only for the warm quarters he had left, he had gone into the darkness and cold bare-handed and without a taste of food, and now took, as "good the gods provided," the fur mittens and plain bread his captors had brought with them.

The march in, which would have been slow and tedious from the roughness of the ice alone, was prolonged by the failing torch, which drove them to shore, where the high land and steep cliff had to be followed to insure their safe return. It had been, to begin with, the darkest of our two months of sunless days, but to add to their trouble a thick snow commenced falling, blinding and delaying them further. By good fortune no wind came, or they would have perished to a man. Two hours or more steady work brought them to the grounded floebergs and broken ice-foot at Dutch Island, huge masses of polar ice, at first forced high on the shelving shore in compact shape, and then broken and twisted into endless confusion by the heavy tides. It was no easy task, in utter darkness and falling snow, to wind a way through yawning clefts, or to climb the crests which must be scaled to reach the inner harbor.

The island passed, they struck the beaten path, where the eager dogs, with keen instinct keeping the trail on their wonted road, took up their best pace for home.

The station was but a scant half-mile distant, when loud calls from the side of the road caused a halt. It seemed that Rice, under Whistler's charge, had made slow progress homeward, and that after a time Whistler had begun talking extravagantly. At first Rice thought it was done to distract his mind from pain and to lessen the distance of travel. Soon, however, he found that Whistler was light-headed, a state evidently resulting from the extremely benumbing influence of the damp,

chilly air. Whistler had left the station too thinly clad, without orders, having been animated by excessive zeal for the search, which he did not realize would entail so long an absence. Rice soon found that in place of having help from Whistler he must extend aid to him. Suffering great pain from his shoulder and entirely unable to use one arm, he hardly knew what course to pursue. It had commenced snowing, and he felt if he left Whistler and made his way for help to the station, the man would wander from the way, and certainly perish before help could come. By coaxing and by force, now asking aid which Whistler could not give but which would keep him by his side, and again sharply ordering him to move on when he inclined to stop and stray, Rice managed to bring him within a mile of the station. From that point he could get him along only by pushing and pulling, and with great difficulty could he restrain him from rushing wildly into the outer rough ice, which lined the road.

The doctor and Brainard soon brought the freezing man to the sledge, and were placing him on it, when Jens's brooding heart, which had driven himself out into darkness and death, was moved by a touch of nature, and he at once said, "If he rides, he freezes; he must run behind the sledge."

Only this speech came from his lips during his inward journey, and his wise advice brought Whistler safely to the house, though wild in words and actions, and numb near to death. Eager hands took off the stiff garments, melted the masses of ice which bound fast beard and hair, and chafed the chilled limbs till new life and vigor filled his veins. Rice's shoulder was soon cared for, a bad sprain, but no fracture, being found on examination.

As soon as quiet and order were restored, I at once had Jens brought to my room. It seemed to me that in dealing with a savage, simple nature it was well to avoid delay, which could but end in bad results by giving him time to conjure up false ideas as to what harm would come to him. I had no idea of using threats or blame. The affair had already given much physical pain to two of my men, temporarily disabling both and nearly causing the death of one; but what was that to a man who deliberately turned his back on light, warmth, plenty, and comfort, to risk darkness, cold, want, and death?

I had known how Eskimo Peter had left Hayes, and, wandering from his brig in Foulke Fiord, had perished near the inland ice along the barren shores of Prudhoe Land. The tricks of wily Hans Hendrik were then thought to have caused this desertion, marked by fatal results.

The same Hans, a dog-driver of Captain

Stephenson's, in our very harbor had gone forth to quit his party; but, as he said, not to give pain to his good captain, he dug a hole in the snow a short mile from the ship and let himself be found.

The harsh treatment which Peter feared and Hans feigned to fear could not be in question with us. Jens and his fellow had been treated with great kindness and marked consideration. Mindful of the advice given by the Royal Inspector of North Greenland, I had charged all the men to avoid any jesting or even the semblance of fun with these Eskimos, but to try and show that naught save gentle words and kind thoughts could come from us to them. These orders the men had rigidly obeyed.

I allowed no one to remain in the room with us, so as to spare Jens's feelings, and in the hope that being man to man I might thus the better gain his heart and confidence.

I gave him a glass of brandy—the great favor in Greenland, where *schnapps* cannot be sold to the natives. He drank it, as by order from the "Governor." I gave him some figs—a great delicacy among Greenlanders: he did not wish to take them. Tears sprang to his eyes as he told me he was bad and I was good, and he asked me to take them again. He at length ate one or two, after his simple, hearty, "dank you," which he had ever used as an acknowledgment of the least favor.

Slowly could I draw from him any word as to why he had gone, as to what of good could come to him, and what other than harm to us who had ever done that which was right and good to him and his. I gained little from him that day other than that he sought the inland country of Greenland and wanted to be a Kivigtok.

Day by day he visited me, coming always when I was alone, seating himself in his humble, timid, deprecating way, and telling me in a touching, hesitating manner of his home and wishes, of his wife and tiny babes, on the little island far to the south, whom he was destined never again to see. In the mean time I, fearful of another flight, had put a quiet guard over him by telling the hourly observers to ask his aid always when he was not at the table or in his bed. He was always glad to do a favor, and in this way his whereabouts was known hourly. I had learned, too, from Crantz and Rink what a Kivigtok was.

Among the beliefs germane to Greenlanders is one which a century and a half of christianizing influences has been unable to eradicate. The cause of this failure is not far to find, for in this civilized country of ours exists a similar belief, which is openly admitted by some, and a strain of which is to be found in nearly all—that of clairvoyance. This sense the Eskimos usually call *na-lus-sa-er-u-nek*, and

the individual possessing it is called *ur ho-vi-va-va-va*, which signifies that there exists nothing at which the possessor is not conscious. This gift, through an intuitive knowledge of nature's hidden laws, enables them to accomplish their will by methods unknown to common hands.

A Kivigtok is a man who has fled mankind and through a solitary life amid nature's surroundings has acquired this gift of clairvoyance,—learned to understand the speech of birds and animals, and acquired information as to the land and men of the world. Men usually become Kivigtoks owing to a just treatment by others or owing to a tongue lashing by kindred or home-mates which leads them to desire revenge. As Jens had no fear of us nor any fault with his treatment, I could not think the usual process could be identical with that which drove him away, and after a time my idea was confirmed.

It seemed that the simple, natural man did not—as indeed who of us does?—know himself. He came north, not so much that he might keep the wolf from his humble door as that he might have a glimpse of that beautiful country which his father had told him could be found inland, where reindeer and musk-oxen were plentiful, where meat and skins were in abundance, and the willow and the birch grew to giant trees. He had never before left wife or child for more than a few short days, and he knew not how strongly entwined around his heart were the tendrils of love which bound him to them. The going of the ship had in a way awakened him, but an active life, running after the sledge or hunting game, had saved him from himself until the long arctic night with little work and idle hours had given him time for thought and caused in his heart irrepressible longings.

Twenty years earlier, in the days of the great war, I had seen cold, stern men from the hard, harsh north, who blanched not in battle's heat, feared no foe, and stood at no fatigue, in strange wise waste slowly away, falling sick unto death for lack of face and voice that had been left behind in their burning zeal for our country's cause. In a manner it seemed wonderful then, but to see this child of the ice thus pine away was a new revelation to me. Savage or civilized, Eskimo or Caucasian, in arctic snows or torrid sands, where Love's true flame has once burned the heart ever yields obedience to its master touch.

But as to his reason for choosing this way of returning home, as to what end he hoped to gain by seeking cold and darkness, hunger and desolation, I did not at that time know. The cause was learned later from a narration of one bright experience of his tender years

that he recalled with great delight. The episode had made a deep impression on him not only through the pleasure of that season, but from its after-effect upon his mind and heart. The dull life of a hard, arctic winter always gives way to a certain joy and merriment as the sun comes north, and Nature replaces by a garb of green her winter shroud of white.

The providers of Proven, among whom Jens's father stood high, found it good that they should go that spring into the adjoining fiord to hunt reindeer. The skilful women of the hamlet had done their best with needle and sinew, with thong and skin, so that the *umiaks*, or women's boats, were stanch and water-tight. The tents and household goods were duly collected and piled into large boats. The old people and young children, exempt from hard work, arranged themselves comfortably between the benches, while the young women, lusty and strong, plied busily their oars and followed at a more leisurely pace after the slender kayaks, which far in advance skimmed over the calm waters of the inlet with great speed.

The fiord, at first open to the sea, by a gentle curve changed into a broad land-locked sheet of smooth water, studded with small isles. Its gray crags rose as sheer precipices on each side, fringed and bordered with banks and drifts of the winter's snow. Far away to the eastward the vanishing point of the steep cliffs seemed ever to meet the blue waters, but as they rowed on the bordering land on each side yet rose abrupt and stern. At places, as they passed along, the air resounded with screams and cries of wild sea-fowl that nesting on the high ledges resented this intrusion on their native haunts. As the midnight sun, in its circling course, just dipped to kiss the sharp, gray crest of the barren crags, there rose far to the southeast, illumined by its rays, a faint white line which severed the blue of the sky from its sister color of the sea. It was the first glimpse of the inland ice, that mysterious barrier which the old men said stood only between the hard barren peninsula of Svarte Huk and the land of the Inlanders, the *Tuneks* and the mountain elves.

With Innuït patience they rowed on, and a few hours later pitched their seal-skin tents on the shelving ground which led up from the sea into the inland valleys. Here, to Jens's delight, he saw the famous green trees of which he had heard,—dense copses of willow as thick as his thumb and as high as his head. If nature has denied fair woodlands and green trees to Greenland, and contents herself with casting scant stores of dead drift-wood along its rocky shores, none the less has God implanted in the Innuït strong feelings of delight and pleasure in the tiny shrubs which form its native forests.

Their summer encampment was made beside the clear, cold stream which winter and summer flows from the glacier's front down to the fiord. The main valley was a finely sheltered one, and in many places willow copses were sufficiently abundant to afford ample fuel for cooking their simple repast.

The upturned umiaks, supported at either end by low rock walls, sheltered some of the party, while others were better provided with skin tents, which, stretched over poles, were kept in place by large stones rolled on the outer edge of the tent itself.

These tents were pitched on the same spot, and were secured by the same lichen-covered stones as had been those of their ancestors for many ages. And of one circle Jens's father said to him, "Here my father and my father's father have stood up their tents, as now I place mine." For many weeks these summer tents stood near the head of the fiord, serving as a general encampment. In small parties the hunters, with women and boys, took long journeys into the deep, extensive valleys, up toward the inland ice and westward into Svarte Huk Peninsula. Scant luggage had they, only such as was needful to secure and dress the game. The glacial lakes and streams gave water, and when reindeer failed, an occasional ptarmigan served as food, or under dire stress of hunger the arctic hare was eaten.

When good fortune came and one or more deer were killed, camp was at once made at the first fit place, until hunger was satisfied and rest enjoyed. The women with their skuning-knives soon separated the hide from the meat. Some stretched deftly out the raw hides, that they might be scraped and thus quickly dry in the constant sun, while others gathered scanty fuel from the nearest copses, and soon over a cheery fire their slices of reindeer meat were broiling on flat, heated stones, which answered equally for cooking and serving dishes.

When all were filled with food the pipe came forth, solace to savage as to civilized men, and then were told tales of the reindeer and seal hunt, and traditions of the fair inland country peopled by wizards. When the hour for sleep came a pile of rocks broke the wind which swept downward from the ice to the sea, and with no shelter but the sky they slept until well rested for the next day's hunt. The morrow saw the men and boys searching other valleys, while the patient women, broad belt over forehead, carried large loads of meat and skin to their summer camp.

One day they followed up a broad valley which reached to the very edge of the inland

ice. On each side the gentle slopes of green led up to high, precipitous crags, inaccessible to man or beast. At the head of the valley a projecting spur of the glacial ice-cap rose, a sheer wall of solid ice, hundreds of feet above a fertile nook of grass, mosses, and willows, where a herd of reindeer was feeding. Hemmed in by crag and ice, the whole band fell into their hands. The hunters had walked far, and throwing up a low wall of sod and stones, they camped by their game. The glacial brooks gave purest water, and dead bits of willow mixed with dry turf served for fuel. Their simple meal soon done, they lay down, warm and content, on the fresh reindeer skins, under the shadow of the towering ice cliffs. To the sky above them, like a frozen Niagara, rose the glacial front, a sheer precipice of opaque white marked only in spots with a delicate rosy tinge. Its snowy purity was greatly intensified, as one looked upward, by the bright sunlight, and by its contrast with the perfect blue of the arching sky.

At the glacier's base five small streams, one from a deep cave of cobalt blue, bubbled forth, finding their way over the piles of polished stones and through the masses of reddish moss and green turf plowed up by the advancing ice. Then Jens's father talked with them of the inland ice and the country beyond.

"When my father was a boy," he said, "where now yonder solid wall of ice rises high above us was a fertile valley. Leading far to the south over a gentle slope, it united to the great broad vale which leads down to the sea and looks on the fiord of Omenak where the neitsik leaps and white whales sport and play. Other green valleys stretched to this one from the east, through which the fat reindeer in our long summer day came down from the fair inland country to snuff the air of the sea and taste its brine. Here in those days of yore from far and near the Innuits came for game, and the hunters of Proven and Omenak, from southern and northern fiords, met there in a friendly way. Where then a hundred reindeer roamed, we search in vain for one."

"But how is it," said Jens, "that this broad valley has been filled in and covered with these mountains of ice, which cut us off from the eastern vales and southern seas?"

"It is that Tornarsuk* wanted these green valleys as pasture for the reindeer and great umimak (musk-ox), fit game for his friends."

"But there is naught here save snow and ice," answered Jens. "The deer and umimak cannot feed on ice."

"You see only the outer wall, and not the inner valleys," said his father. "This lofty

* The Supreme Being of the ancient Greenlanders was Tornarsuk, but after the advent of Christianity

he was degraded to the position of devil. Many yet cling secretly to the old belief.

ice is but a narrow barrier which separates the fertile hunting grounds from our barren peninsula. When Tornarsuk needs more ground he spreads outward this inland ice, leaving the fertile valleys behind it, where man and food his game." * What Tornarsuk once takes never comes back to us. The reindeer long since were of the coast, but now they stay in these valleys, and those we kill are only small bands which stray downward through the ice fields. As now the umimak, so in time the reindeer will be his, and to us at last will remain only the barren coast and the ice set with its game. To his friends those good things, to us that which remains."

"And who are his friends?" said the boy.

"Since remote ages, from Innuut father to son, has been handed down this legend,—and as my father told it to me, so I tell it again to you,—that whosoever boldly lays down his goods and weapons and bravely turning his back on the outer world flees fasting into waste and desert places, to him as a friend shall Tornarsuk come. He shall become a Kivigtok. The strongest bear, the largest whale, the most ferocious walrus shall fall victim to his force. The reindeer shall not distance him in speed, and even the great umimak that once roamed over these valleys shall fall an easy prey to him. He shall swim like the seal, he shall run as the deer, he shall climb as the umimak, and no harm shall come to him. He shall live to such age that even a Greenlander cannot count the generations which shall come and go in his time. And more, he shall know all things both on sea and land, in the fair inland country and on the barren coast. He shall know the speech of birds, and beast, and fish, and that which they can do he also shall be able to do. And the coming and going of his enemy he shall know, so that he can scare the seal which he would strike or the deer he would shoot. That which he can do against his enemy, the same can he do for his friend. But to see these wonders, to have these powers, it is needful with brave heart, telling none and speaking no word, for the Innuut hunter to go forth fasting and fearing not. In this way only can one be a Kivigtok."

All too soon for young Jens the sun sank at midnight below the level sky, and with coming darkness and cold the return to home and Proven was begun. The heavy loads of dried meat and skins of the slaughtered deer were packed by the women at the encampment,

* This idea of grassy valleys within the precincts of the inland ice and frequented by reindeer, has not only taken firm hold on the Eskimo mind, but has been advocated by distinguished men. Nordenskiöld, in his remarkable surveys over the inland ice, hoped to find such spots. The theory was first advanced, I

and the umiaks, carefully examined, were once more launched and loaded. Two days later the deeply laden boats were drawn up on the island rocks amid yelping dogs and excited natives, who crowded around to welcome the hunters and learn what game had come to Proven and them. The reindeer hunt was ended, but never did the youth forget the green ravines with willow copses, the fertile valleys, and the active deer, and then sprang up in his heart a growing longing to look beyond the edge of the shining ice into the beautiful inland country and its fabled people. So my simple-hearted native had hoped to reach the inland country and become a Kivigtok, sacrificing himself that his heart might be made glad by visions of wife and babes, whom he so longed for.

As soon as a knowledge of the real grief came to me, I told him he should go to wife and babes, but it would be better to wait the sun and a ship than to try again the perilous way across ice and snow, in cold and darkness. Though I had rightful claim to a service of two years, yet I would send him to Proven by the coming ship.

The slow days came and went, and he was again bright, cheery, and busy, and long before the returning sun gave a crimson color at noon to the southern sky, he was roaming over the snow-clad hills, hunting the arctic hare and the snowy ptarmigan.

March and the sun came to us together in that arctic land, and life and work were ours anew. It was then Jens's lot to go northward and strive to force a way through and over that ancient ice which covers the Polar Sea, and holds within it, well guarded, the secrets of the utmost north.

In the great danger which came there to his party, when, adrift on a floating pack in the Polar Sea, a fierce storm drove them northward, he was cool, calm, and helpful. But once he saw a curious neitsik raising his head above the water. He ran to the edge of the ice, and, calling the pet name "Poosie, Poosie," stood trembling with tears in his eyes till the seal sank. The common seal of Proven, it recalled to him in that dark hour his distant wife and children.

The ensuing year passed quickly and pleasantly at Conger. In quarters amiable, docile, and obliging, he was as sociable as his broken English would permit, and made himself a general favorite. He was always ready for all field-work, whether far or near. His rifle was his constant companion, and many a musk-ox, believe, by Mr. Whympers some twenty years since. My own discoveries of such valleys in Grinnell Land show the probability of similar places in Greenland, at points where the physical conditions are favorable, say in the great fiords of the east coast.

seal, or hare came to us as the fruit of his chase. He delighted to slay the musk-ox, the famous umimak, extinct in Danish Greenland, but the more talked of that it lives only in tradition.

The missing ship of the second year gave him no apparent uneasiness. Although he had counted on its coming and his going, his face showed no sorrow as it failed to come. That he remained so quietly and contentedly would have seemed ominous to me, had not my faith in him rested on a sure and sound basis. He had said to me that he would wait the coming of the ship, and his word once given, his actions were beyond the shadow of a doubt. When once he had promised to bide the time, his great loyalty to truth and duty bade him never to show by face or feature that he repented his word. With us at Conger he watched and waited for a ship already at the bottom of the sea. The hour of our retreat came, and we struggled fully four hundred miles along that barren, desolate coast. To-day the fierce north wind, massing the heavy pack, drove us to shore; to-morrow the strong southwest gale made a narrow lane for our passage, in which contending floes, crowding, made movement perilous; fog stopped, and fast-forming ice embayed; strong currents and heavy tides alternately beached us or dashed our boats, caught in the pitiless pack, against the dangerous ice-foot. But still we strove on, facing all, enduring all, overcoming all.

At last we reached Cape Hawks, and from the opposing headland, looking southward to Sabine, saw alternate floes and wide water lanes affording easy passage for any arctic ship. Then doubts and fateful forebodings came to us, but none the less we pressed on.

Another day saw us beset, fast bound by heavy floes cemented by new ice. In due time, dropping useless gear, with boat and sledge we tried the southern shore. Vain effort, for when by patient toil and great dangers we were at the very shore, the heavy gales, as if in mockery of man's power, drove us again and again far seaward. For over thirty days we struggled over the floating pack before persistent efforts landed us with scant food upon a rocky headland.

During all this trying season our Kivigtok was always cheerful, ever ready with oar or pike, with gun or kayak, to do that which he could. On ancient floes his sounding-pike always found the ice which, cut through, gave needful water from the lakes. On our darkest days his patient efforts with gun and kayak brought many pounds of meat to strengthen and encourage us.

Through the dreary autumn, ill-fed and shivering with cold, he and his fellow-native,

with Long, our hunter, spent long, cheerless days of feeble arctic twilight watching and hunting the seal which might save us. He was the same brave Jens through the terrible arctic night when for over five months no ray of sun entered our wretched hut. On Christmas day, when others sang songs of praise, he too raised his voice in an Eskimo hymn, learned in his boyhood days from the good priest. When, after five days' travel through storm and cold and darkness, he and Rice were driven exhausted back from the icy channel that cut them off from the eastern shore, for the first time his heart failed and courage deserted him. But with rest, again came hope and courage, and he followed the daily, but too often fruitless, hunt. What if with growing bodily weakness his hand trembled, knowing that a score of lives depended on his aim? His was the ball which checked at the water's edge the polar bear till Long's unerring aim sent a bullet through his head. When later, scarce able to walk, he missed the *oo-sook*, he feebly said his heart was broken. Yet still he hunted, and with a bright smile he knelt by me that eventful morn, and clasping my hand warmly said with gentle voice, "Good-bye, commander! I will do the best I can."

A thousand times they had looked out across those barren floes, across that icy sea for food and help, and a thousand times had they been disappointed. Now both Jens and Long called out *oo-sook* at the same moment, for far out on a floe, slow-moving to the south, lay a huge mass, the bearded seal of Greenland. He was basking on the floe in the bright sunlight. The seal's slumber broke now and then, and he raised his head with a quick, startled look, which died slowly away as he fell again into his troubled sleep. For a long time the two men, — Caucasian and Innuít, — well concealed behind a hummock, patiently watched the sleeping seal on the drifting floe, which between tides and currents took a devious course. Again and again it seemed about touching the outer fringe of slush and young ice, so that the hunters could reach the floe and secure the game. This was the safe, indeed the only prudent course. At last the floe seemed to be starting south, and Jens's patient prudence was ended. He would try the kayak. It was dangerous beyond doubt. Young ice abounded, and its touch meant death.

If his father perished at sea, was it not by storm and stress of weather? Why should he fear, with this calm, smooth water, this blue sky, and the bright sunlight? Had he not risked young ice before, — was he not a kayaker, an Innuít, and a provider? Were not his comrades starving and dying a few scant miles to the westward, and had he not told the com-

OUR KIVIGTOK.

mander that he would do his best? The oo-sook meant life and health for them all, those starving men, who, if not Innuits, might well be so. If Sergeant Long thought best not, it was that Long, though a hunter, was no kayaker. He would go, and his comrades should be saved. Deftly and noiselessly the kayak was launched, and skillfully he seated himself in the frail craft. The first pool was passed, the first floe gained, and, as silently he drew up his

kayak, he turned and smiling waved a farewell message to his comrade, the white hunter, who stood anxious and silent marking his progress.

With equal skill he again launched the kayak, and a few strokes carried him within a few rods of the longed-for floe. But suddenly the prow sinks and the stern rises — the fatal ice cuts the skin! In vain he plies the double-ended oar, for the filled kayak springs forward

only to turn and sink with its inert hunter, within a dozen yards of life and safety.

The sun shone yet brightly, the smooth waters sparkled, the seal slipped into the sea, and then — the only sign of life to the white

hunter was a dusky raven, which silently and swiftly sped toward Sabine.

The sea had claimed its own, and as his father before him, so went to rest and peace the Innuît, our Kivigtok.

A. W. Greely.

NOTES OF A PROFESSIONAL EXILE.

It surprises Americans to see how youthful men of advanced years often are in Europe. It is not uncommon to find two or three generations of beaux who are to every intent and purpose contemporaries.

There is here at this time a handsome young gentleman; his father, Lord R——, a brilliant person, also handsome; and his grandfather, who is not disposed to hide his light under a bushel. It puts one in mind of the state of society described in the Old Testament when Lamech, Cush, Phut, and Ramah were about the world at the same time. Cush, in this case Lord R——, is at the Springs at eight in the morning, dressed very bravely and floridly, bunching the girls, and walking the length of the shaded avenue with one or another pretty woman full of gay laughter and conversation. He is much more bent on amusement than either of his contemporaries, Phut, his son, or Lamech, his father.

But I have just met with the most extreme instance that I have ever known of a sprightly man of advanced years. I should not have expected such an exhibition would have been pleasant, but it was truly delightful. It was at tea with my English friends across the street. I observed in the corner an old gentleman whom I heard say to somebody—in jest, as it afterward appeared—that he was sixty-five. He looked older. He was presently made to sing a song. It was about the light that is in woman's eyes. He seemed to know all about these eyes, and to have been himself a considerable sufferer from their ravages. He sang with an uncertain quaver, but with a vivacity of expression truly surprising, in which was apparent his exultation in his present freedom from this source of disturbance, together with a lively appreciation of the enthrallment and subjection of the rest of us. I said, "That is an uncommonly sprightly man of sixty-five." They told me he was ninety. It was a novel and delightful performance. He addressed himself personally to the males who had been asked to this tea, shaking his head with a rather dreadful vivacity, and with a rollicking humor warbling at us his convic-

tion that the light above mentioned would be our "undo-o-ing."

... Some friends who have lived a great deal in France have an apartment in the Louisen Strasse. One sits about so much here in gardens and on piazzas, having coffee and listening to music, that one is rather bored with outdoors, and is surprised to find how pleasant it is to be inclosed by four walls and a ceiling. I feel as if I had just discovered what nice things lamps are. But the drawing-room of these friends of mine would be a particularly attractive one anywhere; it has the bright hospitality of good society on the continent; it is easy to fall into, and hard to keep out of.

They are Americans, of a family which has performed for the callow infancy of our giant State much honorable service. But they live very little in America; they prefer France. Their daughter, a convent-bred young thing, has scarcely even seen America. She is elegant, hoiden, and charming. She asks if you will have tea. You say "No," with the decision of a man who has little confidence in his firmness of purpose. To which she answers: "Well, don't be cross!" and, running to the sideboard, returns, and (with her dog under her arm) holds out some bonbons, and tells you to take such a one. She then resumes some piece of superior needlework, at which she is evidently clever. She is on terms of perfect equality with her mother, of whom she seems the younger sister, and appropriates the larger share of the talk, running on all the while with pert sallies. Her opinions, which are shrewd and sound enough, she advances smartly. She has an attractive figure. But what pleases you most about her is that she is so completely a product of the old world, and has to such a degree the impress of the elegant and perfect life of good society on the continent. She is the child of the convent, and has caught from her little playmates the essence of their young natures. And yet, I believe that the success she will no doubt have at home (the family are on their way to America) will be for her pretty face rather than her fine manners. My impression is that the graces communicated by the best European society are not appreciated, or are, at any rate, overlooked in the United States. One might have thought that the rarity of these qualities would

have given distinction to the persons possessing them. But I believe this not to be the case. Masters, no matter how fine, must exist in a social mass to be familiar to society at large before they will be admired.

This young girl's especial pet is just now a monkey, which I usually find sitting on its young mistress's lap. It is of a very small species, but its little face, scarcely larger than a half-dollar, is full of thought and expression. Its eyes are very bright and active. You may sit and see it reflect, which it does most obviously. The quality of its thought seems to be a lively melancholy. This is its habitual state of mind; its eyes send continually gleams of a vivacious sadness. It will now and then jump from its perch, and abruptly and in an inconsequent manner seize Fido's tail, which it will as abruptly let go to resume its place and pursue, upon Miss Emily's knee, the thread of its reflections. Did we, I wonder, sit upon a bough some millions of years ago thinking such sad thoughts?

The sitting-room they have given me here is certainly not dear, from the English or American point of view. It is good-sized, plainly but freshly and agreeably furnished, and always clean and neatly kept. It opens upon a well-cared-for flower-garden, filled with the common German flowers, acaules, stock-gillies, anemones, primroses, and has beyond the Zweibak lawns and foliage. When I come into it in the morning for breakfast, I find it full of light and sweet air, which are novelties to those whose spring and winter have been passed in town lodgings. It is sufficiently retired, and yet within easy call of people whom I see passing in the street which divides my flower-plots from the Kurhaus gardens; some of whom, more sociable than the rest, look in at my windows for a word or two, but do not stop to pay me a visit. I try to fill my mornings with reading or writing, and thus give the day a little substance and character.

Yesterday morning I took with me a translation of Dante's *Purgatory*, to read in the prettily wooded gardens back of the Kurhaus. I came upon the two young daughters of a French family staying here. This family, I am told, is very ancient; their name is that of one of the most interesting characters in the *Purgatory*. I asked the girls whether they supposed they were related to this personage. They said they did not know. The indifference which people in Europe often show to these matters is surprising to Americans, but is natural. I do not doubt it is the same family: the people are from the part of France to which the man mentioned by Dante belonged. The young ladies were interested enough, however, when the conversation turned upon the gossip of the place, engagements, and the like. It was

a striking association, that of "the mount that rises highest o'er the wave," and of the five hundred years which have elapsed since the poet went thither with Virgil, with these misses in bright print gowns among the pretty shades of the Zweibak gardens.

... There are some hills, mountains you might call them, to the west of the town. Sometimes I walk in their direction about sundown, at which time their sides wear some fine colors. These mountains, a broad and well-cultivated plain, a flock of sheep met on the roadway, a few solitary kine driven by peasants, and here and there a little hamlet with its tinkling belfry, and a sweet and ample light over the whole, make up an agreeable view. I like the scenery about here better than most European scenery, far better than the pampered and petty scenery of England. But I miss everywhere I have been on this continent the sentient energy of nature in America, the dexterous and pliant mind which I saw in that country as a boy, and which I find again as often as I return there, the dazzling sword-play with which that invincible soul rains upon the underlying evening world the pride of its transcendent life. It is one of my regrets that my life has been passed away from that nature.

I say that what I saw in American scenery as a boy I find again whenever I return to it. During a short visit home a few summers ago I went to spend the night with some friends who live near West Point. It was upon a day such as is common in our semi-tropical summers. I had taken a late afternoon train from New York, and on arriving had but ten minutes in which to dress for dinner. My host had given me a room facing to the south. There was an airy and graceful combination of hills in view. I had little leisure to look out, but could see them as they ran upward in purple waves and filled the sky with their irresolute azure pathway; there lived among them a birdlike flight of outline, which soared, but did not depart, which, although infinitely evanescent, did not vanish, but remained. This scene, lying in the benign splendors of the golden South, and fraught with the fairest tropic color, bloomed beyond my open window.

A business errand took me northward along the Housatonic. The train follows for hours the line of the mountains, which run northward in waves, broken at long intervals, as if swept upward by the winds. I found those mountains as I had known them before. I saw them from the car window, pondering in their lucent bosoms memories pure, vast, sedate, profound, in unison with the dewy stars and the streams that rest for a moment in the midst of the meadows, and seem to say, "We also remember."

E. S. Nadal.

LOW PRICES, HIGH WAGES, SMALL PROFITS:—WHAT MAKES THEM?

THE minds of many persons have been and are greatly disturbed because there has been in recent years a great reduction in the prices of nearly all the leading articles of commerce, the principal decline dating substantially from the year 1873. This decline in prices began soon after the war in the United States, but the general decline in all countries on a specie basis may be dated from 1873.

By whatever standard prices are measured (and there are many carefully compiled tables), the average is found to be lower at the present time than at any period since a date anterior to the year 1850, in which year the great supply of gold from California, and a little later that from Australia, began to affect the volume of the money metals of the world.

In most of the discussions of the money question this great fall in prices has been treated as if it were a misfortune, and it is often held that any measure of legislation ought to be adopted which might tend to check it. Is not this a very partial and one-sided view of the subject?

Some one has wisely and wittily said that "it does not much matter what happens to the millionaire—how is it with the million?"

If it shall appear that out of this great reduction in prices the millions have gained higher wages; that hundreds of thousands of families have gained better homes and greater comfort in life; while those who have suffered temporary loss have been only the rich who have been incapable of adjusting themselves to the new conditions, or the unskilled poor who have been unable to grasp the greater opportunities for welfare which invention has offered them, then may we not come to the conclusion that diminished profits and low prices are merely the complement of higher wages and lower cost, and are, therefore, most certain indications of general progress from poverty to welfare, yet still leaving the problem open, how to help the unskilled poor?

It will be remembered that it has been stated that so far as the great mass of the people of this and of other lands are concerned, about one-half the cost of living is the price paid for the materials for food, the cost of food to common laborers who have families to support being as a rule much more than one-half their income.

The question of interest to those who as-

sume to be strictly "*the working classes*" is not so much what the price of the necessities of life may be, as it is how many portions of food, fuel, and clothing each one can buy at the retail shops in which they deal, and how good a shelter each one can procure for one day's or one year's earnings. In other words, what is, or what has been, the value of a day's labor when converted into the commodities which are necessary to existence?

If these so-called "working classes" have steadily gained in the purchasing power of their wages or salaries, while farmers, who number (not including farm laborers) 250 in each 1000, have also prospered during this period when prices have been falling and profits have been diminishing, then the economic history of the last 25 years may be presented in an entirely new aspect. In such case, instead of attempting to check the fall in prices by tampering with the standard of value or by other empirical devices "for making money plenty," it may be expedient to hold on to what has been gained and to fight it out on this line, even if several more years of so-called depression should follow this determination, these recent years of so-called depression having actually been years of greatest progress.

Since the end of the civil war in 1865, and yet more since the so-called panic of 1873, there has been greater progress in common welfare among the people of this country than ever before. It has been the period in which there has been the greatest application of science and invention to the production and distribution of food that ever occurred in any single generation in the history of this or any other country; and food is the prime necessity of material life.

In order to sustain this proposition, it is necessary to establish a standard of subsistence. This can be done with respect to the materials which are required for food, clothing, and fuel. Rent cannot be so surely included in this standard, because the conditions of shelter vary so much in different parts of the country and in different cities.

The cost of the materials for food, of materials for clothing, boots and shoes, and of fuel, probably represents about seventy per cent. of the cost of living on the part of well-to-do mechanics, railway employees, or of other persons in analogous occupations who may be considered in the average position of working people. All these elements of life have de-

and very greatly in their prices in the period under consideration. In some regions rents have declined, in others they have been stationary, in crowded cities they have either advanced in some small measure, or else the apartments hired for a given sum of money have not been equal to those previously occupied. So far as I have been able to compare rents, however, either those paid to a landlord or the rental value of premises owned by the occupant, there has not been, on the average, much variation from the rule affecting commodities in the period under consideration.

The standard portions of food, cloth, boots and shoes, and fuel which are made use of in the subsequent computation of the purchasing power of a day's or of a year's wages, have been established in the following manner:

FOOD.

By comparing data gathered by myself with other data gathered by several State Bureaus of the Statistics of Labor, it has been fairly established that the average food-supply of mechanics and adult factory operatives in the Eastern and Middle States cost in 1880, '81, and '82 substantially 25 cents per day, and consisted of very nearly the proportions of different kinds of food given in Table A.

The consumption of dairy products, sugar, tea and coffee given, is probably greater than in other parts of the country; but if a deduction of 2 cents per day be made for this, it then becomes necessary to add 3 cents per day (probably more) to account for the known average consumption of wine, beer, and spirits. (60,000,000 at 3 cents per day average comes to \$657,000,000.) Recent computations put the cost of liquor to consumers \$700,000,000.

Although the actual consumption of food, cloth, and fuel may not in any single case have corresponded identically with these standards, yet it may be safely assumed that the proportions are correct, and that the variation in the prices of what has been actually consumed will have corresponded to the variation in the prices of these standard articles and quantities.

For convenience in computation the small quantities of the single ration of food have been extended so as to cover 400 portions, which may be taken as the consumption of one year by one adult, 35 rations being added for extras.

TABLE A — Standard of a single day's ration, with its average cost in 1880, '81, and '82.

TABLE B — Standard of 400 rations, or 1 year's supply for 1 adult with 35 extra rations.

It is assumed that the prices of meat, fish, and poultry, fresh or salt, will have varied substantially with the variations in salt and smoked meats, and as the prices of the latter are more uni-

formly quoted, the prices used in making up the general standard are those given for salt and smoked meats. In the same way the price of vegetables has been taken as a standard for the variation in the price of all green vegetable food or roots.

A.—ONE RATION PER DAY.		B.—400 RATIONS.	
1/2 to 1 lb. meat, poultry or fish,	10	200 lbs. corned beef.	}
average according to kind and		100 lbs. salt pork.	
quality, costing on average . . .		100 lbs. smoked ham.	
1/2 to 3/4 pints milk	5	100 quarts milk.	}
1/2 to 1 lb. butter		30 lbs. butter.	
1/2 to 3/4 oz. cheese	1 1/2	20 lbs. cheese.	}
1 egg every other day		17 doz. eggs	
1/4 to 1 lb. bread . . .	2 1/2	1 barrel flour.	}
Vegetables and roots	2 @ 2 1/2	1/2 barrel corn meal.	
Sugar and syrup	2	20 bushels potatoes.	}
Tea and coffee	1	80 lbs. sugar.	
		4 lbs. tea.	}
		8 lbs. coffee.	
Salt, spice, fruit, ice, and sundries	1 1/2 @ 2	\$6 worth assumed at	}
		all dates.	
	25 cts.	\$100	

Standard portion of cloth for 1 year:	Standard of boots and shoes for 1 year:
10 yards medium brown cotton.	2 pairs men's heavy boots.
10 " standard gingham.	
10 " 37 in. bleached shirting.	Standard of fuel for 1 year:
20 " printed calico.	1 1/2 tons anthracite coal, or its
10 " 4-oz. woollen flannel,	equivalent in bituminous coal
or worsted dress g'ds.	or wood.
5 " 16-oz. cassimere.	
5 " Kentucky jean-satinet,	
or light cassimere.	

In establishing the average cost of a day's portion of the above, the prices given in Vol. XX. of the U. S. Census, in 10 shops east and 10 shops west of Buffalo, 1860-1880, have been averaged for each year designated. These prices have been verified from other sources of information. Prices of dry goods have been verified fully. Prices for 1885 and '86 have been derived from typical establishments and from market reports. The average of 1885 and '86 was probably less than the estimate used.

CLOTHING.

By a computation made by the undersigned when engaged in the compilation of the Census of the cotton manufacture of the United States in 1880, it appeared that if all the fibers of cotton, wool, silk, and flax, imported or raised, were carried through the factories and then converted into clothing, carpets, and other forms for final use, with the imports of textile fabrics added, the average consumption of textile fabrics by the people of this country in that year was substantially \$30 worth per head, of which about \$25 worth was for clothing. It being impossible to set up a standard of the exact cost of clothing, certain quantities of cotton and woollen cloth have been taken which are a little above the average consumption of the whole country. In a final computation, cloth is converted into clothing at the ratio of three parts materials, and two parts for manufacturing and distributing.

In this computation I have made great use of the XXth Volume of the United States Census. It was prepared by Mr. Joseph D. Weeks, and is of the greatest value in statistical research.

BOOTS, SHOES, AND FUEL.

THE standard of boots and shoes, and of fuel is of necessity somewhat arbitrary. It has been set at two pairs of men's heavy boots, as

the equivalent of a customary supply, and one and one-half tons of coal per adult per year; it being assumed that, as the prices of these quantities have varied, actual use and cost will have varied.

The quantities assigned to this specific standard of subsistence have risen and fallen in the following proportions, the figures representing so many cents per day for each standard portion, and the lines representing the relative variation at different periods.

Cost of standard portions of materials for food, for clothing, boots and shoes, and fuel, per day, in each year as designated.

It is doubtless true that the goods reported upon in the several shops from whose reports the prices have been derived, may have varied somewhat in quality; but the questions put by Mr. Weeks were in such form that in nearly every case the prices are given for specific qualities of each kind of food, as for instance: Flour, grade "extra family"; coffee, "Rio, roasted"; sugar, several grades — I have selected a medium; tea, "Oolong, or good black," etc., etc. These prices, taken from 20 shops — 10 east and 10 west — have been averaged, and the results compared with other price-lists, many of which the writer has himself procured.

It may be objected that this standard portion is only the one which is customarily consumed by each adult in the families of well-to-do mechanics or factory operatives in the Eastern or Middle States, and that it may not be a fair measure of those who are above this class or of those who are much below them. This may be admitted; but nevertheless all prices of the necessities of life must have varied substantially as these standard portions have varied. Moreover this final fall in the prices of products at their final point of consumption could not have occurred had not the prices of the metals, of the machinery, and of the whole mechanism of production and distribution also fallen. Sometimes prices of invested capital have fallen even in greater measure than the prices of the products. It is only here and there that any important article like timber can be found, which having become more scarce, has either maintained its price throughout the period, or is even a little higher now than it was in 1860.

If, then, all prices have fallen and all profits have diminished while wages have risen, each subject to temporary fluctuation and variation, must we not seek for deeper causes for the changes in the conditions of society and in the relations of men to each other than are commonly assigned in the explanation of such phenomena?

I now submit adequate proof of the facts. The subsequent table gives the purchasing power of wages at different dates, when converted into standard portions of food, cloth, and fuel as established.

The quantities represented in these tables are assumed to have been established on the basis of actual consumption of a well-to-do mechanic in New England in the period of 1880, '81, and '82. If we convert the money assigned to each portion of food, fuel, clothing, etc., into 400 portions corresponding to 1 year's consumption, with a margin of 10 per cent. for extras, we get the following results:

COST FOR ONE YEAR.

ONE PERSON.

Food for one adult.....	\$100
Materials for clothing	16
Boots and shoes.....	7
Fuel	9

FOUR PERSONS.

Food for four adults *.....	\$400
Materials for clothing.....	64
Boots and shoes....	28
Fuel	36

* Or for man and wife, one child over 12, and two under 12.

Gain in the purchasing power of wages, measured by the number of portions of the materials for food, clothing, tools and shoes, and fuel, which one year's work would buy at different periods: 300 working days to one year. Each portion consisting of the same quantities and corresponding to the daily consumption of establishments in New England and in the Middle States, as determined by close inquiry on the part of Bureaus of Labor Statistics, and of the undersigned.

CLASS I.—SPECIALLY SKILLED MEN: FOREMEN, OVERSEERS, BOSS BLACKSMITHS, CARPENTERS, ETC., CUSTOMARILY EARNING \$3.00 TO \$5.00 PER DAY AT THE PRESENT TIME.

Year	Average, per day	Average, per year, 300 days	Cost of day's portion	Purchasing power in number of portions.
1860	\$2.45	\$735.00	30 $\frac{2}{3}$ cts.	2374
1865	3.57	1071.00	55 $\frac{2}{3}$ "	1920
1870	4.34	1302.00	43 $\frac{2}{3}$ "	3000
1875	4.14	1242.00	38 $\frac{2}{3}$ "	3210
1880	4.14	1242.00	33 $\frac{2}{3}$ "	3737
1885 } 1890 }	Probably higher than in 1880	Est. 30 cts. or less	Not less than 4000	

The portions consist of uniform quantities of the same kinds of food, cloth, etc., and fuel bought at retail prices. The wages from 1860 to 1880, inclusive, are averaged from a large number of returns contained in Vol. XX. of the U. S. Census, compiled by Joseph D. Weeks.

CLASS II.—AVERAGE MECHANICS, ENGINEERS, BLACKSMITHS, CARPENTERS, MACHINISTS, AND PAINTERS CONNECTED WITH ESTABLISHMENTS REPORTED IN VOL. XX. OF THE CENSUS 1865 TO 1880 INCLUSIVE.

Year	Avg. per day.	Avg. per year.	Cost of portion.	Purchasing power.
1860	\$1.50	\$468.00	30 $\frac{2}{3}$ cts.	1572
1865	2.34	702.00	55 $\frac{2}{3}$ "	1261
1870	2.43	747.00	43 $\frac{2}{3}$ "	1716
1875	2.29	687.00	38 $\frac{2}{3}$ "	1776
1880	2.26	678.00	33 $\frac{2}{3}$ "	2040
1885 } 1890 }	Est. 2.40	720.00	Est. 30 cts. or less.	Est. 2400

CLASS III.—ALL THE OPERATIVES, EXCEPT FOREMEN AND OVERSEERS, IN 100 ESTABLISHMENTS REPORTING THE WAGES OF THEIR WORKING PEOPLE UNDER MORE THAN 1200 SEPARATE TITLES: BRICKS, MARBLE, FURNITURE, AGRICULTURAL IMPLEMENTS, TIN WARE, STOVES, BOOTS, HATS, CARS, WAGONS, FLOUR AND SAW MILLS, IRON, PAPER, AND TEXTILES, EMPLOYING MEN, WOMEN, AND CHILDREN, FROM 20 TO 2000 IN EACH.

Year	Average, per day.	Average, per year.	Cost of uniform portions, food, cloth, and fuel.	Purchasing power in number of portions.
1860	\$1.33	\$399.00	30 $\frac{2}{3}$ cts.	1290
1865	1.88	564.00	55 $\frac{2}{3}$ "	1013
1870	1.94	582.00	43 $\frac{2}{3}$ "	1337
1875	1.77	531.00	38 $\frac{2}{3}$ "	1372
1880	1.71	513.00	33 $\frac{2}{3}$ "	1543
1885 } 1890 }	Est. 1.80	540.00	Est. 30 cts. or less	1800

CLASS IV.—LABORERS, COMPETED SEPARATELY, CONNECTED WITH ABOVE ESTABLISHMENTS.

Year	Average, per day.	Average, per year	Cost of uniform portions, food, cloth, and fuel.	Purchasing power in number of portions.
1860	\$1.01	\$303.00	30 $\frac{2}{3}$ cts.	980
1865	1.56	468.00	55 $\frac{2}{3}$ "	840
1870	1.58	474.00	43 $\frac{2}{3}$ "	1090
1875	1.38	414.00	38 $\frac{2}{3}$ "	1070
1880	1.34	402.00	33 $\frac{2}{3}$ "	1210
1885 } 1890 }	Est. 1.40	420.00	Est. 30 cts. or less	1400

INCREASED PURCHASING POWER OF ONE YEAR'S WAGES COMPARED BY PER CENTAGE OF GAIN ON EACH CLASS.

Boston, Mass., Dec. 27, 1886.

Computed by EDWARD ATKINSON.

The cost of making and trimming, or of converting the cloth into clothing, would be for converting these specific quantities:

For one adult	\$10
For four adults	\$40

These elements constitute on the average seventy per cent. of the expenditure of a family such as has been taken as an example. We may add

For rent . . . eighteen to twenty per cent. . .	\$37.50	\$150
For sundries . . . twelve to ten per cent. . .	20.50	82
Totals . . . per adult, \$200; per family, \$800		

If we take the example of a mechanic sustaining himself, wife, one child over twelve years, and two under twelve counted as one adult, an average family of five persons counted as four adults, an expenditure of \$800 per year would call upon the head of the family to earn \$2.67 per day for three hundred working days in the year.

It will be remarked that this standard has been reached *theoretically*, on the basis of facts derived from observations entirely independent of the actual statistics of the family expenditure gathered by Commissioner Carroll D. Wright, as Chief of the National Bureau of Labor Statistics, and also of Massachusetts. On comparing these theoretic estimates with these statistics, they are found to correspond so closely with the actual facts gathered from many families, as to sustain the substantial accuracy of the proportions of the cost of living, the price of food being exactly one-half.

In the returns which have been made use of in compiling the tables given in this treatise, there are doubtless reports of prices of goods which do not exactly correspond to others either in kind or quality; but so many returns have been averaged as to eliminate this cause of error. I have made many computations on single returns of prices in special places procured by myself, and I find that the proportional variations correspond so closely to the average of all as to establish the standard conclusively.

In fact, the reduction in the cost of subsistence and the increase in the purchasing power of wages in the East have been greater than in the West, and greater than the average of the whole country, doubtless owing to the equalizing force of the railroads in diminishing the cost of food. I may give one example for which I have collated all the figures myself in order to verify the compilations of the Census. In this example I have taken the year 1866 as a starting point, and a cotton-mill as the example. It is not a fair year to show an average in other arts, because the conditions of the cotton manufacture were very uncertain dur-

ing that year; and it was also in the year 1866 that the most malignant effect upon prices and wages, worked by the substitution of legal tender notes in place of coin, was experienced in the United States. I have, however, selected a year in which the work was continuous during that year as well as during the year 1885.

The average earnings of all the hands in the factory through the year 1885 were \$3 cents per day.
In 1885 103 " " "

The product of each hand in pounds of cloth was in 1866, 7 pounds per day.
In 1885 13.34 " " "

The cost of labor in the pound of cloth was in 1866, 11.85 cents.
In 1885 7.07 "

The cost of the standard portion of food, clothing, and fuel (substituting three cords of wood for the customary portion of anthracite coal, because this factory was in a position where wood at that time was cheaper) was

Daily portion of food, clothing, and fuel in 1866, cost 57.82 cents per day.
In 1885 30.07 " " "

The purchasing power of 300 days' wages converted into these standard portions was in 1866, 430 portions.
In 1885 1000 "

It will be remembered that the price of food is about one-half the price of life to the class of persons represented in this example. Other examples have been computed by myself from private data in respect to the condition of operatives in woolen-mills and machine shops. They show the same law; but as the condition of the woolen-mill and the machine shop was somewhat better in 1866 than that of the cotton-mill, the ratio of progress is more nearly that of the average of the whole country than is shown in this particular example.

One very curious point is brought into notice by an analysis of the average food ration of the American workman. All the pork could be spared, and yet the daily ration would be more than ample. The waste of this country is an excess of fat rather than an excess of any other part of the food consumed. We have often heard "the American frying-pan" denounced; but this is, I think, the first time that it has been subjected to a scientific condemnation.

In a rough and ready way it takes five pounds of Western corn to make a pound of pork. Even the hogs do not consume their whole ration; they waste a part of it. The proportion is substantially one thousand pounds of Indian corn to a barrel of pork weighing two hundred pounds. In this conversion nearly all the

starch and all the protein are wasted, and the fat which is left is not required for use.

The necessary deduction is this, that the conversion of corn into pork is an absolute and total waste of nutritious food. Far better that corn should be converted into beef, or even burned for fuel (often a very economical expedient for settlers), rather than to be expended in this way.

A curious question arises in this connection. If the world were convinced that the Jews were right, and that pork ought not to be eaten; or if the American world were convinced that all the pork that is eaten is wasted, what would be the effect on the American farmers?

Having submitted this part of the problem to Professor Atwater, he makes the following remarks thereon:

"Taking your figures for quantities of shelled corn and dressed pork, and the most reliable data I can find for their composition, I obtain the following figures:

GAIN AND LOSS OF NUTRIENTS AND POTENTIAL ENERGY IN CONVERSION OF CORN INTO PORK.

	NUTRIENTS.			POTENTIAL ENERGY.
	Protein.	Fats.	Carbo-hydrates.	
	Pounds.	Pounds.	Pounds.	Calories.
In 1000 lbs. of corn	100	45	680	16,400,000
In 200 lbs. of pork	18	85	3,900,000
Loss or gain ..	82 loss	40 gain	680 loss	12,500,000

"In other words, the fat is increased by 40 pounds, and to offset this there is a loss of 82 pounds of protein and 680 pounds of carbohydrates. Estimated in potential energy, the loss makes over three-fourths of the whole.

"According to the best data at hand, and your ration agrees with them, our ordinary dietaries contain an excess of carbohydrate (sugar, starch, etc.) and a very large excess of fat. The 'condensing of corn into pork,' which we hear of as 'useful to save cost of transportation and handling,' means—

"First. Practically throwing away a lot of protein, the most valuable of the food ingredients, and with it a large amount of carbohydrates.

"Second. The conversion of part of the other nutrients into fats, so as to increase our already great excess of this material."

This may seem a somewhat trifling matter. Let us see.

Assuming that the product of this country, at its market value for final consumption or export, cannot exceed \$200 worth per person, \$600 worth for each group of three of whom one is occupied for gain, or \$1000 worth for each average family of 5 persons, it may be assumed that not exceeding 10 per cent., or \$20 worth a year per capita, can be saved, and added to the capital of the country, how-

ever such capital may be owned individually; 5 to 6 per cent., or \$10 to \$12 a year, must be set aside to meet all forms of taxation, national, state, and municipal. There remains \$168 @ \$170 a year, which constitutes the wage fund, it being manifest that the source of all wages, earnings, taxes, and profits must be the annual product, whatever that product may be.

If these sums per year be reduced to portions per day, the wages or earnings of each person amount to a fraction over 46 cents per day, or \$1.38 for every day in the year, including Sundays, secured by one person in three of the population who constitute the working forces. Profits amount to a fraction under 5½ cents per day; taxes to a fraction over 3 cents. The cost of the excess of fat and sugar in the standard ration is 7 cents out of 25. If this were saved and applied to shelter, the housing of the working people would be solved.

There cannot be more to be divided than all there is. The whole question, therefore, of relative welfare and poverty consists in the manner in which this product is divided.

The only way in which any great gain can be made is by increasing the quantity of product while decreasing the amount of capital and the hours or intensity of the work required in production, or else saving what is now wasted. Any other method of distribution that could be brought about might not very greatly improve the condition of any very large number of persons. This will be made apparent by a few figures.

If the sums given constitute all the money's worth there is to be divided, then by so much as some gain more must others gain less. The limit of all that is produced is the limit of all that can be divided.

The working group of this country, as I have stated, is substantially a group of three. One person in each three is occupied for gain, sustaining two others. If that part of the product which is now saved were divided equally among those who do the work, it would add only about 15 cents a day to the income of each one, or \$54.75 each year. In the present population of about sixty million, the number who are engaged in gainful occupation is twenty million. If the whole sum saved and added to capital were divided among this force equally at \$54.75 each, it would represent a little more than \$1,095,000,000.

Suppose this sum now saved were equally divided,—is it not true with regard to a very large proportion of those who do the work that the measure of their income is also the measure of their expenditure? Could this equal division then be made without leading to an increased consumption rather than to addi-

tional savings on the part of the many? If so, the next year's product of the whole country would suffer for lack of capital. It sounds like a paradox, but it may nevertheless be true that the faculty for "making money," as it is called,—that is to say, the instinct that leads to accumulation on the part of the few,—is absolutely necessary to the comfortable subsistence of the many. Disparity in the possession and direction of capital is apparently necessary to its effective use—a big capital in the hands of a master is like a big steam-engine directed by a competent engineer: each compasses three or four times as much product as the small capital held by many persons, or the small steam-engines, each wasting fuel, can accomplish. It may not be the disparity between rich and poor which is the sole cause of discontent.

The disparity in the conditions is very much greater, and is increasing more rapidly among those who constitute the "working classes" themselves, in the narrow use of that term, than any possible disparity between the capitalist classes and the working classes can ever be; that is to say, the disparity of the aggregate income, class by class, is greater.

The capitalists are working under an imperative law of diminishing profits. The workmen who do the work intelligently and skillfully are progressing under an imperative rule by which their wages are increased while the purchasing power of their wages is yet more increased.

Is there not perhaps a more subtle but very potent cause of discontent disclosed by the great disparity in the progress of working people themselves to the exclusion of capitalists, than can be found in the disparity of fortunes or in the possession of capital saved?

In the following table the relative progress of four classes whose condition has been fully analyzed is graphically pictured, each class compared to the other by the relative percentage of their gain since 1860.

No. I. Foremen, overseers, boss blacksmiths, and carpenters or other workmen of special skill and aptitude.

No. II. Average mechanics, engineers, blacksmiths, carpenters, machinists, painters, and the like.

No. III. Average workmen or women, in 100 factories or workshops listed under more than 1200 titles,—bricks, marble, furniture, tools, stoves, boots and shoes, hats, cars, wagons, textiles, iron works, paper-mills, etc.

No. IV. Common laborers connected with the same establishments.

The variation in the respective condition in these classes is shown by the number of portions of food, fuel, boots, and materials for clothing which one year's earnings would purchase in each of the years designated.

The actual working of these changes can

be better observed by a different form of diagram which gives the facts in relation to all the mechanics covered by class II.

The malignant effect of war and paper

money is shown by the rapid rise in prices, while wages slowly followed.

After the war wages fell slowly, but prices fell rapidly.

On the resumption of specie payments, wages again began to rise — prices continued to fall, and in 1885-6 the purchasing power of a day's work was greater than it ever had been before.

In order that the full import of these figures may be comprehended, the following table is given including a computation of rent on the best data which can be found.

It will also be observed, however, that while work has been continuous since 1873 or 1865 for all men of special skill and aptitude (with very rare exception for some short and exceptional period), and while work has also been continuous and well paid for every intelligent mechanic or artisan who has chosen to control his own affairs and to make his own bargains, it has been much less continuous for many classes of factory operatives of a lower grade, and it has been absolutely intermittent with respect

to great numbers of common laborers. One of the penalties which society must pay for the application of science and invention to the useful arts is this temporary displacement of unskilled laborers from the occupations in which their work had been previously required, but which is no longer required when some new machine or improvement renders it unnecessary.

On the other hand, without these applications of science to agriculture and to manufactures, the normal increase of population would without question tend to outrun the means of subsistence. It therefore follows that by their application, while the few are for a time left behind in the race, the many gain in welfare; the means of subsistence rapidly outrun the increase of population, and the many are thus enabled to enjoy better and better conditions of life.

Thus the problem of "progress and poverty" marches alongside the actual progress from poverty. This problem of "progress and poverty" calls for the urgent attention of the student and the

statesman in order to abate the great disparity of condition which becomes more conspicuous the more the general progress is assured. This special branch of the subject cannot be treated within the limits of the present treatise, but may be taken up at a future day.

We will now take up some of the theories which have been set up in the endeavor to explain the fall in prices since 1873. Subsequent to the year 1850, and either accompanying or perhaps caused in part by the very sudden and very great

addition of gold to the volume of the money metals of the world, there was a great advance in the prices of all the necessities of life, subject, of course, to temporary fluctuations. This period of general advance in prices culminated in the years 1872 and 1873, reductions in the prices of cotton and of some other articles having begun before. Since 1873 a great and general reduction of prices has taken place the world over. What has been called depression has been more common than activity in commerce. These long periods of depression have affected nearly all commercial and manufacturing countries alike, without much apparent regard to their system of taxation; to their standard of value, whether it has been based on gold only, on silver only, or on both metals; or whether the standard of value has been a paper substitute for true money.

By a comparison of the average of all these elements of the cost of living, rent being computed and estimating "sundries" at 10 per cent. of the whole, the relative importance of each element may be comprehended.

1860 to 1880 inc. census data verified by other authorities.

Food, per day	22 ⁸⁸ ₁₀₀	@	38 ³⁸ ₁₀₀	average	29 ⁸³ ₁₀₀	cents	
Clothing, per day	7 ⁵⁰ ₁₀₀	@	16 ⁶¹ ₁₀₀	"	9 ⁷⁷ ₁₀₀	"	
Rent, per day	6 ⁶⁰ ₁₀₀	@	8 ⁴⁷ ₁₀₀	"	7 ⁷³ ₁₀₀	"	
Fuel, per day	2 ²⁵ ₁₀₀	@	4 ⁸⁷ ₁₀₀	"	3 ¹¹ ₁₀₀	"	
Sundries, per day					5 ⁶⁰ ₁₀₀	"	
Total					56 ⁰⁴ ₁₀₀	cents	
Proportion of rent paid on land, assuming house and land equal value					3 ⁸⁶ ₁₀₀	cents	

Elements of the cost of living in New England in 1885 and '86, based on the prices of the same quantities of the same articles computed above, mainly from census figures. Prices ascertained by the writer on a narrower field than that covered by the census.

Food, per day	22	cents	
Clothing	6 ⁶⁴ ₁₀₀	"	
Rent	7	"	
Fuel	2 ⁵⁰ ₁₀₀	"	
Sundries	4 ²⁴ ₁₀₀	"	
Total	42 ³⁸ ₁₀₀	cents	
Average, 1860 @ 1880, inclusive	56 ⁰⁴ ₁₀₀	"	
Estimate, 1885 and 1886	42 ³⁸ ₁₀₀	"	
Total reduction in 1885-6	13 ⁶⁶ ₁₀₀	cents	

According to Prof. Atwater's analysis, the ration of food made use of in the above computations is 40 per cent. in excess of what is needed. All the pork, and one-half the sugar or one-half the potatoes could be spared. This reduction in the quantity of food would reduce the present cost of this ration from 22 to 15 cents per day. If the sum thus saved in food were expended for shelter, the whole question of providing better dwelling places might be solved. On this basis the proportions would be:

Food, per day	15	cents	
Clothing, per day	6 ⁶⁴ ₁₀₀	"	
Rent	14	"	
Fuel	2 ⁵⁰ ₁₀₀	"	
Sundries	4 ²⁴ ₁₀₀	"	
Total cost of subsistence per day	42 ³⁸ ₁₀₀	cents	

The importance of the food question could not, I think, be more clearly enforced.

It happens that during this period, dating from 1873, all the important changes in legislation respecting legal tender have occurred, yet the great international commerce of the world has proceeded in its customary way, because it is not possible to apply acts of legal tender to international exchanges; therefore this branch of commerce has been conducted on a solid basis of a given weight of the metal gold. But notwithstanding the stability of the gold standard of international commerce, great fluctuations have occurred, and periods of depression have affected international commerce as well as the domestic commerce of many countries.

Since 1873 Germany has displaced silver from its function of legal tender; the Latin Union soon ceased the coinage of silver; the United States have resumed specie payment upon a gold basis; Italy has also resumed specie payment. All these changes have doubt-

less tended to the use of gold as the unit of value of full legal tender among the so-called civilized countries of the world. Yet all these changes combined have required the substitution of gold for other forms of money only in the bank reserves of Germany and in the sub-treasury of the United States. Silver has not been demonetized anywhere. It is still money in a true sense in England, Germany, and France, as well as in India, Africa, and South America. The only change brought about by legislation has been in the substitution of a single kind of money as full legal tender, for two kinds.

But it has been assumed by many writers of repute that these changed conditions in acts of legal tender must have caused a steady and slow, but unceasing appreciation in the value of gold as compared to all other commodities, silver included.

On the other hand, it is held by many writers of repute that the vast store of gold which

has been added to the money metal of the world since 1850 has not only actually depreciated gold, but has also caused a yet greater depreciation in the value of silver, under the well-established rule that a substitution of a better article for common use may displace a substance of a poorer kind, and may cause the latter kind to lose a part of its value, even if the product of the latter be very much less in proportion than that of the former.

Such are the facts in regard to gold and silver. The addition of gold since 1850 has been vastly greater than the addition of silver.

The computed production of gold, 1849 to 1884, inclusive, has been \$3,882,975,000. That of silver, \$2,250,375,000.

This reference to the money metals is secondary to the main purpose of calling attention to an entirely different class of price-making factors. Under the conditions which have been presented, the battle of the standards has been waged with great virulence; but, perhaps, in consequence of this contest too little attention has been given to the really great forces which have been in action, and which have caused the reduction in prices which are so apparent.

The discussion of what I call the price-making factors will be mainly limited to the conditions which prevailed in the United States. For this reason, since 1865 there has been no war and no great preparation for war to alter the influence of the forces which make for peace and plenty. In Europe, on the other hand, actual wars, or enormous preparations for war, have altered all the conditions.

The change in prices in this country since 1860 must, of course, be in part attributed—

First. For a limited period to the forced circulation of paper substitutes for money which depreciated in value.

Second. To the restoration of the value of the previously depreciated paper to the standard of the only legal unit of value in this country,—to wit, the dollar made of gold.

No writer or observer of any repute has ever contested the fact that the rapid substitution of legal-tender notes for coined money always causes the depreciation of such notes and an increase in prices, as will be made apparent in the diagram previously given.

This sudden change in the standard of value is very different from the slow and steady addition of a very small annual percentage of precious metal to the previously existing stock, however large the volume of such addition of metal may appear to be when computed separately, year by year.*

In the tables which I have given, the malig-

* It has been for many years about half per cent. of gold and half per cent. of silver, which has been added

nant effect of the substitution of depreciated legal-tender notes for true money is made apparent by the much more rapid rise in prices than in wages or earnings from 1860 to 1865, thereby greatly diminishing the purchasing power of labor. Since that difficulty has been surmounted in part or wholly, the purchasing power of labor has greatly increased, gaining steadily the nearer the specie standard has been attained, and gaining yet more steadily the more closely it has been adhered to.

It may well be asked, if the reduction in the prices of the necessities of life could be attributed to a scarcity of gold, would not wages or earnings—that is, the price of labor—have been reduced in the same proportion?

May it not be held that labor in the concrete form of commodities, or, as we might say, in the *passive* form of commodities, could not be reduced in price by any such cause as a scarcity of gold without labor in the *active* form of work in the production of commodities being also reduced in price? If the true cause of the reduction in prices has been an appreciation or rise in the value of the metal gold, would it not of necessity have happened that the price of labor would have been affected in the same way? Would not the price of real estate have also been affected in the same way?

Again, if the cause of the reduction in prices had been an increased scarcity of gold, would not capital, when measured by the gold standard, have been able to secure to itself a constantly increasing rate of interest or income?

Now it happens that, in the United States, in so far as the specie standard of value has been departed from has the purchasing power of labor become less, while the earning power of capital has become greater; conversely, in the exact measure that the specie standard has been adhered to and sustained has the purchasing power of labor become greater, and the earning power of capital less.

Important as the settlement of the contest between those who sustain the double standard of gold and silver with the advocates of the single gold standard admittedly is, yet it is held that the battle of the standards cannot be settled without a full consideration of all the other factors which tend to alter prices to which reference is made in this article.

Although the war of the Rebellion required the work directly or indirectly of one in three of all men of arms-bearing age throughout the country, yet during this period there was no decrease in the production of articles necessary to subsistence, with the single exception

year by year to the existing volume according to the estimates of Henri Cernuschi.

of cotton. This fact gives evidence of the vast progress which must have been made in the application of science and invention to all the useful arts. The abnormal demands of war counterbalanced in some degree the malignant influences of the substitution of paper promises for true money; yet the prices of all commodities advanced very rapidly, while wages advanced much more slowly.

After the war, production gained immediately and enormously on population in respect to food, fuel, metals, and fibers. Wages ceased to advance in rates by the measure of money, but the money ceased to depreciate. The armies of both parties in the conflict were absorbed in the pursuits of industry within less than a year from the end of the war. In spite of this increase in the supply of labor, as soon as the policy of the government began to tend toward the resumption of specie payments, on or about 1870, although the prices of both commodities and labor began to decline in their nominal rates, yet, on

the other hand, the purchasing power of wages—that is, the absolute wages of labor—began to increase with great rapidity. The value of a day's labor to him who exerted it, yielded more and more of the necessities and comforts of life as the years went by. Presently wages began to advance again, but prices continued to decline.

In a previous number of *THE CENTURY*, I have given a table showing the increased product of railway mileage and of property insured against fire between 1865 and 1885. Objection has been taken to the date of 1865 as the starting-point, upon the ground that in that year the country had not surmounted the difficulties and retardation of the civil war. In the year 1870, however, all the causes of retardation growing out of the war had been removed, and the country was fairly headed toward the resumption of specie payments which took place on the 1st of January, 1879.

A table showing our progress since 1870 is therefore given now:

GAIN IN POPULATION, PROTECTION, WEALTH, AND SAVINGS 1870 TO 1885 AND ON SOME ITEMS TO 1886.

To	
1885	Population 48
1885	Production of grain 85
1885	Consumption of cotton 86
1885	Consumption of wool 88
1885	Production of hay 100
1885	Deposits in savings-banks of Massachusetts . . . 102
1885	Production of cotton 108
1886	Deposits in savings-banks of Massachusetts . . . 115
1885	Production of iron 143
1885	Insurance of property against loss by fire . . . 160
1885	Miles of railroad 168
1886	Miles of railroad 192
1886	Production of iron 200

In considering these relative gains, it will be observed that they represent a constant gain in the means of subsistence over population—that with the exception of the increase in personal wealth, which is indicated by the increase in the amount of property insured against loss by fire, they represent the progress of the million in the means of common welfare rather than of the millionaire in personal wealth, and that they give testimony to the beneficent law of progress *from* poverty.

While wages have risen, the earning power of capital has decreased.

The actual reduction in the earning power of capital, considered simply by itself, may be represented by the current rate of interest; the discount on the very best commercial paper at four or six months' date at different periods may be taken as a standard of the actual earning power of capital.

Prior to the financial panic of 1857, almost all the staple manufactures of this country were sold on 6, 8, 10, and sometimes 12 months' credit. After the commercial panic of 1857, and up to 1861 at the opening of the war, the current credit was four months. During the war, and up to about 1870, the traffic of the people was mainly conducted on a cash basis,

personal credit being rendered very uncertain by the variation in the value of paper substitutes for money. The instruments of exchange consisted of the depreciated notes of the United States. Bills of goods were rendered on ten to thirty days; but commercial notes disappeared almost wholly from the market.

Since 1870 there have been many variations in the customs of trade. In some kinds of business, notes have been given for actual purchases; in others none such have been given, but money has been borrowed in other ways; as, for instance, the large manufacturing corporations of the east have borrowed their working capital upon notes of the corporation, indorsed or guaranteed either by their officers or by the commission houses selling their

goods, such notes being negotiated in the open market at four or six months, or placed in savings-banks.

From 1848 to 1860 the writer kept a record of transactions by himself or by his associates in manufacturing corporations. The average rate of discount paid in the open market by the corporations enjoying the highest credit during this period was eight per cent., subject to very considerable fluctuations. From 1860 to 1869, inclusive, the rates of discount varied greatly with the circumstances of each case. The war and the continued issue of legal-tender notes rendered any standard of little moment. Railway corporations issued bonds at long date, at rates of interest from 7 to 8 per cent.; even as high as 10 per cent. was paid by railroad corporations of great strength and sound credit. In 1870 the slow restoration of specie payment began. Up to 1873, the year of panic, the rate of interest on the best manufacturing notes was on the average six and one-half per cent.

After the panic of 1873 ended, up to the 1st of January, 1879, five per cent. was the rate. Since the restoration of the specie standard at the latter date, down to the present time, the fluctuations in the rate of discount on the very best commercial notes have been 3 to 5 per cent.; and by the actual record of a broker doing a very large business, they have averaged 4 per cent. on 6 months' paper.

By the kindness of Mr. Lyman J. Gage, of Chicago, I have obtained the rates of discount on commercial paper at that point. They are about the same in their proportion, having been reduced from an average of 10 per cent. or over, to an average of 5 per cent. or less between the dates 1860 and 1886. On Western farm mortgages the change has been much greater. Twenty-five years ago rates as high as 25 per cent. were paid on mortgages of Western land, on what has proved to be excellent security. The rate now charged is seven per cent. and even less.

This immense abundance of capital seeking investment, and the equalization of the rates of interest between the East and the West, may be attributed more to the railway service and to the reduction in freight charge than to any other single factor affecting the interest of capital. The whole country has become a close neighborhood, each part sustaining the other, so that the distribution of capital has become more and more uniform throughout the country, except in States whose public credit is still bad. So long as the public credit is bad in any community, the rate of interest on private capital will be very high.

The effect of changes in the railway service is witnessed by the following table:

Merchandise or freight traffic of all the railways of the United States in 1885. Authority, "Poor's Railway Manual," 1886.

Tons moved	437,040,099
Tons moved 1 mile	40,151,894,469
Charge for service	\$510,690,992
Rate per ton per mile	1 $\frac{11}{100}$ cents

Twenty-seven trunk lines which separately or in combination center in Chicago from the West, or connect Chicago with the Eastern seaboard:

Tons moved	185,320,709
Tons moved 1 mile	25,125,076,247
Charge for service	\$219,872,732
Rate per ton per mile	0 $\frac{87}{100}$ cents

All other lines:

Tons moved	251,719,390
Tons moved 1 mile	24,026,818,222
Charge for service	\$299,818,260
Rate per ton per mile	1 $\frac{24}{100}$ cents

Measure of this service per head of population and per family.

Lines.	Tons per person, per year.	Distance hauled.	Charge pr. person	Ch'rg per family of 5 persons.
	Tons.	Miles.		
27 trunk lines	3 $\frac{21}{100}$	136	\$3.68	\$18 40
All others	4 $\frac{14}{100}$	95 $\frac{1}{2}$	5.26	26.30
Totals	7 $\frac{35}{100}$	111 $\frac{1}{2}$	\$8.94	\$44.70

The average charge per ton per mile, on the 27 trunk lines in the years 1865-68, inclusive, exceeded that of 1885 by 1 $\frac{63}{100}$ cents. At this rate of excess applied to the whole traffic of the United States, all other lines having made a greater reduction, so far as the data can be had the sum saved in the year 1885 was \$803,633,477 as compared to 1865-68.

The whole service of all the railroads in 1885 consisted in moving 42 pounds a day of food, fuel, fibers, and fabrics a distance of 111 $\frac{1}{2}$ miles for each man, woman, and child of the population, or 1470 pounds a week for a family of 5. The average charge to each person was a fraction under 2 $\frac{1}{2}$ cents per day, or 87 $\frac{1}{2}$ cents per week for each family of 5.

The common highways are open to all who do not choose to subject themselves to the alleged monopoly of the railways. One man with a one-horse cart could probably haul 1470 pounds 111 $\frac{1}{2}$ miles in a 7 days' journey — 1 day devoted to rest. What would it cost?

In considering this reduction in the charge on railways, it must be remembered that a very large portion of these railways built since 1865 have taken the place of the wagon roads, or of what are known in the West as "dirt roads," so that the saving to the people of the United States by the mere existence of the new roads, whatever they may charge, is much greater than the mere reduction of their charges since they came into existence; but the latter saving is so big that anything else may be disregarded.

Reduced to the unit of the individual, the saving in the cost of railway service amounts to \$13.67 per head of the population each year, or a fraction under \$60 a year for every family of 5 persons. This sum would have paid

all the taxes which have been assessed throughout this period by the people of the United States for national, state, county, city, and town expenditures, including that part of the taxation which has been applied to the reduction of debts, whether national, state, or municipal.

Or we may put this in another way. A sum, representing the saving of the last four years only as compared to the rates of 1865-68, would doubtless have sufficed to cover the cash cost of the construction of the 100,000 miles of new railway built between Jan. 1, 1865, and Jan. 1, 1887, at an average cost of \$30,000 per mile.

In a previous article in *THE CENTURY* it has been demonstrated that all our present crops, or products from land which is under the plow, omitting those which are derived from pasturage, have been derived from a little over 300,000 square miles of land.

Now between the dates January 1, 1865, and January 1, 1887, more than 100,000 miles of railway have been constructed. If we lay out a strip of land only 5 miles in width, alongside each of these new lines, it would cover an area of 10 miles by 100,000, or 1,000,000 square miles of land,—three times as much as is now under the plow, of which every acre has been brought within less than five miles of a railway since the year 1865.

While these great price-making factors have been working out their just results in the United States, the charge for moving food across the sea by steamships has been reduced in almost as great a measure. The substitution of the screw for the side-wheel, the construction of large vessels made of steel, and the use of the compound engine of two cylinders, now supplemented by the triple compound, the opening of the Suez Canal, and other new forces applied to distribution, have altered all the conditions in Europe as well as in this country.

Only a passing reference can be made in this article to other price-making factors. This department has been very fully treated in a recent pamphlet by Mr. Wm. Fowler, L.L. B., whose article upon the alleged appreciation of gold, lately published by the Cobden Club, is one of the most satisfactory treatises yet issued.

Among the other forces which have tended to reduce prices during the last twenty years, is the Bessemer process for making steel, since supplemented by the "basic process," which latter process has brought the phosphoric iron mines of Germany into full production, previously almost useless; the application of gas for fuel; the use of natural gas for the same purposes in this country; improvements in agriculture in the use of the buggy-plow, the gang-plow, etc., the self-binder attached to the reaper; such improvements in all the tex-

tile arts that one operative now performs all the textile work that could be done by two or more twenty-five years ago; the improvements in the use of machine tools applied to all arts; and the like.

In point of fact, it is not too much to say that one-half as much capital as was required to do the general work of life in 1865 will now suffice to aid labor in compassing the same amount of product. That is to say, it took twice as many dollars' worth of capital to accomplish a given product 20 or 25 years since as is now needed.

On the other hand, the owner of the capital is now compelled, whether he will or not, to be satisfied with one-half the income on each unit or dollar's worth of the present capital, if he trusts only to his capital for his means of living.

Even in the matter of the use of gold, reference might be made to the economy brought about in banking and exchange; the use of the telegraph and the like; the saving of time in the transportation of commodities: all of which subjects are fully treated in Mr. Fowler's essay.

In fact, if all the changes which have been worked by the elimination of time and distance from the conduct of affairs were to be considered, it would require a volume instead of an article to picture them.

It thus appears that, while the purchasing power of a day's or year's labor has increased since 1860 from 40 to 70 per cent. according to the grade or skill of the workman, and from 66 to 108 per cent. since 1865, and while the earning power of capital, considered without regard to the skill of its owner, has diminished absolutely one-half and relatively at least 75 per cent. since 1860, there have yet been periods when it has been difficult for many workmen to find work, when also capital could not find employment, and when there was want in the midst of abundance.

Can these faults in the present forms and methods of society be remedied by legislation, by coöperation, by profit-sharing, or by the state assuming more and more the control and direction of the forces of capital? These are questions which demand an answer.

That there has been grave discontent on the part of labor, and a want of that true comprehension of what may rightly be called "the claims of labor" on the part of many capitalists, may not be denied.

What are some of the causes of this discontent, and how shall admitted wrongs be righted?

It is a matter of common knowledge that the application of machinery in special arts often causes the displacement of the craftsman, the hand-worker, or the common laborer who has been trained in that art, and who finds it

difficult to adjust himself to new conditions. This fact, which has been a matter of common observation in single arts, has affected nearly all the arts of life in the last 25 years more profoundly than ever before. There have been single great inventions, like the application of steam, which have gravely altered the conditions of society; but there have probably never been so many applications of science and invention to the common arts of life as have been applied in the present generation, nor has any single one ever been so potent in modifying and changing all the conditions of society as the sinking of time and distance in the fraction of a cent a ton on a mile of railway.

In this country, where these great new forces have been more free to act than in any other, there are certain facts which must be admitted by every one competent to observe. Leaving wholly out of view the transfer of property already saved from one person to another in the gambling operations of the stock exchange, such incidents being of no material consequence except to those who engage in them, we may observe —

First. That the direction and use of capital are becoming more and more a matter of scientific training, as the margin of profit in every art comes to a less and less fraction of the product made or distributed. The merchant adventurer has gone the same way with the craftsman and his apprentice — he has disappeared with the removal of the mysteries of trade.

Second. Although great fortunes have become more conspicuous, their number is very small, and their aggregate amount is yet smaller in proportion to the amount and great number of moderate fortunes which are not conspicuous but which are steadily increasing.

Third. Adjacent to every city are suburbs or neighboring towns which are filled with comfortable dwellings of moderate size, which give evidence of comfort and welfare steadily increasing on the part of an increasing portion of those who perform the practical work of the country. These are the dwelling-places of their respective owners or occupants, who are not capitalists in any sense, but who have assured to themselves an abundant subsistence, a home, and a safe position in the community.

Fourth. While great bonanza farms are conspicuous, they are also few in number; the increase in small farms is very rapid; and perhaps the increase has been yet more rapid compared to what it had been before agricultural machinery, science, and invention had come nearer to the farm.

Fifth. By comparison with this rapid progress not only of those who are in a position

of wealth, but of the vast number who, although not making great savings, are living year by year more comfortably, better housed, better clothed, and better fed, the bad condition of the very poor, and the more uncertain position of the common laborer whose opportunity for work is intermittent, becomes more apparent and therefore demands urgent attention.

If such are the facts which are disclosed by the actual observation of the conditions of men, and confirmed by the deductions drawn from them in this and other cities, do we not find in the very gain in the purchasing power of wages a cause of an increasing disparity in the conditions of those who class themselves as "working people," in a limited sense? and may not this be one of the grave causes of discontent, even though all have made some progress? Is it not apparent that while the very poor are proportionately no more numerous, and the ratio of common laborers to others is no greater, yet within the lives of men who are not yet beyond middle age, great numbers among the workmen themselves have seen those who started on nearly the same plane, and who in 1860 could earn but little more than their fellows, yet in 1885 and '86, raised far above them in their condition, although still classed as fellow-workmen?

To him who has had the capacity, either mental, mechanical, or manual, to take advantage of the opportunity afforded by science and invention, has been given the greatest progress; while from him who has not the mental or manual aptitude to adjust himself to the new conditions, has been taken even the opportunity for common labor which he enjoyed before.

Do we not witness in the various organizations of labor, so called, an attempt to equalize this growing disparity? It is often claimed that "equal work is entitled to equal pay"; but the difference in the quality of the work may not be overlooked. The attempt is made to control the hours of labor by various artificial methods. In respect to minors, and possibly in respect to women so long as they do not vote, such laws may be necessary. Other attempts are made by establishing stated lists of prices, by limiting the quantity of work to that done by any one man, by limiting the number of apprentices, and by other similar methods, to equalize the material conditions of men. But all these efforts fail wholly or partly. An equal quantity of work measured only by the time devoted to it or by the actual amount of work required in it, never has and never will secure equal results. It is not in the nature of things. It is the efficiency of labor that tells, not the quantity or time. One man will waste more leather in a given

time by want of aptitude or skill in its use than another man will convert into good and useful boots and shoes. Profit may be defined as the margin which mind gains over muscle. This is as true of the higher gain in skillful work when done by the piece as in the use of capital already saved.

The result of all these artificial methods to control conditions which rest upon individual capacity, when even partly enforced, is to level down the earnings of the industrious and the capable to the plane of the unskillful or lazy.

When this truth dawns upon the mind of the discontented, then the trade organization or association soon changes its course and begins to promote the development of individual capacity; it becomes a common school in social science; its members soon find out what a really beneficent force may be developed by organizing labor.

I have endeavored to present the great price-making forces which have been evolving progress from poverty during the present generation, and I may again repeat what I have often had occasion to state. The necessary conclusions to which we are led are —

First. When organized capital is placed at the service of labor, it becomes more and more effective, while in amount it diminishes in ratio to product. It therefore secures to its own use a diminishing portion of, or profit from, an increasing product. This is the economic law, so called, of diminishing profits.

Second. Organized labor, when each member is left free to avail himself of every opportunity which capital, science, and invention place at his disposal, secures to itself an increasing share of an increasing product or its equivalent in money.

Third. As capital and labor become more under the control of common intelligence they cannot help becoming more closely allied; under these conditions high wages or large earnings in money, or in what money will buy, become the necessary result or reflex of the low cost of production.

Fourth. A low cost of production accompanied by high wages is most fully assured by the application of science and invention to all the arts of production and distribution. Pauper labor, so called, may be dreaded only by those who possess pauper intelligence. The competition which is really to be courted and emulated is that which is represented by the art schools of France, the weaving schools and the like of Germany, the trade schools and the industrial schools which have spread more rapidly in England in recent years than they have in this country. Skill and intelligence, free from the burden of standing armies and

of war taxes, may command the commerce of the world.

The present population of the globe is computed at about 1,400,000,000; of these only about 400,000,000 belong to what may be called the machine-using nations. 1,000,000,000 do their work by hand, or by the use of rude tools guided by the hand.

In a peaceful contest for commerce with these nations, who will win? Certainly that nation will *not* win which obstructs the import of the crude products which are all that these non-machine-using nations can give in exchange for what they need, by imposing heavy taxes upon such products when they enter the ports of our country.

But when all has been accomplished which can be done by law or by association, or by the repeal of obstructive acts, there will still remain centers of pauperism in our cities; they exist mainly among those of foreign birth who cannot adjust themselves to the new conditions to which they are subjected. There will also continue to be periods when common laborers will find it difficult to obtain work. How shall we meet these admitted faults? Is there any other way than by adapting the methods of common-school education more nearly to the necessities of life? If it is true that one cannot permanently help either men or women who cannot help themselves, is it not equally true that classes in society in considerable numbers cannot be raised from a state of dependence upon others, except by the development of each member of such class to a knowledge of some art by which he can sustain himself, even if it be only a training in the application of the hand itself to useful work?

Nine-tenths of the occupations of the people of this country in point of number still depend upon the individual capacity, the mental development, the mechanical aptitude, or the manual dexterity of each person. Only one in ten is occupied in a great factory where the conduct of the work depends upon the minute subdivision of labor.

Does not this fact bear witness to the necessity of promoting the development of the individual in order that common welfare may be attained by every man, woman, and child in the community?

What can the state do for its citizens in helping them to obtain subsistence, if the people who constitute the state are themselves incapable of sustaining their own families under present conditions?

Neither the state nor the nation possesses property. The state only controls the property of its citizens by right of eminent domain. It can take property under due process of law

for public use, with compensation to him who owns it. It can tax all property in order to maintain governments. It may tax all property in order to perform certain useful functions which, by common consent, the state can perform in its corporate capacity better than the citizens can in their individual capacity. But the state as state has no productive power, and it is upon the annual product that all depend alike.

In this country at the present time there is and can be no lack of most abundant product. We waste every year enough to sustain another nation half as numerous, if not equal in number. The mechanism of distribution is more than ample: yet there is want in the midst of plenty.

Progress from poverty is the common rule. "Progress and poverty" is the marked exception, conspicuous and dangerous. In one sense every man is his brother's keeper. If he neglects his duty and cares not for his neighbor, the tax gatherer, at least, will find him out and will compel him to do at the greatest cost what perhaps he might have accomplished at the least cost, had he himself realized his own responsibility.

There is one thing no man can invent, and that is a form of society in which the rights, whether of the rich or of the poor, shall not be accompanied by corresponding duties. He who treats these economic problems without taking the moral and ethical side of life into consideration may rightly be called a representative of "a dismal science." But it by no means follows that we must seek to reconstruct humanity in our effort to form society. The subject of economic science is man as he now is, with all his faults, his selfishness, and his failings. It was said of old time that "surely the wrath of man shall praise thee." Might not the prophet of the present affirm with equal insight, "The power which makes for righteousness compels not only the enlightened self-interest of man, but his very selfishness, to work out the progress of humanity?"

The commerce of the world now turns from one side of the globe to the other on a margin of a cent on a bushel of grain, a dollar a ton of metal, a quarter of a cent a yard on a textile fabric, or the sixteenth of a cent a pound on sugar. The cube of coal, as I have before stated, which would pass through the rim of a quarter of a dollar, when used in connection with the compound engine will drive a ton of food and its proportion of the steamship two miles on its way from the producer to the consumer; by the invention of the triple compound, one-fourth even of this fuel has been saved.

The profit or loss of this great nation turns on the price of a daily glass of lager beer.

When this article is read, five cents a day, more or less, to each inhabitant of the country will represent \$1,095,000,000 worth of product, which may be either saved or wasted according to the measure of the intelligence of each person. The profit which might be represented by this sum of money may be diminished one-half by the ignorance of legislators who take no cognizance of the facts of life when framing the statutes by which they undertake to regulate and control an organism which yet makes its way steadily onward with greater or less effort, whatever may be the system of laws by which its progress is either helped or hindered.

These computations are submitted for what they are worth. They are probably as near to the facts as it would be in the power of any private student to bring them, whose opportunity for study or for treating these questions is very limited.

In the attempt to comprehend the laws of social science by reading and studying treatises upon political economy, the writer long since met the difficulty which would be apt to occur to a business man,—to wit, the necessity for a statement of accounts and a trial balance. In the attempt to make such a statement and to balance the accounts of one class with another, and of one branch of industry with another, he has himself come to certain conclusions which coincide very closely with the modern teaching of political science.

The science of life does not consist in *laissez faire*, or letting alone. There are many objects which may be better attained by the state, town, or city undertaking them than they could if left to individual or corporate enterprise. There are many others which it is often proposed to have the state assume, which are utterly beyond the functions of the state in its corporate capacity to manage.

Among the prime factors which make or mar material prosperity there are grave differences. The conclusion of the writer is, like that of all the economists whose works have any standing among men, that tampering with, or debasing the standard of value is the most malignant fraud which the government can perpetrate. The cost of substituting paper notes for true money under the stress of war added without question to the cost of the civil war as much as the whole sum of outstanding debt yet unpaid. The most beneficent factor in the lowering of prices and in raising wages has been the extension of the railway system and the reduction in the charge for the service. Vanderbilt was the typical railroad man of his day; he was also the great communist of his

time, because he reduced the cost of moving a barrel of flour a thousand miles to so small a sum that it can hardly be measured in a loaf of bread, at a margin of profit to himself and his associates which is now less than the value of the empty barrel at the end of the line. The heavy taxes which we are now paying are but a slight burden upon the people; so long as they can be applied to the payment of the public debt, they may be justified, however unscientifically and injudiciously the acts for collecting them may be framed.

Whatever may be the opinions or theories of each reader upon these various problems upon which every voter in a free country must pass whether he will or no, it is held that there can

be no true solution unless it is based upon facts. It has been the purpose of the writer in this series of CENTURY articles to give these facts rather than to present his own theories; to ask questions rather than to attempt to answer them.

It may now be suitable to submit a very few examples proving how the rule of diminishing prices, decreasing profits, and diminishing cost of labor has been consistent with the general rise in the rates of wages and in their purchasing power. This principle would of necessity be deduced from all the tables which have already been submitted; but a few specific examples may be a matter of curious interest, and will fully sustain it.

EXAMPLES OF REDUCTIONS IN PRICE—REDUCTION IN COST OF LABOR—RISE IN RATE OF WAGES AND INCREASE IN PURCHASING POWER OF WAGES.

STANDARD COTTON SHEETING.

Year.	Price per Yard.	Cost of Labor per Yard.	Earnings per Year.	Purchasing Power in Food, Cloth, and Fuel.

Compiled from Vol. XX. U. S. Census by Joseph D. Weeks; computed by Edward Atkinson, and verified by comparison with other authorities.

Could space be spared me, examples of the same kind could be added from almost every industry to which modern machinery has been applied, but these must suffice.

Edward Atkinson.

OPPOSING SHERMAN'S ADVANCE TO ATLANTA.*

A MAP OF THE ATLANTA CAMPAIGN, AS FURNISHED BY GENERAL SHERMAN. THE ROUTE OF SHERMAN'S ADVANCE IS INDICATED BY A DOTTED LINE. THE ROUTE OF THE CONFEDERATE ARMY IS INDICATED BY A SOLID LINE. THE ROUTE OF THE ARMY OF THE TENNESSEE IS INDICATED BY A DOTTED LINE. THE ROUTE OF THE ARMY OF THE MISSISSIPPI IS INDICATED BY A SOLID LINE.

PRESIDENT Davis transferred me from the Department of Mississippi to the command of the Army of Tennessee by a telegram received December 18th, 1863, in the camp of Ross's brigade of cavalry near Bolton. I assumed that command at Dalton

on the 27th, and received there, on the 1st of January, a letter from the President dated December 23d, purporting to be "instructions."

In it he, in Richmond, informed me of the encouraging condition of the army, which "induced him to hope that I would soon be able to commence active operations against the enemy."—the men being "tolerably" well clothed, with a large reserve of small arms, the morning reports exhibiting an effective total that exceeded in number "that actually engaged on the Confederate side in any battle of the war." Yet this army itself had lost in the recent campaign at least 25,000 men in action, while 17,000 had been transferred from it in Longstreet's corps, and two brigades had been sent to Mississippi; so that it was then weaker by 40,000 men than it was when "engaged on the Confederate side" in the battle of Chickamauga, in the September preceding.

In the inspections which were made as soon as practicable, the appearance of the army was very far from being "matter of much congratulation." Instead of a reserve of muskets there was a deficiency of six thousand and as great a one of blankets, while the number of bare feet was painful to see. The artillery horses were too feeble to draw the guns in fields, or on a march, and the mules were in similar condition; while the supplies of forage were then very irregular, and did not include hay. In consequence of this, it was necessary to send all of these animals not needed for camp service to the valley of the Etowah, where long forage could be found, to restore their health and strength.

The last return of the army was of December 20th, and exhibited an effective total of less than 36,000, of whom 6000 were without arms

and as many without shoes. The President impressed upon me the importance of recovering Tennessee with an army in such numbers and condition. In pages 548-9 of his volume, "The Rise and Fall of the Confederate Government," he dwells upon his successful efforts to increase its numbers and means adequately. After the strange assertions and suggestions of December 23d, he did not resume the subject of military operations until, in a letter of February 27th to him through his staff-officer, General Bragg, I pointed out the necessity of great preparations to take the offensive, such as large additions to the number of troops, an ample supply of field transportation, subsistence stores, and forage, a bridge equipage, and fresh artillery horses. This letter was acknowledged on the 4th of March, but not really replied to until the 12th, when General Bragg wrote a plan of campaign which was delivered to me on the 18th by his secretary, Colonel Sale. It prescribed my invasion of Tennessee with an army of 75,000 men, including Longstreet's corps, then near Morristown, Tennessee. When necessary supplies and transportation were collected at Dalton, the additional troops, except Longstreet's, would be sent there; and this army and Longstreet's corps would march to meet at Kingston, on the Tennessee River, and thence into the valley of Duck River.

Being invited to give my views, I suggested that the enemy could defeat the plan, either by attacking one of our two bodies of troops on the march, with their united forces, or by advancing against Dalton before our forces there should be equipped for the field; for it was certain that they would be able to take the field before we could be ready. I proposed, therefore, that the additional troops should be sent to Dalton in time to give us the means to beat the Federal army there, and then pursue it into Tennessee, which would be a more favorable mode of invasion than the other.

General Bragg replied that my answer did not indicate acceptance of the plan proposed, and that troops could be drawn from other points only to advance. As the idea of advancing had been accepted by me, it was evidently his strategy that was the ultimatum.

I telegraphed again (and also sent a confidential officer to say) that I was anxious to take the offensive with adequate means, and to represent to the President the actual dis-

* For other articles, pictures, and map relating to the Atlanta campaign, see THE CENTURY for July.

GENERAL JOHN B. HOOD, C. S. A. (FROM A PHOTOGRAPH.)

parity of forces, but without result. The above is the substance of all said, written, or done on the subject of Mr. Davis's pages 548-9, before the armies were actually in contact, with odds of 10 to 4 against us.

The instruction, discipline, and spirit of the army were much improved between the 1st of January and the end of April, and its numbers were increased. The efforts for the latter object brought back to the ranks about five thousand of the men who had left them in the rout of Missionary Ridge. On the morning report of April 30th the totals were: 37,652 infantry, 2812 artillery with 112 guns, and 2392 cavalry. This is the report as corrected by Major Kinlock Falconer, assistant adjutant-general, from official records in his office.

General Sherman had assembled at that time an army of 98,797 men and 254 guns; but before the armies actually met, 3 divisions of cavalry under Generals Stoneman, Garrard, and McCook added 10,000 or 12,000 men to the number. The object prescribed to him by General Grant was "to move against Johnston's army, to break it up, and to get into the interior of the enemies' country as far as he could, inflicting all the damage possible on their war resources."

The occupation of Dalton by General Bragg had been accidental. He had encamped there for a night in his retreat from Missionary Ridge, and had remained because it was ascertained next morning that the pursuit had ceased. Dalton is in a valley so broad as to give ample room

for the deployment of the largest American army. Rocky-face, which bounds it on the west, terminates as an obstacle, three miles north of the railroad gap, and the distance from Chattanooga to Dalton around that north end exceeds that through the railroad gap less than a mile; and a general with a large army, coming from Chattanooga to attack an inferior one near Dalton, would follow that route and find in the broad valley a very favorable field.

Mr. Davis descants on the advantages I had in mountains, ravines, and streams, and General Sherman claims that those features of the country were equal to the numerical difference between our forces. I would have gladly given all the mountains, ravines, rivers, and woods of Georgia for such a supply of artillery ammunition, proportionally, as he had. Thinking as he did, it is strange that he did not give himself a decided superiority of actual strength, by drawing troops from his three departments of the Cumberland, the Tennessee, and the Ohio, where, according to Secretary Stanton's report of 1865, he had 119,000 men, fit for duty. The country in which the two armies operated is not rugged; there is nothing in its character that gave advantage to the Confederates. Between Dalton and Atlanta the only mountain in sight of the railroad is Rocky-face, which aided the Federals. The small military value of mountains is indicated by the fact, that in the Federal attack on June 27th our troops on Kennesaw suffered more than those on the plain.

Major-General Gilmer, chief engineer, in the previous winter wisely had made an admirable base for our army by intrenching Atlanta.

As a road leads from Chattanooga through Snake Creek Gap to the railroad bridge at Resaca, a light intrenchment to cover 3000 or 4000 men was made there; and to make quick communication between that point and Dalton two rough country roads were so improved as to serve that purpose.

On the 1st of May I reported to the Administration that the enemy was about to advance, suggesting the transfer of at least a part of General Polk's troops to my command. Then, the cavalry with convalescent horses was ordered to the front.—Martin's division to observe the Oostenveld from Resaca to Rome, and Kelly's little brigade to join the cavalry on the Cleveland road.

On the 4th the Federal army, including the troops from Knoxville, was at Ringgold. Next day it skirmished until dark with our advanced

guard of cavalry. This was repeated on the 6th. On the 7th it moved forward, driving our cavalry from Tunnel Hill, and taking a position in the afternoon in front of the railroad gap, and parallel to Rocky-face (see map, next page)—the right a mile south of the gap, and the left near the Cleveland road.

Until that day I had regarded a battle in the broad valley in which Dalton stands as inevitable. The greatly superior strength of the Federal army made the chances of battle altogether in its favor. It had, also, places of refuge in case of defeat, in the intrenched pass of Ringgold, and in the fortress of Chattanooga; while we, if beaten, had none nearer than Atlanta, 100 miles off, with 3 rivers intervening. General Sherman's course indicating no intention of giving battle east of Rocky-face, we prepared to fight on either side of the ridge. For that object, A. P. Stewart's division was placed in the gap, Cheatham's on the crest of the hill, extending a mile north of Stewart's,

MAJOR-GENERAL W. H. T. WALKER, U. S. A., KILLED NEAR ATLANTA, JULY 22D, 1864. (FROM A PHOTOGRAPH.)

and Bate's on the west and extending a mile south of the gap. Stevenson's was formed across the valley east of the ridge, his left meeting Cheatham's right; Hindman in line with Stevenson and on his right; Cleburne behind Mill Creek and in front of Dalton. Walker's division was in reserve.

MAP OF THE ATLANTA CAMPAIGN.

SCALE OF MILES
0 5 10

Cantey with his division arrived at Resaca that evening (7th) and was charged with the defense of the place. During the day our cavalry was driven from the ground west of Rocky-face through the gap. Grigsby's brigade was placed near Dug Gap,—the remainder in front of our right. About 4 o'clock P. M. of the 8th, Geary's division of Hooker's corps attacked two regiments of Reynolds's Arkansas brigade guarding Dug Gap. They were soon joined by Grigsby's brigade on foot. The increased sound of musketry indicated so sharp a conflict that Lieutenant-General Hardee was requested to send Granbury's Texan brigade to the help of our people, and to take command there himself. These accessions soon decided the contest, and the enemy was driven down the hill. A sharp engagement was occurring at the same time on the crest of the mountain, where our right and center joined, between Pettus's brigade holding that point and troops of the Fourth Corps attacking it. The assailants were repulsed, however. The vigor of this attack suggested the addition of Brown's brigade to Pettus's.

On the 9th a much larger force assailed the troops at the angle, and with great determination, but the Federal troops were defeated with a loss proportionate to their courage. Assaults as vigorous and resolute were made at the same time on Stewart and on Bate, and were handsomely repulsed. The Confederates, who fought under cover, had but trifling losses in these combats, but the Federal troops, fully exposed, must have lost heavily—the more because American soldiers are not to be driven back without severe losses. General Wheeler had a very handsome affair of cavalry near Varnell's Station, the same day, in which he captured 100 prisoners, including a colonel, 3 captains, 5 lieutenants, and a standard. General Sherman regarded these actions as amounting to a battle.

Information had been received of the arrival of the Army of the Tennessee in Snake Creek Gap, on the 8th. At night on the 9th General Cantey reported that he had been engaged with those troops until dark. Lieutenant-General Hood was dispatched to Resaca with three divisions immediately. The next morning he reported the enemy retiring, and was recalled, with orders to leave two divisions midway between the two places. Spirited fighting was renewed in and near the gap as well as on the northern front. The most vigorous of them was made late in the day, on Bate's division, and repulsed. At night information was received from our scouts near the south end of Rocky-face, that the Army of the Tennessee was intrenching in Snake Creek Gap, and next morning reports were received which indicated

a general movement of the Federal army to its right, and one report that General McPherson's troops were moving from Snake Creek Gap towards Resaca. General Polk, who had just reached that place with Loring's division, was charged with its defense.

General Wheeler was directed to move next morning with all the available cavalry around the north end of Rocky-face, to learn if a general movement of the enemy was in progress. He was to be supported by Hindman's division. In this reconnaissance, General Stoneman's division of cavalry was encountered and driven back. The information gained confirmed the reports of the day before.

Before 10 A. M. of the 13th, the Confederate army moved from Dalton and reached Resaca just as the Federal troops approaching from Snake Creek Gap were encountering Loring's division a mile from the station. Their approach was delayed long enough by Loring's opposition to give me time to select the ground to be occupied by our troops. And while they were taking this ground, the Federal army was forming in front of them. The left of Polk's corps occupied the west face of the intrenchment of Resaca. Hardee's corps, also facing to the west, formed the center. Hood's, its left division facing to the west and the two others to the north-west, was on the right, and, crossing the railroad, reached the Connesauga. The enemy skirmished briskly with the left half of our line all the afternoon.

On the 14th spirited fighting was maintained by the enemy on the whole front, a very vigorous attack being made on Hindman's division of Hood's corps, which was handsomely repulsed. In the meantime General Wheeler was directed to ascertain the position and formation of the Federal left. His report indicating that they were not unfavorable to an attack, Lieutenant-General Hood was directed to make one with Stewart's and Stevenson's divisions, strengthened by four brigades from the center and left. He was instructed to make a half change of front to the left to drive the enemy from the railroad, the object of the operation being to prevent them from using it. The attack was extremely well conducted and executed, and before dark (it was begun at 6 P. M.) the enemy was driven from his ground. This encouraged me to hope for a more important success; so General Hood was directed to renew the fight next morning. His troops were greatly elated by this announcement, made to them that evening.

On riding from the right to the left after nightfall, I was informed that the extreme left of our line of skirmishers, 40 or 50 men, had been driven from their ground,—an elevation near the river,—and received a report

from Major-General Martin that Federal troops were crossing the Oostenaula near Lay's Ferry on a pontoon bridge—two divisions having already crossed. In consequence of this, Walker's division was sent to Lay's Ferry immediately, and the order to General Hood was revoked; also, Lieutenant-Colonel S. W. Presstman, chief engineer, was directed to lay a pontoon bridge a mile above the railroad, and to have the necessary roadway made.

Sharp fighting commenced early on the 15th, and continued until night, with so much vigor that many of the assailants pressed up to our intrenchments. All these attacks were repelled, however. In General Sherman's language, the sounds of musketry and cannon rose all day to the dignity of a battle.

Soon after noon intelligence was received from Major-General Walker, that the report that the enemy had crossed the Oostenaula was untrue. Lieutenant-General Hood was therefore again ordered to assail the enemy with the troops he had commanded the day before. When he was about to move forward, positive intelligence was received from General Walker that the Federal right was actually crossing the Oostenaula. This made it necessary to abandon the thought of fighting north of the river, and the orders to Lieutenant-General Hood were countermanded, but the order from corps headquarters was not sent to Stewart promptly, and consequently he made the attack unsustained, and suffered before being recalled.

The occupation of Resaca being exceedingly hazardous, I determined to abandon the place. So the army was ordered to cross the Oostenaula about midnight,—Hardee's and Polk's corps by the railroad and trestle-bridges, and Hood's by that above, on the pontoons.

General Sherman claims to have surprised us by McPherson's appearance in Snake Creek Gap on the 9th, forgetting that we discovered his march on the 8th. He blames McPherson for not seizing the place. That officer tried the works and found them too strong to be seized. General Sherman says that if McPherson had placed his whole force astride the railroad, he could have there easily withstood the attack of all Johnston's army. Had he done so "all Johnston's army" would have been upon him at the dawn of the next day, the cannon giving General Sherman intelligence of the movement of that army. About twice his force in front and three thousand men in his immediate rear would have overwhelmed him, making a most auspicious beginning of the campaign, for the Confederates.

General Sherman has a very exaggerated idea of our field works. They were slighter than his own, because we had most inadequate

supplies of intrenching tools. Two events at Resaca were greatly magnified to him. He says that on the 13th McPherson's whole line took possession of a ridge overlooking the town, and that several attempts to drive him away were repulsed with bloody loss. The fact is, near night of the 14th, 40 or 50 skirmishers in front of our extreme left were driven from the slight elevation they occupied, but no attempt was made to retake it; and—"Hooker's corps had also some handsome fighting on the left, capturing a 4-gun intrenched battery." From our view, in the morning of the 15th, Major-General Stevenson advanced 4 guns some 80 yards and began to intrench them. General Hood had their fire opened at once. A ravine leading from the Federal line within easy musket-range enabled the Federal troops to drive away the gunners; but their attempt to take off the guns was frustrated by the Confederate musketry. So the pieces remained in place, and fell into the possession of Hooker's corps on the 16th, after we abandoned the position.

The Confederate army was compelled to abandon its position in front of Dalton by General Sherman's flank movement through Snake Creek Gap, and was forced from the second position by the movement towards Calhoun. Each of these movements would have made the destruction of the Confederate army inevitable in case of defeat. In the first case the flank march was protected completely by Rocky-face Ridge; in the second, as completely by the Oostenaula. A numerical superiority of more than 2 to 1 made those manœuvres free from risk. General Sherman thinks that the impracticable nature of the country which made the passage of the troops across the valley almost impossible, saved the Confederate army. The Confederate army remained in its position near Dalton until May 13th, because I knew the time that would be required for the march of 100,000 men through the long defile between their right flank near Mill Creek Gap and the outlet of Snake Creek Gap; and the shortness of the time in which 43,000 men could march by two good roads direct from Dalton to Resaca; and the further fact that our post at Resaca could hold out a longer time than our march to that point would require.

Mr. Davis and General Sherman exhibit a strange ignorance of the country between Dalton and Atlanta. Mr. Davis describes mountain ridges offering positions neither to be taken nor turned, and a natural fortress eighteen miles in extent, forgetting, apparently, that a fortress is strong only when it has a garrison strong enough for its extent; and both forget that, except Rocky-face, no mountain is visible from the

road between Dalton and Atlanta. That country is intersected by numerous practicable roads, and is not more rugged than that near Baltimore and Washington, or Atlanta and Macon. When the armies confronted each other, the advantages of ground were equal, and unimportant, both parties depending for protection on earthworks, not on ridges and ravines.

In leaving Resaca I hoped to find a favorable position near Calhoun, but there was none; and the army, after resting 18 or 20 hours near that place, early in the morning of the 17th moved on 7 or 8 miles to Adairsville, where we were joined by the cavalry of General Polk's command, a division of 3700 men under General W. H. Jackson. Our map represented the valley in which the railroad lies as narrow enough for our army formed across it to occupy the heights on each side with its flanks, and therefore I intended to await the enemy's attack there; but the breadth of the valley far exceeded the front of our army in order of battle. So another plan was devised. Two roads lead southward from Adairsville,—one directly through Cassville; the other follows the railroad through Kingston, turns to the left there, and rejoins the other at Cassville. The interval between them is widest opposite Kingston, where it is about seven miles by the farm roads. In the expectation that a part of the Federal army would follow each road, it was arranged that Polk's corps should engage the column on the direct road when it should arrive opposite Kingston,—Hood's, in position for the purpose, falling upon its left flank in the deployment. Next morning, when our cavalry on that road reported the right Federal column near Kingston, General Hood was instructed to move to and follow northwardly a country road a mile east of that from Adairsville, to be in position to fall upon the flank of the Federal column when it should be engaged with Polk. An order announcing that we were about to give battle was read to each regiment, and heard with exultation. After going some three miles, General Hood marched back about two, and formed his corps facing to our right and rear. Being asked for an explanation, he replied that an aide-de-camp had told him that the Federal army was approaching on that road. Our whole army knew that to be impossible. It had been viewing the enemy in the opposite direction every day for two weeks. General Hood did not report his extraordinary disobedience—as he must have done had he believed the story upon which he professed to have acted. The time lost frustrated the design, for success depended on timing the attack properly.

Mr. Davis conceals the facts to impute this failure to me, thus: "The battle, for causes which were the subject of dispute, did not

take place. . . . Instead of his attacking the divided columns of the enemy, the united Federal columns were preparing to attack him." There was no dispute as to facts.

An attack, except under very unfavorable circumstances, being impossible, the troops were formed in an excellent position along the ridge immediately south of Cassville, an elevated and open valley in front, and a deep one in rear of it. Its length was equal to the front of Hood's and Polk's and half of Hardee's corps. They were placed in that order from right to left.

As I rode along the line while the troops were forming, General Shoup, chief of artillery, pointed out to me a space of 150 or 200 yards, which he thought might be enfiladed by artillery on a hill a half mile beyond Hood's right and in front of the prolongation of our line, if the enemy should clear away the thick wood that covered it and establish batteries. He was desired to point out to the officer who might command there some narrow ravines very near, in which his men could be sheltered from such artillery fire, and to remind him that while artillery was playing upon his position no attack would be made upon it by infantry. The enemy got into position soon after our troops were formed and skirmished until dark, using their field-pieces freely. During the evening Lieutenant-Generals Polk and Hood, the latter being spokesman, asserted that a part of the line of each would be so enfiladed next morning by the Federal batteries established on the hill above mentioned, that they would be unable to hold their ground an hour; and therefore urged me to abandon the position at once. The matter was discussed perhaps an hour, in which time I became apprehensive that as the commanders of two-thirds of the army thought the position untenable, the opinion would be adopted by their troops, which would make it so. Therefore I yielded. Lieutenant-General Hardee, whose ground was the least strong, was full of confidence. Mr. Davis says ("Rise and Fall," page 533) that General Hood asserts, in his report and in a book, that the two corps were on ground commanded and enfiladed by the enemy's batteries. On the contrary, they were on a hill, and the enemy in a valley where their batteries were completely commanded by ours. They expressed the conviction that early the next morning batteries would open upon them from a hill *then thickly covered with wood and out of range of brass field-pieces.*

The army abandoned the ground before daybreak and crossed the Etowah after noon, and encamped near the railroad. Wheeler's cavalry was placed in observation above, and Jackson's below our main body.

No movement of the enemy was discovered until the 22d, when General Jackson reported their army moving towards Stilesboro', as if to cross the Etowah near that place, and crossing on the 23d. On the 24th Hardee's and Polk's corps encamped on the road from Stilesboro' to Atlanta south-east of Dallas, and Hood's four miles from New Hope Church, on the road from Allatoona. On the 25th the Federal army was a little east of Dallas, and Hood's corps was placed with its center at New Hope Church, Polk's on his left and Hardee's prolonging the line to the Atlanta road, which was held by its left. A little before 6 o'clock in the afternoon Stewart's division in front of New Hope Church was fiercely attacked by Hooker's corps, and the action continued two hours without lull or pause, when the assailants fell back. The canister shot of the 16 Confederate field-pieces and the musketry of 5000 infantry at short range must have inflicted heavy loss upon General Hooker's corps, as is proved by the name "Hell Hole," which, General Sherman says, was given the place by the Federal soldiers. Next day the Federal troops worked so vigorously, extending their intrenchments towards the railroad, that they skirmished very little. The Confederates labored strenuously to keep abreast of their work, but in vain, from greatly inferior numbers and an insignificant supply of intrenching tools. On the 27th, however, the fighting rose above the grade of skirmishing, especially in the afternoon, when at half-past 5 o'clock the Fourth Corps and a division of the Fourteenth attempted to turn our right, but the movement, after being impeded by the cavalry, was met by two regiments of our right division (Cleburne's) and the two brigades of his second line brought up on the right of the first. The Federal formation was so deep that its front did not equal that of our two brigades; consequently those troops were greatly exposed to our musketry — all but the leading troops being on a hillside facing us. They advanced until their first line was within 25 or 30 paces of ours, and fell back only after at least 700 men had fallen dead in their places. When the leading Federal troops paused in their advance, a color-bearer came on, and planted his colors 8 or 10 feet in front of his regiment, but was killed in the act. A soldier who sprang forward to hold up or bear off the colors was shot dead as he seized the staff. Two others who followed successively, fell like him, but a fourth bore back the noble emblem. Some time after nightfall, the Confederates captured above two hundred prisoners in the hollow before them.

General Sherman does not refer to this combat in his "Memoirs," although he dwells with some exultation upon a very small affair

of the next day at Dallas, in which the Confederates lost about 300 men killed and wounded, and in which he must have lost more than ten times as many.

In the afternoon of the 28th, Lieutenant-General Hood was instructed to draw his corps to the rear of our line in the early part of the night, march around our right flank, and form it facing the left flank of the Federal line and obliquely to it, and attack at dawn — Hardee and Polk to join in the battle successively as the success on the right of each might enable him to do so. We waited next morning for the signal, — the sound of Hood's musketry, — from the appointed time until 10 o'clock, when a message from that officer was brought by an aide-de-camp to the effect that he had found R. W. Johnson's division intrenching on the left of the Federal line and almost at right angles to it, and asked for instructions. The message proved that there could be no surprise, which was necessary to success, and that the enemy's intrenchments would be completed before we could attack. The corps was therefore recalled. It was ascertained afterwards that after marching eight or ten hours Hood's corps was then at least six miles from the Federal left, which was but a musket-shot from his starting-point.

The extension of the Federal intrenchments towards the railroad was continued industriously to cut us off from it or to cover their own approach to it. We tried to keep pace with them, but the labor did not prevent the desultory fighting, which was kept up while daylight lasted. In this the great inequality of force compelled us to employ dismounted cavalry. On the 4th or 5th of June the Federal army reached the railroad between Ackworth and Allatoona. The Confederate forces then moved to a position carefully marked out by Colonel Presstman, its left on Lost Mountain, and its right of cavalry beyond the railroad and somewhat covered by Noonday Creek, a line much too long for our strength.

On the 8th the Federal army seemed to be near Ackworth, and our position was contracted to cover the roads leading thence to Atlanta. This brought the left of Hardee's corps to Gilgal Church, Polk's right near the Marietta and Ackworth road and Hood's corps massed beyond that road. Pine Mountain, a detached hill, was held by a division. On the 11th of June the left of the Federal army was on the high ground beyond Noonday Creek, its center a third of a mile in front of Pine Mountain and its right beyond the Burnt Hickory and Marietta road.

In the morning of the 14th General Hardee and I rode to the summit of Pine Mountain to decide if the outpost there should be main-

CHARACTER OF THE BATTLE-FIELD OF NEW HOPE CHURCH. (FROM A PHOTOGRAPH.)

tained. General Polk accompanied us. After we had concluded our examination and the abandonment of the hill had been decided upon, a few shots were fired at us from a battery of Parrott guns a quarter of a mile in our front; the third of these passed through General Polk's chest, from left to right, killing him instantly. This event produced deep sorrow in the army, in every battle of which he had been distinguished. Major-General W. W. Loring succeeded to the command of the corps.

A division of Georgia militia under Major-General G. W. Smith, transferred to the Confederate service by Governor Brown, was charged with the defense of the bridges and ferries of the Chattahoochee, for the safety of Atlanta. On the 16th Hardee's corps was placed on the high ground east of Mud Creek, facing to the west. The right of the Federal army made a corresponding change of front by which it faced to the east. It was opposed in this manœuvre by Jackson's cavalry, as well as 2500 men can resist 30,000. The angle where Hardee's right joined Loring's left was soon found to be a very weak point, and on the 17th another position was chosen, including the crest of Kennesaw, which Colonel Pressman prepared for occupation by the 19th, when it was assumed by the army. In this position two divisions of Loring's corps occupied the crest of Kennesaw from end to end, the other division being on its right, and Hood's

corps on the right of it, Hardee's extending from Loring's left across the Lost Mountain and Marietta road. The enemy approached as usual, under cover of successive lines of intrenchments. In these positions of the two armies partial engagements were sharp and incessant until the 3d of July. On the 21st the extension of the Federal line to the south which had been protected by the swollen condition of Noses Creek, compelled the transfer of Hood's corps to our left, Wheeler's troops occupying the ground it had left. On the 22d General Hood reported that Hindman's and Stevenson's divisions of his corps, having been attacked, had driven back the Federal troops and had taken a line of breastworks, from which they had been driven by the artillery of the enemy's main position. Subsequent detailed accounts of this affair prove that after the capture of the advanced line of breastworks, General Hood directed his two divisions against the enemy's main line. The slow operation of a change of front under the fire of the artillery of this main line, subjected the Confederates to a loss of one thousand men—whereupon the attempt was abandoned, either by the general's orders or the discretion of the troops.

On the 24th Hardee's skirmishers were attacked in their rifle-pits by a Federal line of battle, and on the 25th a similar assault was made upon those of Stevenson's division. Both

were repulsed, with heavy losses to the assailants.

In the morning of the 27th, after a cannonade by all its artillery, the Federal army assailed the Confederate position, especially the center and right — the Army of the Cumberland advancing against the first, and that of the Tennessee against the other. Although suffering losses out of all proportion to those they inflicted, the Federal troops pressed up to the Confederate intrenchments in many places, maintaining the unequal conflict for two hours and a half, with the persevering courage of American soldiers. At 11:30 A. M. the attack had failed. In General Sherman's words:

"About 9 o'clock A. M. of the day appointed, June the 27th, the troops moved to the assault, and all along our lines for ten miles a furious fire of artillery and musketry was kept up. At all points the enemy met us with determined courage and in great force. . . . By 11:30 the assault was over, and had failed. We had not broken the Confederate line at either point, but our assaulting columns held their ground within a few yards of the rebel trenches and there covered themselves with parapet. McPherson lost about 300 men, and Thomas nearly 2000." [He reports 1580. See Report of Com. on Conduct of War — Supplement.]

Such statements of losses are incredible. The Northern troops fought very bravely, as usual. Many fell against our parapets, some were killed in our trenches. Most of this battle of $2\frac{1}{2}$ hours was at very short range. It is not to be believed that Southern veterans struck but 3 per cent. of Thomas's troops in mass at short range, or $1\frac{2}{3}$ per cent. of McPherson's — and if possible still less so that Northern soldiers, inured to battle, should have been defeated by losses so trifling as never to have discouraged the meanest soldiers on record. I have seen American soldiers (Northern men) win a field with losses ten times greater proportionally. But argument apart, there is a witness against the estimates of Northern losses in this campaign, in the 10,036 graves in the Military Cemetery at Marietta, of soldiers killed south of the Etowah. Moreover, the Federal dead nearest to Hardee's line lay there 2 days, during which they were frequently counted — at least 1000; and as there were 7 lines within some 300 yards, exposed $2\frac{1}{2}$ hours to the musketry of 2 divisions and the canister shot of 32 field-pieces, there must have been many uncounted dead; the counted would alone indicate a loss of at least 6000.

As to the "assaulting columns holding their ground within a few yards of the rebel trenches and there covering themselves with parapet," it was utterly impossible. There would have been much more exposure in that than in mounting and crossing the little rebel "parapet"; but at one point 75 yards in front of Cheatham's line, a party of Federal soldiers,

finding themselves sheltered from his missiles by the form of the ground, made a "parapet" there which became connected with the main work.

As the extension of the Federal intrenched line to their right had brought *it* nearer to Atlanta than was our left, and had made our position otherwise very dangerous, two new positions for the army were chosen, one 9 or 10 miles south of Marietta, and the other on the high ground near the Chattahoochee. Colonel Presstman was desired to prepare the first for occupation, and Brigadier-General Shoup, commander of the artillery, was instructed to strengthen the other with a line of redoubts devised by himself.

The troops took the first position in the morning of the 3d, and as General Sherman was strengthening his right greatly, they were transferred to the second in the morning of the 5th. The cavalry of our left had been supported in the previous few days by a division of State troops commanded by Major-General G. W. Smith.

As General Sherman says, "it was really a continuous battle lasting from June 10th to July 3d." The army occupied positions about Marietta 26 days, in which the want of artillery ammunition was especially felt; for, in all those days we were exposed to an almost incessant fire of artillery as well as musketry — the former being the more harassing, because it could not be returned; for our supply of artillery ammunition was so small that we were compelled to reserve it for battles and serious assaults.

In the new position, each corps had two pontoon bridges laid. Above the railroad bridge the Chattahoochee had numerous good fords. General Sherman, therefore, directed his troops to that part of the river, 10 or 15 miles above our camp. On the 8th of July two of his corps had crossed the Chattahoochee and intrenched themselves. Therefore the Confederate army also crossed the river on the 9th.

About the middle of June Captain Grant of the engineers was instructed to strengthen the fortifications of Atlanta materially, on the side towards Peach Tree Creek, by the addition of redoubts and by converting barbette into embrasure batteries. I also obtained a promise of seven sea-coast rifles from General Maury, to be mounted on that front. Colonel Presstman was instructed to join Captain Grant with his subordinates, in this work of strengthening the defenses of Atlanta, especially between the Augusta and Marietta roads, as the enemy was approaching that side. For the same reason a position on the high ground looking down into the valley of Peach Tree Creek was selected for the army, from which

it might engage the enemy if he exposed himself in the passage of the stream. The position of each division was marked and pointed out to its staff-officers.

We learned on the 17th that the whole Federal army had crossed the Chattahoochee; and late in the evening, while Colonel Presstman was receiving from me instructions for the next day, I received the following telegram of that date:

"Lieutenant General J. B. Hood has been commissioned to the temporary rank of general under the late law of Congress. I am directed by the Secretary of War to inform you that, as you have failed to arrest the advance of the enemy to the vicinity of Atlanta, and express no confidence that you can defeat or repel him, you are hereby relieved from the command of the Army and Department of Tennessee, which you will immediately turn over to General Hood.

"S. COCKER, Adjutant and Inspector-General."

Orders transferring the command of the army to General Hood were written and published immediately, and next morning I replied to the telegram of the Secretary of War:

"Your dispatch of yesterday received and obeyed—command of the Army and Department of Tennessee has been transferred to General Hood. As to the alleged cause of my removal, I assert that Sherman's army is much stronger compared with that of Tennessee, than Grant's compared with that of Northern Virginia. Yet the enemy has been compelled to advance much more slowly to the vicinity of Atlanta than to that of Richmond and Petersburg; and penetrated much deeper into Virginia than into Georgia. Coasting language by a military commander is not usually regarded as evidence of competence."

General Hood came to my quarters early in the morning of the 18th, and remained there until nightfall. Intelligence was soon received that the Federal army was marching towards Atlanta, and at his urgent request I gave all necessary orders during the day. The most important one placed the troops in the position already chosen, which covered the roads by which the enemy was approaching. After transferring the command to General Hood I described to him the course of action I had arranged in my mind. If the enemy should give us a good opportunity in the passage of Peach Tree Creek, I expected to attack him. If successful, we should obtain important results, for the enemy's retreat would be on two sides of a triangle and our march on one. If we should not succeed, our intrenchments would give us a safe refuge, where we could hold back the enemy until the promised State troops should join us; then, placing them on the nearest defenses of the place (where there were, or ought to be, seven sea-coast rifles, sent us from Mobile by General Maury), I would attack the Federals in flank with the

three Confederate corps. If we were successful, they would be driven against the Chattahoochee below the railroad, where there are no fords, or away from their supplies, as we might fall on their left or right flank. If unsuccessful, we could take refuge in Atlanta, which we could hold indefinitely; for it was too strong to be taken by assault, and too extensive to be invested. This would win the campaign, the object of which the country supposed Atlanta to be.

At Dalton, the great numerical superiority of the enemy made the chances of battle much against us, and even if beaten they had a safe refuge behind the fortified pass of Ringgold and in the fortress of Chattanooga. Our refuge, in case of defeat, was in Atlanta, 100 miles off, with 3 rivers intervening. Therefore victory for us could not have been decisive, while defeat would have been utterly disastrous. Between Dalton and the Chattahoochee we could have given battle only by attacking the enemy intrenched, or so near intrenchments that the only result of success to us would have been his falling back into them, while defeat would have been our ruin.

In the course pursued our troops, always fighting under cover, had very trifling losses compared with those they inflicted, so that the enemy's numerical superiority was reduced daily and rapidly; and we could reasonably have expected to cope with them on equal ground by the time the Chattahoochee was passed. Defeat on the south side of that river would have been their destruction. We, if beaten, had a place of refuge in Atlanta—too strong to be assaulted, and too extensive to be invested. I had also hoped that by the breaking of the railroad in its rear the Federal army might be compelled to attack us in a position of our own choosing, or forced into a retreat easily converted into a rout. After we crossed the Etowah, five detachments of cavalry were successively sent with instructions to destroy as much as they could of the railroad between Chattanooga and the Etowah. All failed, because they were too weak. Captain James B. Harvey, an officer of great courage and sagacity, was detached on this service on the 11th of June and remained near the railroad several weeks frequently interrupting, but not strong enough to prevent, its use.

Early in the campaign the impressions of the strength of the cavalry in Mississippi and East Louisiana given me by Lieutenant-General Polk, just from the command of that department, gave me reason to hope that an adequate force commanded by the most com-

* I have two reports of the strength of the army besides that of April 30th, already given: 1. Of July 1st, 39,746 infantry, 3855 artillery, and 10,484 cavalry; total, 54,085. 2. Of July 10th, 36,901 infantry, 3755 artillery and 10,270 cavalry; total, 50,926.—J. E. J.

petent officer in America for such service (General Forrest) could be sent from it for the purpose. I therefore made the suggestion to the President directly, June 13th and July 16th, and through General Bragg on the 3d, 12th, 16th, and 26th of June. I did so in the confidence that this cavalry would serve the Confederacy far better by insuring the defeat of a great invasion than by repelling a mere raid.

In his telegram of the 17th, Mr. Davis gave his reasons for removing me, but in pages 556 to 561 of the "Rise and Fall" he gives many others, most of which depend on misrepresentations of the strength of the positions I occupied. They were not stronger than General Lee's; indeed, my course was as like his as the dissimilarity of the two Federal commanders permitted. As his had increased his great fame, it is not probable that the people who admired his course condemned another similar one. As to Georgia, the State most interested, its two most prominent and influential citizens, Governor Joseph E. Brown (now Senator) and General Howell Cobb, remonstrated against my removal.

The assertions in Mr. B. H. Hill's letter quoted by Mr. Davis do not agree with those in his oration delivered in Atlanta in 1875. He said in it: "I know that he (Mr. Davis) consulted General Lee fully, earnestly, and anxiously before this perhaps unfortunate removal." That assertion is contradicted by one whose testimony is above question — for in

Southern estimation he has no superior as gentleman, soldier, and civilian — General Hampton. General Lee had a conversation with him on the subject, of which he wrote to me:

"On that occasion he expressed great regret that you had been removed, and said that he had done all in his power to prevent it. The Secretary of War had recently been at his headquarters near Petersburg to consult as to this matter, and General Lee assured me that he had urged Mr. Seddon not to remove you from command, and had said to him that if you could not command the army we had no one who could. He was earnest in expressing not only his regret at your removal, but his entire confidence in yourself."

Everything seen about Atlanta proved that it was to be defended. We had been strengthening it a month, and had made it, under the circumstances, impregnable. We had defended Marietta, which had not a tenth of its strength, 26 days. General Sherman appreciated its strength, for he made no attack, although he was before it about six weeks.

I was a party to no such conversations as those given by Mr. Hill. No soldier above idiocy could express the opinions he ascribes to me.

Mr. Davis condemned me for not fighting. General Sherman's testimony and that of the Military Cemetery at Marietta refute the charge.

I assert that had one of the other lieutenant-generals of the army (Hardee or Stewart) succeeded me, Atlanta would have been held by the Army of Tennessee.

J. E. Johnston.

MAP OF HOOD'S INVASION OF TENNESSEE.

THE LEVEE AT NASHVILLE, LOOKING DOWN THE CUMBERLAND. FROM A WAR-TIME PHOTOGRAPH.

HOOD'S INVASION OF TENNESSEE.

BRIDGE OVER THE CUMBERLAND AT NASHVILLE.

On September 28th, 1864, less than four weeks from the day the Union forces occupied Atlanta, General Sherman, who found his still unconquered enemy, General Hood, threatening his communications in Georgia, and that formidable raider, General Forrest, playing the mischief in Tennessee, sent to the latter State two divisions — General Newton's of the Fourth Corps, and General J. D. Morgan's of the Fourteenth — to aid in destroying, if possible, that intrepid dragoon. To make assurance doubly sure, the next day he ordered General George H. Thomas, his most capable and experienced lieutenant, and the commander of more than three-fifths of his grand army, "back to Stevenson and Decherd . . . to look to Tennessee."

No order would have been more unwelcome to General Thomas. It removed him from the command of his own thoroughly organized and harmonious army, 60,000 veterans, whom he knew and trusted, and who knew and loved him, and relegated him to the position of supervisor of communications. It also sent him to the rear, just when great preparations were making for an advance. But, as often happens,

what seemed an adverse fate opened the door to great, unforeseen opportunity. The task of expelling Forrest and reopening the broken communications was speedily completed; and on the 17th of October General Thomas wrote to General Sherman: "I hope to join you very soon." The latter, however, had other views, and the hoped-for junction was never made. On the 19th he wrote to General Thomas:

"I will send back to Tennessee the Fourth Corps, all dismounted cavalry, all sick and wounded, and all incumbrances whatever, except what I can haul in our wagons. . . . I want you to remain in Tennessee and take command of all my [military] division not actually present with me. Hood's army may be set down at forty thousand (40,000) of all arms, fit for duty. . . . If you can defend the line of the Tennessee in my absence of three (3) months it is all I ask."

With such orders, and under such circumstances, General Thomas was left to play his part in the new campaign.

General Hood, after a series of daring adventures, which baffled all Sherman's calculations ("he can turn and twist like a fox," said Sherman, "and wear out my army in pursuit"), concentrated his entire force, except Forrest's cavalry, at Gadsden, Alabama, on the 22d of October; while General Sherman established his headquarters at Gaylesville, — a "position," as he wrote to General Halleck, "very good to watch the enemy." In spite of this "watch," Hood suddenly appeared on the 26th at Decatur, on the Tennessee River, 75 miles northwest of Gadsden. This move was a complete surprise, and evidently "meant business."

The Fourth Corps, numbering about 12,000 men, commanded by Major-General D. S. Stanley, was at once ordered from Gaylesville, to report to General Thomas. Its leading division reached Pulaski, Tenn., a small town on

LIEUTENANT-GENERAL N. B. FORREST, C. S. A.
(FROM A PHOTOGRAPH.)

the railroad, about 40 miles north of Decatur, on the 1st of November, where it was joined four days later by the other two.

Making a slight though somewhat lengthened demonstration against Decatur, General Hood pushed on to Tusculum, 45 miles west. Here he expected to find — what he had weeks before ordered — ample supplies, and the railroad in operation to Corinth. But he was doomed to disappointment. Instead of being in condition to make the rapid and triumphant march with which he had inflamed the ardor of his troops, he was detained three weeks, a delay fatal to his far-reaching hopes. Placing one corps on the north side of the river at Florence, he worked and waited for supplies and for Forrest, who had been playing havoc in West Tennessee, and was under orders to join him.

Convinced now of Hood's serious intentions, General Sherman also ordered the Twenty-third Corps, ten thousand men, under command of Major-General J. M. Schofield, to report to General Thomas. Reaching Pulaski, with one division on the 14th of November, General Schofield, though inferior in rank to Stanley, assumed command by virtue of being a department commander. The whole force gathered there was less than 18,000 men; while in

front were some 5000 cavalry, consisting of a brigade of about 1500, under General Croxton, and a division of some 3500, under General Edward Hatch, the latter being fortunately intercepted while on his way to join Sherman.

The Confederate army in three corps (S. P. Lee's, A. P. Stewart's, and B. F. Cheatham's) began its northward march on the 19th of November, in the midst of weather of great severity. It rained and snowed and hailed and froze, and the roads were almost impassable. Forrest had come up, with about 6000 cavalry, and led the advance with indomitable energy. Hatch and Croxton made such resistance as they could; but on the 22d, the head of Hood's column was at Lawrenceburg, some 16 miles due west of Pulaski, and on a road running direct to Columbia, where the railroad and turnpike to Nashville cross Duck River, and where there were less than 800 men to guard the bridges. The situation at Pulaski, with an enemy nearly three times as large fairly on the flank, was anything but cheering. Warned by the reports from General Hatch, and by the orders of General Thomas, who, on the 20th, had directed General Schofield to prepare to fall back to Columbia, the two divisions of General J. D. Cox and General Wagner (the latter Newton's old division) were ordered to march to Lynnville — about half-way to Columbia — on the 22d. On the 23d, the other two divisions, under General Stanley, were to follow with the wagon trains. It was not a moment too soon. On the morning of the 24th, General Cox, who had pushed on to within nine miles of Columbia, was roused by sounds of conflict away to the west. Taking a cross-road, leading south of Columbia, he reached the Mount Pleasant pike just in time to interpose his infantry between Forrest's cavalry and a hapless brigade, under command of Colonel Capron, which was being handled most unceremoniously. In another hour, Forrest would have been in possession of the crossings of Duck River; and the only line of communication with Nashville would have been in the hands of the enemy. General Stanley, who had left Pulaski in the afternoon of the 23d, reached Lynnville after dark. Rousing his command at 1 o'clock in the morning, by 9 o'clock the head of his column connected with Cox in front of Columbia — having marched 30 miles since 2 o'clock of the preceding afternoon. These timely movements saved the army from utter destruction.

When General Sherman had finally determined on his march to the sea, he requested General Rosecrans, in Missouri, to send to General Thomas two divisions, under General A. J. Smith, which had been loaned to General Banks for the Red River expedition, and were

now repelling the incursion of Price into Missouri. As they were not immediately forthcoming, General Grant had ordered General Rawlins, his chief-of-staff, to St. Louis, to direct, in person, their speedy embarkation. Thence, on the 7th, two weeks before Hood began his advance from Florence, General Rawlins wrote to General Thomas that Smith's command, aggregating nearly 14,000, would begin to leave that place as early as the 10th. No news was ever more anxiously awaited or more eagerly welcomed than this. But the promise could not be fulfilled. Smith had to march entirely across the State of Missouri, and instead of leaving St. Louis on the 10th, he did not reach that place until the 24th. Had he come at the proposed time, it was General Thomas's intention to place him at Eastport, on the Tennessee River, so as to threaten Hood's flank and rear if he advanced. With such disposition, the battles of Franklin and Nashville would have been relegated to the category of "events which never come to pass." But, when Smith reached St. Louis, Hood was threatening Columbia; and it was an open question whether he would not reach Nashville before the reinforcements from Missouri.

As fast as the Union troops arrived at Columbia, in their hurried retreat from Pulaski, works were thrown up, covering the approaches from the south, and the trains were sent across

MAJOR-GENERAL JOHN M. SCHOFIELD. (FROM A PHOTOGRAPH.)

the river. But the line was found to be longer than the small force could hold; and the river could easily be crossed, above or below the town. Orders were given to withdraw to the north side on the night of the 26th, but a heavy storm prevented. The next night the crossing was made, the railroad bridge was burned, and the pontoon boats were scuttled. It was an all-night job, the last of the pickets crossing at 5 in the morning. It was now the fifth day since the retreat from Pulaski began, and the little army had been exposed day and night to all sorts of weather except sunshine, and had been almost continually on the move. From deserters it was learned that Hood's infantry numbered 40,000 and his cavalry, under Forrest, 10,000 or 12,000. But the Union army was slowly increasing by concentration and the arrival of recruits. It now numbered at Columbia about 23,000 infantry and some 5000 cavalry — of whom only 3500 were mounted. General J. H. Wilson, who had been ordered by General Grant to report to General Sherman, and of whom General Grant wrote, "I believe he will add fifty per cent. to the effectiveness of your cavalry," had taken command of all General Thomas's cavalry, which was trying to hold the fords east and west of Columbia.

In spite of every opposition, Forrest suc-

LIEUTENANT-GENERAL E. F. HEATH, U. S. A. (FROM A PHOTOGRAPH.)

MAJOR-GENERAL JAMES H. WILSON. (FROM A PHOTOGRAPH.)

ceeded in placing one of his divisions on the north side of Duck River before noon of the 28th, and forced back the Union cavalry on roads leading toward Spring Hill and Franklin. At 1 o'clock on the morning of the 29th General Wilson became convinced that the enemy's infantry would begin crossing at daylight, and advised General Schofield to fall back to Franklin. At 3:30 the same morning General Thomas sent him similar orders. Daylight revealed the correctness of Wilson's information. Cheatham's corps, headed by Cleburne's division,—a division unsurpassed for courage, energy, and endurance by any other in the Confederate army,—before sunrise was making its way over Duck River at Davis's Ford, about five miles east of Columbia. The weather had cleared, and it was a bright autumn morning, the air full of invigorating life. General Hood in person accompanied the advance.

When General Schofield was informed that the Confederate infantry were crossing, he sent a brigade under Colonel P. Sidney Post, on a reconnaissance along the river bank, to learn what was going on. He also ordered General Stanley to march with two divisions, Wagner's and Kimball's, to Spring Hill, taking the trains and all the reserve artillery. In less than half an hour after receiving the order,

Stanley was on the way. On reaching the point where Rutherford Creek crosses the Franklin Pike, Kimball's division was halted, by order of General Schofield, and faced to the east to cover the crossing against a possible attack from that quarter. In this position Kimball remained all day. Stanley, with the other division, pushed on to Spring Hill. Just before noon, as the head of his column was approaching that place, he met "a cavalry soldier who seemed to be badly scared," who reported that Buford's division of Forrest's cavalry was approaching from the east. The troops were at once double-quickened into the town, and the leading brigade, deploying as it advanced, drove off the enemy just as they were expecting, unmolested, to occupy the place. As the other brigades came up, they also were deployed, forming nearly a semicircle,—Opdycke's brigade stretching in a thin line from the railroad station north of the village to a point some distance east, and Lane's from Opdycke's right to the pike below. Bradley was sent to the front to occupy a knoll some three-fourths of a mile east, commanding all the

approaches from that direction. Most of the artillery was placed on a rise south of the town. The trains were parked within the semicircle.

MAJOR-GENERAL JACOB D. COX. (FROM A PHOTOGRAPH.)

From Spring Hill roads radiate to all points, the turnpike between Columbia and Franklin being there intersected by turnpikes from Rally Hill and Mount Carmel, as well as by numerous dirt roads leading to the neighboring towns. Possession of that point would not only shut out the Union army from the road to Nashville, but it would effectually bar the way in every direction. Stanley's arrival was not a moment too soon for the safety of the army under Schofield, and his prompt dispositions and steady courage, as well as his vigorous hold of all the ground he occupied, gave his little command all the moral fruits of a victory.

Hardly had the three brigades, numbering, all told, less than 4000 men, reached the positions assigned them, when Bradley was assailed by a force which the men declared fought too well to be dismounted cavalry. At the same time, at Thompson's Station, three miles north, an attack was made on a small wagon train heading for Franklin; and a dash was made by a detachment of the Confederate cavalry on the Spring Hill station, northwest of the town. It seemed as if the little band, attacked from all points, was threatened with destruction. Bradley's brigade was twice assaulted, but held its own, though with considerable loss, and only a single regiment could be spared to reinforce him. The third assault was more successful, and he was driven back to the edge of the village, Bradley himself receiving a disabling wound while rallying his men. In attempting to follow up this temporary advantage, the enemy, in crossing a wide corn-field, was opened upon with spherical case-shot from eight guns, posted on the knoll, and soon scattered in considerable confusion. These attacks undoubtedly came from Cleburne's division, and were made under the eye of the corps commander, General Cheatham, and the army commander, General Hood. That they were not successful, especially as the other two divisions of the same corps, Brown's and Bate's, were close at hand, and Stewart's corps not far off, seems unaccountable. Except this one small division deployed in a long thin line to cover the wagons, there were no Union troops within striking distance; the cavalry were about Mount Carmel, five miles east, fully occupied in keeping Forrest away from Franklin and the Harpeth River crossings. The nearest aid was Kimball's division, seven miles south, at Rutherford Creek. The other three divisions of infantry which made up Schofield's force—Wood's, Cox's, and Ruger's (in part)—were

still at Duck River. Thus night closed down upon the solitary division, on whose boldness of action devolved the safety of the whole force which Sherman had spared from his march to the sea to breast the tide of Hood's invasion.

MAJOR-GENERAL A. J. SMITH. (FROM A PHOTOGRAPH.)

When night came, the danger rather increased than diminished. A single Confederate brigade, like Adams's or Cockrell's or Maney's,—veterans since Shiloh,—planted square across the pike, either south or north of Spring Hill, would have effectually prevented Schofield's retreat, and daylight would have found his whole force cut off from every avenue of escape by more than twice its numbers, to assault whom would be madness, and to avoid whom would be impossible.

Why Cleburne and Brown failed to drive away Stanley's one division before dark; why Bate failed to possess himself of the pike south of the town; why Stewart failed to lead his troops to the pike at the north; why Forrest, with his audacious temper and his enterprising cavalry, did not fully hold Thompson's Station or the crossing of the West Harpeth, half-way to Franklin: these are to this day disputed questions among the Confederate commanders; and it is not proposed here to discuss them. The afternoon and night of November 29th, 1864, may well be set down in the calendar of lost opportunities. The heroic valor of those same troops the next day, and their frightful losses, as they attempted to

Franklin, to telegraph the situation to General Thomas, with whom all communication had been cut off since early morning. Captain Twining's dispatch shows most clearly the critical condition of affairs. "The general says he will not be able to get farther than Thompson's Station to-night. . . . He regards his situation as extremely perilous. . . . Thinking the troops under A. J. Smith's command had reached Franklin, General Schofield directed me to have them pushed down to Spring Hill by daylight tomorrow." This was Tuesday. The day before, General Thomas had telegraphed to General Schofield that Smith had not yet arrived, but would

retrieve their mistake, show what might have been.

By 8 o'clock at night—two hours only after sunset, of a moonless night—at least two corps of Hood's army were in line of battle facing the turnpike, and not half a mile away. The long line of Confederate camp-fires burned brightly, and their men could be seen, standing around them, or sauntering about in groups. Now and then a few would come almost to the pike and fire at a passing Union squad, but without provoking a reply. General Schofield, who had remained at Duck River all day, reached Spring Hill about 7 P. M., with Ruger's division and Whitaker's brigade. Leaving the latter to cover a cross-road a mile or two below the town, he started with Ruger about 9 P. M. to force a passage at Thompson's Station, supposed to be in the hands of the enemy. At 11 P. M. General Cox arrived with his division, and soon after Schofield returned to Spring Hill with the welcome news that the way was open. From Thompson's Station he sent his engineer officer, Captain Wm. J. Twining, to

be at Nashville in three days—that is, Thursday. The expectation, therefore, of finding him at Franklin, was like a drowning man's catching at a straw.

Just before midnight Cox started from Spring Hill for Franklin, and was ordered to pick up Ruger at Thompson's Station. At 1 A. M. he was on the road, and the train, over five miles long, was drawn out. At the very outset, it had to cross a bridge in single file. So difficult was this whole movement, that it was 5 o'clock in the morning before the wagons were fairly under way. As the head of the train passed Thompson's Station, it was attacked by the Confederate cavalry, and for a while there was great consternation. Wood's division, which had followed Cox from Duck River, was marched along the east of the pike, to protect the train, and the enemy were speedily driven off. It was near daybreak when the last wagon left Spring Hill. Kimball's division followed Wood's, and at 4 o'clock Wagner drew in his lines, his skirmishers remaining till it was fairly daylight. The rear-guard

was commanded by Colonel Emerson Opdycke, who was prepared, if necessary, to sacrifice the last man to secure the safety of the main body. So efficiently did his admirable brigade do its work, that, though surrounded by a cloud of the enemy's cavalry, which made frequent dashes at its lines, not a straggler nor a wagon was left behind. The ground was strewn with knapsacks, cut from the shoulders of a lot of raw recruits, weighed down with their unaccustomed burden.

The head of the column, under General Cox, reached the outskirts of Franklin about the same hour that the rear-guard was leaving Spring Hill. Here the tired, sleepy, hungry men, who had fought and marched, day and night, for nearly a week, threw up a line of earthworks on a slight eminence which guards the southern approach to the town, even before they made their coffee. Then they gladly dropped anywhere, for the much-needed "forty winks." Slowly the rest of the weary column, regiment after regiment of worn-out men, filed into the works, and continued the line, till a complete bridge-head, from the river bank above to the river bank below, encircled the town. By noon of the 30th, all the troops had come up, and the wagons were crossing the river, which was already fordable, notwithstanding the recent heavy rainfalls. The rear-guard was still out, having an occasional bout with the enemy.

The Columbia Pike bisected the works, which at that point were built just in front of the Carter house, a one-story brick dwelling west of the pike, and a large gin-house on the east side. Between the gin-house and the river, the works were partly protected in front by a hedge of osage orange, and on the knoll, near the railroad cut close to the

bank, were two batteries belonging to the Fourth Corps. Near the Carter house was a considerable thicket of locust trees. Except these obstructions, the whole ground in front was entirely unobstructed and fenceless, and, from the works, every part of it was in plain sight. General Cox's division of three brigades, commanded that day, in order from left to right, by Colonels Stiles and Casement and General Reilly, occupied the ground between the Columbia Pike and the river above the town. The front line consisted of 8 regiments, 3 in the works and 1 in reserve for each of the brigades of Stiles and Casement, while Reilly's brigade nearest the pike had but 2 regiments in the works, and 2 in a second line, with still another behind that. West of the pike, reaching to a ravine through which passes a road branching from the Carter's Creek Pike, was Ruger's division of two brigades — the third, under General Cooper, not having come up from Johnsonville. Strickland's brigade, of 4 regiments, had 2 in the works and 2 in reserve. Two of these regiments, the 72d Illinois and 44th Missouri, belonged to A. J. Smith's corps, and had reported to General Schofield only the day before. A third, which was in reserve, the 183d Ohio, was a large and entirely new regiment, having been mustered into service only three weeks before, and joining the army for the first time on the 28th. Moore's brigade, of 6 regiments, had 4 in the works and 2 in reserve. Beyond Ruger, reaching from the ravine to the river below, was Kimball's division of the Fourth Corps, — all veterans, — consisting of three brigades com-

manded by Generals William Grose and Walter C. Whitaker and Colonel Kirby. All the troops in the works were ordered to report to General Cox, to whom was assigned the command of the defenses. General Wood's division of the Fourth Corps had gone over the river with the trains, and two brigades of Wagner's division, which had so valiantly stood their ground at Spring Hill and covered the rear since, were halted on a slope about half a mile to the front. O'Dyke had brought his brigade within the works, and held them massed, near the pike, behind the Carter house. Besides the guns on the knoll, near the railroad cut, there were 6 pieces

dark fringe of chestnuts along the river bank, far across the Columbia Pike, the colors gayly fluttering and the muskets gleaming brightly, and advancing steadily, in perfect order, dressed on the center, straight for the works. Meantime, General Schofield had retired to the fort, on a high bluff on the other side of the river, some two miles away, by the road, and had taken General Stanley with him.

From the fort, the whole field of operations was plainly visible. Notwithstanding all these demonstrations, the two brigades of Wagner were left on the knoll where they had been halted, and, with scarcely an apology for works to protect

in Reilly's works; 4 on Strickland's left; 2 on Moore's left, and 4 on Grose's left—in all, 26 guns in that part of the works, facing south, and 12 more in reserve, on or near the Columbia Pike.

As the bright autumn day, hazy with the golden light of an Indian summer atmosphere, wore away, the troops who had worked so hard looked hopefully forward to a prospect of ending it in peace and rest, preparatory either to a night march to Nashville, or to a reinforcement by Smith's corps and General Thomas. But about two o'clock, some suspicious movements on the hills a mile or two away—the waving of signal flags and the deployment of the enemy in line of battle—caused General Wagner to send his adjutant-general, from the advanced position where his two brigades had halted, to his commanding general, with the information that Hood seemed to be preparing for attack. In a very short time the whole Confederate line could be seen, stretching in battle array, from the

them, had waited until it was too late to retreat without danger of degenerating into a rout.

On came the enemy, as steady and resistless as a tidal wave. A couple of guns, in the advance line, gave them a shot and galloped back to the works. A volley from a thin skirmish line was sent into their ranks, but without causing any delay to the massive array. A moment more, and with that wild "rebel yell" which, once heard, is never forgotten, the great human wave swept along, and seemed to engulf the little force which had so sturdily awaited it.

The first shock came, of course, upon the two misplaced brigades of Wagner's division, which, through some one's blunder, had remained in their false position until too late to retire without disaster. They had no tools to throw up works; and when struck by the resistless sweep of Cleburne's and Brown's divisions, they had only to make their way, as best they could, back to the works. In that wild rush, in which friend and foe were intermingled, and the piercing "rebel yell" rose

high above the "Yankee cheer," nearly seven hundred were made prisoners. But, worst of all for the Union side, the men of Reilly's and Strickland's brigades dared not fire, lest they should shoot down their own comrades, and the guns, loaded with grape and canister, stood silent in the embrasures. With loud shouts of "Let us go into the works with them," the triumphant Confederates, now more like a wild, howling mob than an organized army, swept on to the very works, with hardly a check from any quarter. So fierce was the rush that a number of the fleeing soldiers — officers and men — dropped exhausted into the ditch, and lay there while the terrific contest raged over their heads, till, under cover of darkness, they could crawl safely inside the intrenchments.

On Strickland's left, close to the Columbia Pike, was posted one of the new infantry regiments. The tremendous onset, the wild yells, the whole infernal din of the strife, were too much for such an undisciplined body. As they saw their comrades from the advance line rushing to the rear, they too turned and fled. The contagion spread, and in a few minutes a disorderly stream was pouring down the pike past the Carter house toward the town. The guns were abandoned and the works for a considerable space deserted — only to be occupied a moment later by Cleburne's and Brown's men, who swarmed into the gap. At this critical juncture, Colonel Emerson Opdycke, who, unordered, had brought his command within the works, seeing the fearful peril, ordered forward his well-disciplined brigade, which, deploying

BRIDGE AT FRANKLIN OVER THE HARPETH RIVER —
LOOKING UP-STREAM.

The left of the picture is the north bank of the stream; Franklin is upon the south bank. Fort Granger, where General Schofield had his headquarters, occupied the site of the buildings on the north bank.

as it advanced, was soon involved in as fierce a hand-to-hand fight as ever soldiers engaged in. The regiments which formed Reilly's second line had remained steadfast, and also rallied to the work. A large part of Conrad's and Lane's men, as they came in, though wholly disorganized, turned about and gave the enemy a hot reception. Opdycke's horse was shot under him, and he fought on foot at the head of his brigade. General Cox was everywhere present, encouraging and cheering on his men. General Stanley, who, from the fort where he had gone with General Schofield, had seen the opening clash, galloped to the front as soon as possible and did all that a brave man could until he was painfully wounded. Some of Opdycke's men manned the abandoned guns in Reilly's works; others filled the gap in Strickland's line. These timely movements first checked and then repulsed the assaulting foe, and soon the entire line of works was re-occupied, the enemy sullenly giving up the prize which was so nearly won. Stewart's corps, which was on Cheatham's right, filling the space to the river, kept abreast of its valiant companion, and, meeting no obstacle, reached the works near the Union left before Cheatham made the breach at the Columbia Pike. Owing to the peculiar formation of the field, the left of Stewart's line was thrown upon the same ground with the right of

Cheatham's; the two commands there became much

FRONT VIEW OF THE GIN-HOUSE.

The line of the Union works ran in front of, and only a few feet distant from, the Gin-house; in 1886 a faint depression along the edge of the field still indicated the position. Near the tree seen in the lower picture there is a round, deep hollow which also afforded protection to the Union soldiers. The lower picture was taken from the same point on the pike, looking a little to the right, as the view of "The Carter House, from the Confederate side," on page 605.

VIEW OF THE GIN-HOUSE, FROM THE PIKE.

intermingled. This accounts for so many of General Stewart's officers and men being killed in front of Reilly's and Casement's regiments.

Where there was nothing to hinder the Union fire, the muskets of Siles's and Casement's brigades made fearful havoc; while the batteries at the railroad cut plowed furrows through the ranks of the advancing foe. Time after time they came up to the very works, but they never crossed them except as prisoners. More than one color-bearer was shot down on the parapet. It is impossible to exaggerate the fierce energy with which the Confederate soldiers, that short November afternoon, threw themselves against the works, fighting with what seemed the very madness of despair. There was not a breath of wind, and the dense smoke settled down upon the field, so that, after the first assault, it was impossible to see at any distance. Through this blinding medium, assault after assault was made, several of the Union officers declaring in their reports that their lines received as many as thirteen distinct attacks. Between the gin-house and the Columbia Pike the fighting was fiercest, and the Confederate losses the greatest. Here fell most of the Confederate generals, who, that fateful afternoon, mainly gave up their lives—Adams and Quarles, of Stewart's corps—Adams's horse astride the works, and himself pitched headlong into the Union lines. Cockrell, of the same corps, was severely wounded. In Cheatham's corps, Cleburne and Granberry were killed near the pike. On the west of the pike Strahl and Gist were killed, and Brown was severely wounded. General G. W. Gordon was captured by Opdycke's brigade, inside the works. The heaviest loss in all the Union regiments was in the 44th Missouri, the advance-guard of Smith's long-expected reinforcement, which had been sent to Columbia on the 27th, and was here stationed on the right of the raw regiment, which broke and ran at the first onset of the enemy. Quickly changing front, it held its ground, but with a loss of 34 killed, 37 wounded, and 92 missing, many of the latter being wounded. In the 72d Illinois, its companion, every field-officer was wounded, and the entire color-guard, of 1 sergeant and 8 corporals, was shot down. Its losses were 10 killed, 66 wounded, and 75 missing.

While this infantry battle was going on, Forrest had crossed the river with his cavalry

some distance east of the town, with the evident purpose of getting at Schofield's wagons. But he reckoned without his host. Hatch and Croxton, by General Wilson's direction, fell upon him with such vigor that he returned to the south side, and gave our forces no further

BRIGADIER-GENERAL EMERSON OPDYCKE. (FROM A PHOTOGRAPH.)

trouble. At nightfall the victory was complete on every part of the Union lines. But desultory firing was kept up till long after dark here and there on the Confederate side, though with little result.

At 3 o'clock in the afternoon, as the Confederate lines were forming for their great assault, General Schofield, in reply to a telegram from General Thomas, asking him if he could "hold Hood at Franklin for three days longer," replied, "I do not think I can. . . . It appears to me I ought to take position at Brentwood at once." Accordingly General Thomas, at 3:30, directed him to retire to Brentwood, which he did that night, bringing away all the wagons and other property in safety. Among the spoils of war were 33 Confederate colors, captured by our men from the enemy. The morning found the entire infantry force safe within the friendly shelter of the works at Nashville, where they also welcomed the veterans of A. J. Smith, who had just arrived from Missouri. Soon after, a body of about five thousand men came in from Chattanooga, chiefly sluggards of General Sherman's army, too late for their proper commands. These were organized into a provisional division under General J. B. Steedman,

and were posted between the Murfreesboro' Pike and the river. Cooper's brigade also came in after a narrow escape from capture, as well as several regiments of colored troops from the railroad between Nashville and Johnsonville. Their arrival completed the force on

story is too painful to dwell upon, even after the lapse of 23 years. From the 2d of December until the battle was fought on the 15th, the general-in-chief did not cease, day or night, to send him from the headquarters at City Point, Va., most urgent and often most uncalled-for

orders in regard to his operations, culminating in an order on the 9th relieving him, and directing him to turn over his command and to report himself to General Schofield, who was assigned to his place; an order unprecedented in military annals, but which, if unrevoked, the great captain would have obeyed with loyal single-heartedness. This order, though made out at the Adjutant-General's office in Washington, was not sent to General Thomas, and he did not know of its existence until told of it some years later by General Halleck, at San Francisco. He felt, however, that something of the kind was impending. General Halleck dispatched to him, on the morning of the 9th: "Lieutenant-General Grant expresses much dissatisfaction at your delay in attacking the enemy." His reply shows how entirely he understood the situation: "I feel conscious I have done everything in my power, and that the troops could

MAJOR-GENERAL PATRICK R. CLEBURNE, C. S. A., KILLED AT FRANKLIN, NOVEMBER 30, 1864. (FROM A PHOTOGRAPH.)

which General Thomas was to rely for the task he now placed before himself—the destruction of Hood's army. It was an ill-assorted and heterogeneous mass; not yet welded into an army, and lacking a great proportion of the outfit with which to undertake an aggressive campaign. Horses, wagons, mules, pontoons, everything needed to mobilize an army, had to be obtained. At that time they did not exist at Nashville.

The next day Hood's columns appeared before the town, and took up their positions on a line of hills nearly parallel to those occupied by the Union army, and speedily threw up works, and prepared to defend their ground.

Probably no commander ever underwent two weeks of greater anxiety and distress of mind than General Thomas during the interval between Hood's arrival and his precipitate departure from the vicinity of Nashville. The

not have been gotten ready before this. *If General Grant should order me to be relieved, I will submit without a murmur.*" As he was writing this,—2 o'clock in the afternoon of December 9th,—a terrible storm of freezing rain had been pouring down since daylight, and it kept on pouring and freezing all that day and a part of the next. That night General Grant notified him that the order relieving him—which he had divined—was suspended. But he did not know who had been designated as his successor, nor the humiliating nature of the order. With this threat hanging over him; with the utter impossibility, in that weather, of making any movement; with the prospect that the labors of his whole life were about to end in disappointment, if not disaster,—he never, for an instant, abated his energy or his work of preparation. Not an hour, day or night, was he idle.

Nobody — not even his most trusted staff-officers — knew the contents of the telegrams that came to him. But it was very evident that some-

citizens, begging that wood might be furnished, to keep some poor families from freezing; and, of evenings, Governor Johnson — then Vice-President elect — would unfold to him, with much iteration, his fierce views concerning secession, rebels, and reconstruction. To all he gave a patient and kindly hearing, and he often astonished Governor Johnson by his knowledge of constitutional and international law. But, underneath all, it was plain to see that General Grant's dissatisfaction keenly affected him, and that only by the proof which a successful battle would furnish could he hope to regain the confidence of the general-in-chief.

So when, at 8 o'clock on the evening of December 14th, after having laid his plans before his corps commanders, and dismissed them, he dictated to General Halleck the telegram: "The ice having melted away to-day, the enemy will be attacked to-morrow morning," he drew a deep sigh of relief, and for the first time for a week showed again something of his natural buoyancy and cheerfulness. He moved about more briskly; he put in order all the little last things that remained to be done; he signed his name where it was needed in the letter-book, and then, giving orders to his staff-officers to be ready at 5 o'clock the next morning, went gladly to bed.

The ice had not melted a day too soon; for, while he was writing the telegram to General Halleck, General Logan was speeding his way to Nashville, with orders from General Grant which would have placed him in command of all the Union forces there assembled. General Thomas, fortunately, did not then learn this second proof of General Grant's lack of confidence; and General Logan, on reaching Louisville, found that

GENERAL GRANT, FROM A PHOTOGRAPH.

thing greatly troubled him. While the rain was falling and the fields and roads were ice-bound, he would sometimes sit by the window for an hour or more, not speaking a word, gazing steadily out upon the forbidding prospect, as if he were trying to will the storm away. It was curious and interesting to see how, in this gloomy interval, his time was occupied by matters not strictly military. Now, it was a visit from a delegation of the city government, in regard to some municipal regulation; again, somebody whose one horse had been seized and put into the cavalry; then, a committee of

COLONEL JOHN OVERTON'S HOUSE, GENERAL HOOD'S HEADQUARTERS BEFORE NASHVILLE.

The lower picture shows a casemate protected with railroad iron. The hills in the distance were the Confederate center and left at the opening of the fight.

the work intended for him was already done—and he came no farther. At the very time that these orders were made out, at Washington, in obedience to General Grant's directions, a large part of the cavalry was unmounted; two divisions were absent securing horses and proper outfit; wagons were unfinished and mules lacking or unbroken; pontoons unmade and pontoniers untrained; the ground was covered with a glare of ice which made all the fields and hillsides impassable for horses and scarcely passable for foot-men. The natives declared that the Yankees brought their weather as well as their army with them. Every corps commander in the army protested that a movement under such conditions would be little short of madness, and certain to result in disaster.

A very considerable reorganization of the army also took place during this enforced delay. General Stanley, still suffering from his wound, went North, and General T. J. Wood, who had been with it from the beginning, suc-

ceeded to the command of the Fourth Corps. General Ruger, who had commanded a division in the Twenty-third Corps, was also disabled by sickness, and was succeeded by General D. N. Couch, formerly a corps commander in the Army of the Potomac, and who had recently been assigned to duty in the Department of the Cumberland. General Wagner was retired from command of his division, and was succeeded by General W. L. Elliott, who had been chief of cavalry on General Thomas's staff in the Atlanta campaign. General Kenner Garrard, who had commanded a cavalry division during the Atlanta campaign, was assigned to an infantry division in Smith's corps. In all these cases, except in that of General Wood succeeding to the command of the Fourth Corps, the newly assigned officers were entire strangers to the troops over whom they were placed.

On the afternoon of the 14th of December General Thomas summoned his corps commanders, and, delivering to each a written

Near the base of the first column is seen in the distance the flag of Fort Negley.

wheel, and to threaten and perhaps attack Montgomery Hill; while General Schofield was to be held in reserve, near the left center, for such use as the exigency might develop.

It was not daylight, on the morning of the 15th of December, when the army began to move. In most of the camps, reveille had been sounded at 4 o'clock, and by 6 everything was ready. It turned out a warm, sunny, winter morning. A dense fog at first hung over the valleys and completely hid all movements; but by 9 o'clock this had cleared away. General Steedman, on the extreme left, was the first to draw out of the defenses, and to assail the enemy, at their works between the Nolensville and Murfreesboro' pikes. It was not intended as a real attack, though it had that effect. Two of Steedman's brigades, chiefly colored troops, kept two divisions of Cheatham's corps constantly busy, while his third was held in reserve; thus one Confederate corps was disposed of. Lee's corps, next on Cheatham's left, after sending two brigades to the assistance of Stewart, on the right, was held in place by the threatening position of the garrison troops, and did not fire a shot during the day. Indeed, both Cheatham's and Lee's corps were held, as in a vise, between Steedman and the Fourth Corps. Lee's Corps was unable to move or to fight. Steedman maintained the ground he occupied till the next morning, with no very heavy loss.

When, about 9 o'clock the sun began to burn away the fog, the sight from General Thomas's position was inspiring. A little to the left, on Montgomery Hill, the salient of the Confederate lines, and not more than six hundred yards distant from Wood's salient, on Lawrens Hill, could be seen the advance line of works, behind which an unknown force of the enemy lay in wait. Beyond, and along the Hillsboro' Pike were stretches of stone wall, with here and there a detached earthwork, through whose embrasures peeped the threatening artillery. To the right, along the valley of Richland Creek, the dark line of Wilson's advancing cavalry could be seen slowly making its difficult way across the wet, swampy, stumpy ground. Close in front, and at the foot of the hill, its right joining Wilson's left, was A. J. Smith's corps, full of cheer and enterprise, and glad to be once more in the open field. Then came the Fourth Corps, whose left, bending back toward the north, was hidden behind Lawrens Hill. Already the skirmishers were engaged, the Confederates slowly falling back before the determined and steady pressure of Smith and Wood.

By the time that Wilson's and Smith's lines were fully extended and brought up to within striking distance of the Confederate works, along the Hillsboro' Pike, it was noon. Post's

brigade of Wood's old division (now commanded by General Sam Beatty), which lay at the foot of Montgomery Hill, full of dash and enterprise, had since morning been regarding the works at the summit with covetous eyes. At Post's suggestion, it was determined to see which party wanted them most. Accordingly, a charge was ordered — and in a moment the brigade was swarming up the hillside, straight for the enemy's advanced work. For almost the first time since the grand assault on Missionary Ridge, a year before, here was an open field where everything could be seen. From General Thomas's headquarters everybody looked on with breathless suspense, as the blue line, broken and irregular, but with steady persistence, made its way up the steep hillside against a fierce storm of musketry and artillery. Most of the shots, however, passed over the men's heads. It was a struggle to keep up with the colors, and, as they neared the top, only the strongest were at the front. Without a moment's pause, the color-bearers and those who had kept up with them, Post himself at the head, leaped the parapet. As the colors waved from the summit, the whole line swept forward and was over the works in a twinkling, gathering in prisoners and guns. Indeed, so large was the mass of prisoners that a few minutes later were seen heading toward our own lines, that it was feared by a number of officers at General Thomas's headquarters that the assault had failed and that the prisoners were Confederate reserves who had rallied and retaken the works. But the fear was only momentary; for the wild outburst of cheers which rang across the valley told the story of complete success.

Meanwhile, farther to the right, as the opposing lines neared each other, the sound of battle grew louder and louder, and the smoke thicker and thicker, until the whole valley was filled with the haze. It was now past noon, and, at every point, the two armies were so near together that an assault was inevitable. Hatch's division of Wilson's cavalry, at the extreme right of the continuous line, was confronted by one of the detached works which Hood had intended to be "impregnable"; and the right of McArthur's division of A. J. Smith's infantry was also within striking distance of it. Coon's cavalry brigade was dismounted and ordered to assault the work, while Hill's infantry brigade received similar orders. The two commanders moved forward at the same time, and entered the work together, Colonel Hill falling dead at the head of his command. In a moment the whole Confederate force in that quarter was routed, and fled to the rear, while the captured guns were turned on them.

With the view of extending the operations of Wilson's cavalry still farther to the right, and if possible gaining the rear of the enemy's left, the two divisions of the Twenty-third Corps, which had been in reserve near Lawrens Hill, were ordered to Smith's right, while orders were sent to Wilson to gain, if possible, a lodgment on the Granny White Pike. These orders were promptly obeyed, and Cooper's brigade on reaching its new position got into a handsome fight, in which its losses were more than the losses of the rest of the Twenty-third corps during the two days' battle.

But though the enemy's left was thus rudely driven from its fancied security, the salient at the center, being an angle formed by the line along Hillsboro' Pike and that stretching toward the east, was still firmly held. Post's successful assault had merely driven out or captured the advance forces. The main line remained intact. As soon as word came of the successful assault on the right, General Thomas sent orders to General Wood, commanding the Fourth Corps, to prepare to attack the salient. The staff-officer by whom this order was sent did not at first find General Wood; but seeing the two division commanders whose troops would be called upon for the work, gave them the instructions. As he was riding along the line, he met one of the brigade commanders — an officer with a reputation for exceptional courage and gallantry — who, in reply to the direction to prepare for the expected assault, said, "You don't mean that we've got to go in here and attack the works on that hill?" "Those are the orders," was the answer. Looking earnestly across the open valley, and at the steep hill beyond, from which the enemy's guns were throwing shot and shell with uncomfortable frequency and nearness, he said, "Why, it would be suicide, sir; perfect suicide." "Nevertheless, those are the orders," said the officer; and he rode on to complete his work. Before he could rejoin General Thomas, the assault was made, and the enemy driven out with a loss of guns, colors, and prisoners, and the whole line was forced to abandon the works along the Hillsboro' Pike, and fall back to the Granny White Pike. The retreating line was followed by the entire Fourth Corps, as well as by the cavalry and Smith's troops; but night soon fell, and the whole army went into bivouac in the open fields wherever they chanced to be.

At dark, Hood, who at 12 o'clock had held an unbroken, fortified line from the Murfreesboro' to the Hillsboro' Pike, with an advanced post on Montgomery Hill, and five strong redoubts along the Hillsboro' Pike, barely maintained his hold of a line from the Murfreesboro'

Pike to the Granny White Pike, near which, on two large hills the left of his army had taken refuge, when driven out of their redoubts by Smith and Wilson. These hills were more than two miles to the rear of his morning position.

THE CAPITOL, NASHVILLE.

Strong works, set with cannon, inclosed the foundations of the Capitol. Cisterns within the building held a bountiful supply of water. Owing to its capacity and the massiveness of the lower stories, the Capitol was regarded as a citadel, in which a few thousand men could maintain themselves against an army.

It was to that point that Bate, who had started from Hood's right when the assault was first delivered on the redoubts, now made his way amidst, as he says, "streams of stragglers, and artillerists, and horses, without guns or caissons — the sure indications of defeat."

General Hood, not daunted by the reverses which had befallen him, at once set to work to prepare for the next day's struggle. As soon as it was dusk, Cheatham's whole corps was moved from his right to his left; Stewart's was retired some two miles and became the center; Lee's also was withdrawn, and became the right. The new line extended along the base of a range of hills, two miles south of that occupied during the day, and was only about half as long as that from which he had been driven. During the night, they threw up works along their entire front, and the hills on their flanks were strongly fortified. The flanks were also further secured by return works, which prevented them from being left "in the air." Altogether, the position was naturally far more formidable than that just abandoned.

At early dawn the divisions of the Fourth Corps moved forward, driving out the opposing skirmishers. The men entered upon the work with such ardor that the advance soon quickened into a run, and the run almost into a charge. They took up their positions in

front of the enemy's new line, at one point coming within 250 yards of the salient at Overton Hill. Here they were halted, and threw up works, while the artillery on both sides kept up a steady and accurate fire. Steedman also moved forward and about noon joined his right to Wood's left, thus completing the alignment.

On his way to the front General Thomas heard the cannonading, and, as was his custom, rode straight for the spot where the action seemed heaviest. As he was passing a large, old-fashioned house, his attention was attracted by the noise of a window closing with a slam as emphatic as that which the poet Hood has celebrated in rhyme. Turning to see the cause of this wooden exclamation, he was greeted by a look from a young lady, whose expression at the moment was the reverse of angelic. With an amused smile, the general rode on, and soon forgot the incident in the excitement of battle. But this trifling event had a sequel. The young lady, in process of time,

became the affectionate and faithful wife of an officer then serving in General Thomas's army,—though he did not happen to be a witness of this episode.

The ground between the two armies for the greater part of the way from the Franklin to the Granny White Pike is low, open, crossed by frequent streams running in every direction, and most of the fields were either newly plowed or old cornfields, and so, heavy, wet, and muddy from the recent storms. Overton's Hill, Hood's right, is a well-rounded slope, the top of which was amply fortified, while hills held by the left of his line just west of the Granny White Pike are so steep that it is difficult to climb them, and their summits were crowned with formidable barricades, in front of which were *abattis* and masses of fallen trees. Between these extremities the works in many places consisted of stone walls covered with earth, with head logs on the top. To their rear were ample woods, sufficiently open to enable troops to move through them, but thick enough to afford good shelter. Artillery was also posted at every available spot, and good use was made of it.

The morning was consumed in the movements referred to. Wilson's cavalry, by a wide *détour*, had passed beyond the extreme Confederate left, and secured a lodgment on

the Granny White Pike. But one avenue of escape was now open for Hood — the Franklin Pike. General Thomas hoped that a vigorous assault by Schofield's corps against Hood's left would break the line there, and thus enable the cavalry, relieved from the necessity of operating against the rebel flank, to gallop down the Granny White Pike to its junction with the Franklin, some six or eight miles below, and plant itself square across the only remaining line of retreat. If this scheme could be carried out, nothing but capture or surrender awaited Hood's whole army.

Meantime, on the national left, Colonel Post, who had so gallantly carried Montgomery Hill the morning before, had made a careful reconnaissance of Overton Hill, the strong position on Hood's right. As the result of his observation, he reported to General Wood, his corps commander, that an assault would cost dear, but he believed could be made successfully; at any rate he was ready to try it. The order was accordingly given, and everything prepared. The brigade was to be supported on either side by fresh troops to be held in readiness to rush for the works the moment Post should gain the parapet. The bugles had not finished sounding the charge, when Post's brigade, preceded by a strong line of skirmishers, moved forward, in perfect silence, with orders to halt for nothing, but to gain the works at a run. The men dashed on, Post leading, with all speed through a shower of shot and shell. A few of the skirmishers reached the parapet; the main

mortal. This slight hesitation and the disabling of Post were fatal to the success of the assault. The leader and animating spirit gone, the line slowly drifted back to its original position, losing in those few minutes nearly 300 men; while the supporting brigade on its left lost 250.

Steedman had promised to coöperate in this assault, and accordingly Thompson's brigade of colored troops was ordered to make a demonstration at the moment Post's advance began. These troops had never before been in action and were now to test their mettle. There had been no time for a reconnaissance, when this order was given, else it is likely a way would have been found to turn the enemy's extreme right flank. The colored brigade moved forward against the works east of the Franklin Pike and nearly parallel to it. As they advanced, they became excited, and what was intended merely as a demonstration was unintentionally converted into an actual assault. Thompson, finding his men rushing forward at the double-quick, gallantly led them to the very slope of the intrenchments. But, in their advance across the open field, the continuity of his line was broken by a large fallen tree. As the men separated to pass it, the enemy opened an enfilading fire on the exposed flanks of the gap thus created, with telling effect. In consequence, at the very moment when a firm and compact order was most needed, the line came up ragged and broken. Meantime Post's assault was repulsed, and the fire which had been concentrated on him was turned against Thompson. Nothing was left, therefore, but to withdraw as soon as possible to the original position. This was done without panic or confusion, after a loss of 467 men from the three regiments composing the brigade.

When it was seen that a heavy assault on his right, at Overton Hill, was threatening, Hood ordered Cleburne's old division to be sent over to the exposed point, from the extreme left, in front of Schofield. About the same time, General Couch, commanding one of the divisions of the Twenty-third Corps, told General Schofield that he believed he could carry the hill in his front, but doubted if he could hold it without assistance. The ground in front of General Cox, on Couch's right, also

offered grand opportunities for a successful assault. Meantime, the cavalry, on Cox's right, had made its way beyond the extreme left flank of the enemy, and was moving northward over the wooded hills direct to the rear of the extreme rebel left.

VIEW OF A PART OF THE UNION LINES AT NASHVILLE.
(FROM A PHOTOGRAPH.)

line came within twenty steps of the works, when, by a concentrated fire of musketry and artillery from every available point of the enemy's line, the advance was momentarily checked, and, in another instant, Post was brought down by a wound, at first reported as

General Thomas, who had been making a reconnaissance, had no sooner reached Schofield's front than General McArthur, who commanded one of Smith's divisions, impatient at the long waiting, and not wanting to spend the second night on the rocky hill he was occupying, told Smith that he could carry the high hill in front of Couch, the same which Couch himself had told Schofield he could carry, and would undertake it unless forbidden. Smith silently acquiesced, and McArthur set to work. Withdrawing McMillen's (his right) brigade from the trenches, he marched it by the flank in front of General Couch's position, and with orders to the men to fix bayonets, not to fire a shot and neither to halt nor to cheer, until they had gained the enemy's works, the charge was sounded. The gallant brigade, which had served and fought in every portion of the South-west, moved swiftly down the slope, across the narrow valley, and began scrambling up the steep hillside, on the top of which was the redoubt, held by Bate's division, and manned also with Whitworth guns. The bravest onlookers held their breath, as these gallant men steadily and silently approached the summit, amid the crash of musketry and the boom of the artillery. In almost the time it has taken to tell the story, they gained the works, their flags were wildly waving from the parapet and the unmistakable cheer, "the voice of the American people," as General Thomas called it, rent the air. It was an exultant moment; but this was only a part of the heroic work of that afternoon. While McMillen's brigade was preparing for this wonderful charge, Hatch's division of cavalry, dismounted, had also pushed its way through the woods, and had gained the top of two hills which commanded the rear of the enemy's works. Here, with incredible labor, they had dragged, by hand, two pieces of artillery, and, just as McMillen began his charge, opened on the hill where Bate was, up the opposite slope of which the infantry were scrambling. At the same time, Coon's brigade of Hatch's division with resounding cheers, charged upon the enemy and poured such volleys of musketry from their repeating rifles as I have never heard equaled. Thus beset on both sides, Bate's people broke out of the works, and ran down the hill toward their right and rear, as fast as their legs could carry them. It was more like a scene in a spectacular drama than a real incident in war. The hillside in front still green, dotted with the boys in blue swarming up the slope; the dark background of high hills beyond; the lowering clouds; the waving flags; the smoke slowly rising through the leafless tree-tops and drifting across the valleys; the won-

derful outburst of musketry; the ecstatic cheers; the multitude racing for life down into the valley below,—so exciting was it all, that the lookers-on instinctively clapped their hands, as at a brilliant and successful transformation scene, as indeed it was. For, in those few minutes, an army was changed into a mob, and the whole structure of the rebellion in the South-west, with all its possibilities, was utterly overthrown. As soon as the other divisions farther to the left saw and heard the doings on their right, they did not wait for orders. Everywhere, by a common impulse, they charged the works in their front, and carried them in a twinkling. General Edward Johnson and nearly all his division and his artillery were captured. Over the very ground where, but a little while before, Post's assault had been repulsed, the same troops now charged with resistless force, capturing 14 guns and 1000 prisoners. Steedman's colored brigades also rallied, and brought in their share of prisoners and other spoils of war. Everywhere the success was complete.

Foremost among the rejoicing victors was General Steedman, under whose command were the colored troops. Steedman had been a life-long Democrat and was one of the delegates, in 1860, to the Charleston convention, at which ultimately Breckinridge was nominated for President. As he rode over the field, immediately after the rout of the enemy, he asked, with a grim smile, as he pointed to the fleeing hosts, "I wonder what my Democratic friends over there would think of me if they knew I was fighting them with 'nigger' troops?"

It is needless to tell the story of the pursuit, which only ended, ten days later, at the Tennessee River. About a month before, General Hood had triumphantly begun his northward movement. Now, in his disastrous retreat, he was leaving behind him, as prisoners or deserters, a larger number of men than General Thomas had been able to place at Pulaski to hinder his advance—to say nothing of his terrific losses in killed at Franklin. The loss to the Union army, in all its fighting,—from the Tennessee River to Nashville and back again,—was less than six thousand killed, wounded, and missing. At so small a cost, counting the chances of war, the whole North-west was saved from an invasion that, if Hood had succeeded, would have more than neutralized all Sherman's successes in Georgia and the Carolinas: saved by the steadfast labors, the untiring energy, the rapid combinations, the skillful evolutions, the heroic courage and the tremendous force of one man, whose name will yet rank among the great captains of all time.

Henry Stone.

MEMORANDA ON THE CIVIL WAR.

General Donaldson's Fortunate Mistake.

PREPAR to the battle of Nashville, Major-General James L. Donaldson (who won honors in the Mexican war, and was died in the spring of 1886) was quartermaster under General Thomas. He once told me the following incident.

Having occasion to purchase mules for the army, he ordered a person in whom he had confidence to visit the contiguous Northern States, inadvertently saying to him, "Buy as many as you can"—not supposing he would be able to secure more than a few thousand at the most. Some weeks afterward, just before the attack upon Hood's army, General Donaldson, on meeting his agent, inquired how many mules he had been able to secure. To the amazement of the general, he was informed that *twenty thousand* or more had been obtained. Upon which the astonished general exclaimed, "I am a ruined man! I shall be court-martialed and driven from the army for not limiting you in the purchase. You have procured many times more than I had any idea or intention of purchasing; but the fault is mine, not yours. I ought to have been particular in my orders." In an extremely disheartened state he went to his home, believing that such a thoughtless act on his part could not be overlooked by the commanding general.

He had scarcely reached his house before a messenger came from General Thomas with an order for General Donaldson to come immediately to headquarters. This seemed to be the sealing of his fate, and in a state of trepidation bordering on frenzy he appeared before General Thomas, whom he found in a mood, apparently, of great depression. Soon after Donaldson had entered his presence General Thomas said, "Donaldson, how many mules have you?" With some perturbation he replied, "Upwards of twenty-five thousand." "*Twenty-five thousand*, did you say?" repeated the general. "Is it possible that you have this number? Donaldson, accept my most heartfelt thanks; *you have saved this army!* I can now have transportation, and can fight Hood, and will do so at once."

R. H. Eddy.

General Grant on the Terms at Vicksburg.

THE following letter, dated New York, November 30, 1884, not hitherto printed, was addressed to General Marcus J. Wright, Agent of the War Department for the collection of Confederate Records, by whose permission it is here printed from the original manuscript:

DEAR GENERAL: Herewith I send you General Pemberton's account of the surrender of Vicksburg. As the written matter is "Copy," and supposing you have what it has been copied from, I do not return it, though I will if you inform me that you want it.

A gentleman from Philadelphia sent me the same matter I return herewith, last summer. I probably left the paper at Long Branch, but do not know certainly. All there is of importance in the matter of the

surrender of Vicksburg is contained in the correspondence between General Pemberton and myself. The fact is, General Pemberton, being a Northern man commanding a Southern army, was not at the same liberty to surrender an army that a man of Southern birth would be. In adversity or defeat he became an object of suspicion, and felt it. Bowen was a Southern man all over, and knew the garrison of Vicksburg had to surrender or be captured, and knew it was best to stop further effusion of blood by surrendering. He did all he could to bring about that result.

Pemberton is mistaken in several points. It was Bowen that proposed that he and A. J. Smith should talk over the matter of the surrender and submit their views. Neither Pemberton nor I objected; but we were not willing to commit ourselves to accepting such terms as they might propose. In a short time those officers returned. Bowen acted as spokesman. What he said was substantially this: the Confederate Army was to be permitted to march out with the honors of war, carrying with them their arms, colors, and field batteries. The National troops were then to march in and occupy the city, and retain the siege guns, small arms not in the hands of the men, all public property remaining. Of course I rejected the terms at once. I did agree, however, before we separated, to write Pemberton what terms I would give. The correspondence is public and speaks for itself. I held no council of war. Hostilities having ceased, officers and men soon became acquainted with the reason why. Curiosity led officers of rank—most all the general officers—to visit my headquarters with the hope of getting some news. I talked with them very freely about the meeting between General Pemberton and myself, our correspondence, etc. But in no sense was it a council of war. I was very glad to give the garrison of Vicksburg the terms I did. There was a cartel in existence at that time which required either party to exchange or parole all prisoners either at Vicksburg or at a point on the James river within ten days after captures or as soon thereafter as practicable. This would have used all the transportation we had for a month. *The men had behaved so well that I did not want to humiliate them. I believed that consideration for their feelings would make them less dangerous foes during the continuance of hostilities, and better citizens after the war was over.*

I am very much obliged to you, General, for your courtesy in sending me these papers. Very truly yours,

U. S. Grant.

The Cause of a Silent Battle.

IN the interesting articles upon the Civil War which have appeared in THE CENTURY, reference has been made (page 764, March, and page 150, May, 1885) to the supposed effect of the wind in preventing, as in the case of the heavy cannonading between the *Merrimac* and *Congress*, the transference of sound-waves a distance of not over three and one-half miles over water; and

at another time, during the bombardments of the Confederate works at Port Royal, a distance of not more than two miles. "The day was pleasant," says the observer, "and the wind did not appear unusually strong." Yet "people living in St. Augustine, Florida, told me afterward that the Port Royal cannonade was heard at that place, 150 miles from the fight."

It occurs to me that the effect of the wind is greatly exaggerated in these instances. How an ordinary breeze could "carry all sounds of the conflict away from people standing within plain sight of it" and yet carry the same sound 150 miles in the opposite direction, is rather too strongly opposed to scientific fact to remain on record undisputed.

In all of these cases, is it not probable that the varying density of the air had much more to do with this strange acoustic opacity than the wind?

These statements call to mind the prevalent belief that fog, snow, hail, and rain, indeed any conditions of the atmosphere that render it optically opaque, render it also acoustically opaque; which up to the time of Mr. Tyndall's experiments in the English Channel, off Dover, had scarcely been questioned. His tests made in 1873-74 proved conclusively, as is now well known, that on clear days the air may be composed of differently heated masses, saturated in different degrees with aqueous vapors, which produce exactly the deadening effects described above.

I submit as a case in point a similar effect, and its explanation as furnished by Mr. R. G. H. Kean to Professor Tyndall; and considered by the latter of sufficient value to find a place in his published works:

"On the afternoon of June 28, 1862, I rode, in company with General G. W. Randolph, then Secretary of War of the Confederate States, to Price's house, about nine miles from Richmond, the evening before General Lee had begun his attack on McClellan's army, by crossing the Chickahominy about four miles above Price's, and driving in McClellan's right wing.

"The battle of Gaines's Mill was fought the afternoon to which I refer. The valley of the Chickahominy is about one and a half miles wide from hill-top to hill-top. Price's is on one hill-top, that nearest to Richmond; Gaines's farm, just opposite, is on the other, reaching back in a plateau to Cold Harbor.

"Looking across the valley I saw a good deal of the battle, Lee's right resting in the valley, the Federal left wing the same. My line of vision was nearly in the line of the lines of battle. I saw the advance of the Confederates, their repulse two or three times, and in the gray of the evening the final retreat of the Federal forces. I distinctly saw the musket-fire of both lines, the smoke, individual discharges, the flash of the guns. I saw batteries of artillery on both sides come into action and fire rapidly. Several field-batteries on each side were plainly in sight. Many more were hid by the timber which bounded the range of vision.

"Yet looking for nearly two hours, from about five to seven P. M. on a midsummer afternoon, at a battle in which at least fifty thousand men were actually engaged, and doubtless at least one hundred pieces of field-artillery, through an atmosphere optically as limpid as possible, *not a single sound of the battle* was audible to General Randolph and myself. I remarked it to him at the time as astonishing.

"Between me and the battle was the deep, broad valley of the Chickahominy, partly a swamp shaded from the declining sun by the hills and forest in the west (my side). Part of the valley on each side of the swamp was cleared: some in cultivation, some not. Here were conditions capable of providing several belts of air, varying in the amount of watery vapor (and probably in temperature), arranged like laminæ at right angles to the acoustic waves as they came from the battle-field to me."

John B. De Motte.

DE PAUW UNIVERSITY, INDIANA.

A Reply to Colonel Mosby by General Robertson.

In the May number of THE CENTURY Colonel John S. Mosby has seen proper to make mention of my command in the cavalry of the Army of Northern Vir-

ginia during the Gettysburg campaign; and as a means of defending General J. E. B. Stuart from an imaginary attack has misrepresented a portion of General Stuart's cavalry. Colonel Mosby knows very little of Stuart's character if he supposes that so true a soldier would have silently passed over such disobedience of orders as Colonel Mosby imputes to me. The fact that Colonel Mosby has "lately discovered documents in the archives" at Washington, which are to "set at rest" something that has not been set in motion, will not excuse him for attempting in 1887 to prove by argument that Stuart in 1863 did not know whether I had obeyed his orders in the Gettysburg campaign.

The orders left with me by General Stuart, dated June 24th, were exactly obeyed by me, to his entire satisfaction as well as to that of General R. E. Lee. These orders embraced the duty of holding Ashby's and Snicker's gaps, to prevent Hooker from interrupting the march of Lee's army; and "in case of a move by the enemy on Warrenton," to counteract it if possible. I was also ordered when I withdrew from the gaps to "withdraw to the west side of the Shenandoah," to cross the Potomac where Lee crossed, and to "follow the army, keeping on its right and rear."

The only road by which the orders (which particularly specified the avoidance of "turnpikes" on account of the difficulty and delay of shoeing horses) could be complied with, carried my command to Martinsburg; at which place, *and not in the gaps of the mountains*, as Colonel Mosby insinuates, a courier from General Lee met me. My command was hurried from there to Chambersburg and thence by forced march, on the night of July 2d, to Cashtown, where it arrived at about 10 A. M. on July 3d. Ascertaining at Cashtown that General Pleasanton was moving from Emmetsburg directly on the baggage and ammunition trains of General Lee's army, which were exposed to his attack without defense of any kind, I pressed forward with my command and intercepted the advance of General Pleasanton, under the command of Major Samuel H. Starr. A severe and gallant fight was made at Fairfield, in which Major Starr of the 6th United States Regular Cavalry was wounded and captured with a large portion of his staff, while his regiment was severely damaged. Adjutant John Allan and three others of the 6th Virginia Cavalry were killed, 19 were wounded, and 5 were reported missing.

That fight at Fairfield, on the last day of the fighting at Gettysburg, refutes the imputation intended by Colonel Mosby to be conveyed in his remark that my command "did not reach the battle-field."

From that fight at Fairfield I was ordered by General R. E. Lee to cover his wagon trains, and in obeying the same, my command was engaged in repeated skirmishes, particularly at Funkstown and Hagerstown, after which it returned to Virginia,—the last command that recrossed the Potomac.

If there existed the least ground for Colonel Mosby's statements, there would be found among the reports of general officers some reference to the imputed dereliction of duty on my part. As no such reference is made, and no imputation of disobedience of orders intimated, it may be assumed that neither Stuart nor Lee had any reason to complain of my command.

B. H. Robertson.

THE SONGS OF THE WAR.

NATIONAL hymn is one of the things which cannot be made to order. No man has ever yet sat him down and taken up his pen and said, "I will write a national hymn," and composed either words or music which the nation was willing to take for its own. The making of the song of a people is a happy accident, not to be accomplished by raking thought. It must be the result of fiery feeling long confined, and suddenly finding vent in burning words or moving strains. Sometimes the heat and the pressure of emotion have been fierce enough and intense enough to call forth at once both words and music, and to weld them together indissolubly once and for all. Almost always the maker of the song does not suspect the abiding value of his work; he has wrought unconsciously, moved by a power within; he has written for immediate relief to himself, and with no thought of fame or the future; he has builded better than he knew. The great national lyric is the result of the conjunction of the hour and the man. Monarchs cannot command it, and even poets are often powerless to achieve it. No one of the great national hymns has been written by a great poet. But for his one immortal lyric, neither the author of the "Marseillaise" nor the author of the "Wacht am Rhein" would have his line in the biographical dictionaries. But when a song has once taken root in the hearts of a people, time itself is powerless against it. The flat and feeble "Partant pour la Syrie," which a filial fiat made the hymn of imperial France, had to give way to the strong and virile notes of the "Marseillaise," when there was need to arouse the martial spirit of the French in 1870. The noble measures of "God Save the King," as simple and dignified a national hymn as any country can boast, lift up the hearts of the English people; and the brisk tune of the "British Grenadiers" has swept away many a man into the ranks of the recruiting regiment. The English are rich in war tunes; and the pathetic "Girl I left behind me" encourages and sustains both those who go to the front and those who remain at home. Here in the United States we have no "Marseillaise," no "God Save the King," no "Wacht am Rhein"; we have but "Yankee Doodle" and the "Star-spangled Banner." More than one enterprising poet,

and more than one aspiring musician, has volunteered to take the contract to supply the deficiency; as yet no one has succeeded. "Yankee Doodle" we got during the Revolution, and the "Star-spangled Banner" was the gift of the war of 1812; from the Civil War we have received at least two war songs which, as war songs simply, are finer than either of these,— "John Brown's Body" and "Marching through Georgia."

Of the purely lyrical outburst which the war called forth, but little trace is now to be detected in literature except by special students.* In most cases neither words nor music have had vitality enough to survive a quarter of a century. Really, indeed, two things only survive, one Southern and the other Northern, one a war-cry in verse, the other a martial tune: one is the lyric "My Maryland," and the other is the marching song "John Brown's Body." The origin and development of the latter, the rude chant to which a million of the soldiers of the Union kept time, is uncertain and involved in dispute. The history of the former may be declared exactly; and by the courtesy of those who did the deed—for the making of a war song is of a truth a deed at arms—I am enabled to state fully the circumstances under which it was written, set to music, and first sung before the soldiers of the South.

MY MARYLAND.

The despot's heel is on thy shore,
Maryland!
His torch is at thy temple door,
Maryland!
Avenge the patriotic gore
That flecked the streets of Baltimore,
And be the battle-queen of yore,
Maryland! My Maryland!

Hark to an exiled son's appeal,
Maryland!
My Mother-State, to thee I kneel!
Maryland!
For life and death, for woe and weal,
Thy peerless chivalry reveal,
And gird thy beauteous limbs with steel,
Maryland! My Maryland!

Thou wilt not cower in the dust,
Maryland!
Thy beaming sword shall never rust,
Maryland!
Remember Carroll's sacred trust,
Remember Howard's warlike thrust
And all thy slumberers with the just,
Maryland! My Maryland!

* Note that reference is here made to the songs, not to the general poetry of the war.

Hark to an exiled son's appeal,
 Maryland!
 My Mother-State, to thee I kneel,
 Maryland!
 For life and death, for woe and weal,
 Thy peerless chivalry reveal,
 And gird thy beauteous limbs with steel,
 Maryland! My Maryland!

James R. Randall

Come! 'Tis the red dawn of the day,
 Maryland!
 Come with thy panoplied array,
 Maryland!
 With Ringgold's spirit for the fray,
 With Watson's blood at Monterey,
 With fearless Lowe and dashing May,
 Maryland! My Maryland!

Dear Mother, burst the tyrant's chain,
 Maryland!
 Virginia should not call in vain,
 Maryland!
 She meets her sisters on the plain,
Sic Semper! 'Tis the proud refrain
 That baffles minions back again,
 Maryland!
 Arise, in majesty again,
 Maryland! My Maryland!

Come, for thy shield is bright and strong,
 Maryland!
 Come, for thy dalliance does thee wrong,
 Maryland!
 Come to thine own heroic throng,
 Stalking with liberty along,
 And chaunt thy dauntless slogan-song,
 Maryland! My Maryland!

I see the blush upon thy cheek,
 Maryland!
 For thou wast ever bravely meek,
 Maryland!
 But lo! there surges forth a shriek;
 From hill to hill, from creek to creek,
 Potomac calls to Chesapeake,
 Maryland! My Maryland!

Thou wilt not yield the Vandal toll,
 Maryland!
 Thou wilt not crook to his control,
 Maryland!
 Better the fire upon thee roll,
 Better the shot, the blade, the bowl,
 Than crucifixion of the soul,
 Maryland! My Maryland!

I hear the distant thunder-hum,
 Maryland!
 The Old Line bugle, fife and drum,
 Maryland!
 She is not dead, nor deaf, nor dumb!
 Huzza! She spurns the Northern scum!
 She breathes! She burns! She'll come!
 She'll come!
 Maryland! My Maryland!

(Perhaps there is no need now for even a line of good-natured depreciation of some of the terms used in this song, overwrought and inaccurate as they are. As but few, North or South, have ever seen the entire poem, it is printed here in full from the author's manuscript. Its lines show plainly enough that they owe their being to a white-heat of emotion. It is valuable, therefore, historically, as a record of the feelings of the hour in the South, although not of the facts of the hour either in Baltimore or at the North.)

"My Maryland!" was written by Mr. James R. Randall, a native of Baltimore, and now residing in Augusta, Georgia. The poet was a professor of English literature and the

classics in Poydras College at Pointe Coupée, on the Fausse Rivière, in Louisiana, about seven miles from the Mississippi; and there in April, 1861, he read in the New Orleans "Delta" the news of the attack on the Massachusetts troops as they passed through Baltimore.

"This account excited me greatly," Mr. Randall writes in answer to my request for information: "I had long been absent from my native city, and the startling event there inflamed my mind. That night I could not sleep, for my nerves were all unstrung, and I could not dismiss what I had read in the paper from my mind. About midnight I rose, lit a candle, and went to my desk. Some powerful spirit appeared to possess me, and almost involuntarily I proceeded to write the song of 'My Maryland.' I remember that the idea appeared to first take shape as music in the brain — some wild air that I cannot now recall. The whole poem was dashed off rapidly when once begun. It was not composed in cold blood, but under what may be called a conflagration of the senses, if not an inspiration of the intellect. I was stirred to a desire for some way linking my name with that of my native State, if not 'with my land's language.' But I never expected to do this with one single, supreme effort, and no one was more surprised than I was at the widespread and instantaneous popularity of the lyric I had been so strangely stimulated to write." Mr. Randall read the poem the next morning to the college boys, and at their suggestion sent it to the "Delta," in which it was first printed, and from which it was copied into nearly every Southern journal. "I did not concern myself much about it," Mr. Randall adds, "but very soon, from all parts of the country, there was borne to me, in my remote place of residence, evidence that I had made a great hit, and that, whatever might be the fate of the Confederacy, the song would survive it."

Published in the last days of April, 1861, when every eye was fixed on the border States, the stirring stanzas of the Tyrtæan bard appeared in the very nick of time. There is often a feeling afloat in the minds of men, undefined and vague for want of one to give it form, and held in solution, as it were, until a chance word dropped in the ear of a poet suddenly crystallizes this feeling into song, in which all may see clearly and sharply reflected what in their own thought was shapeless and hazy. It was Mr. Randall's good fortune to be the instrument through which the South spoke. By a natural reaction his burning lines helped "to fire the Southern heart." To do their work well, his words needed to be wedded to music. Unlike the authors of the

"Star-spangled Banner" and the "Marseillaise," the author of "My Maryland" had not written it to fit a tune already familiar. It was left for a lady of Baltimore to lend the lyric the musical wings it needed to enable it to reach every camp-fire of the Southern armies. To the courtesy of this lady, then Miss Hetty Cary, and now the wife of Professor H. Newell Martin, of Johns Hopkins University, I am indebted for a picturesque description of the marriage of the words to the music, and of the first singing of the song before the Southern troops.

The house of Mrs. Martin's father was the headquarters for the Southern sympathizers of Baltimore. Correspondence, money, clothing, supplies of all kinds went thence through the lines to the young men of the city who had joined the Confederate army.

"The enthusiasm of the girls who worked and of the 'boys' who watched for their chance to slip through the lines to Dixie's land found vent and inspiration in such patriotic songs as could be made or adapted to suit our needs. The glee club was to hold its meeting in our parlors one evening early in June, and my sister, Miss Jennie Cary, being the only musical member of the family, had charge of the programme on the occasion. With a school-girl's eagerness to score a success, she resolved to secure some new and ardent expression of feelings that by this time were wrought up to the point of explosion. In vain she searched through her stock of songs and airs — nothing seemed intense enough to suit her. Aroused by her tone of despair, I came to the rescue with the suggestion that she should adapt the words of 'Maryland, my Maryland,' which had been constantly on my lips since the appearance of the lyric a few days before in the South. I produced the paper and began declaiming the verses. 'Lauriger Horatius!' she exclaimed, and in a flash the immortal song found voice in the stirring air so perfectly adapted to it. That night, when her contralto voice rang out the stanzas, the refrain rolled forth from every throat present without pause or preparation; and the enthusiasm communicated itself with such effect to a crowd assembled beneath our open windows as to endanger seriously the liberties of the party."

"Lauriger Horatius" has long been a favorite college song, and it had been introduced into the Cary household by Mr. Burton N. Harrison, then a Yale student. The air to which it is sung is used also for a lovely German lyric, "Tannenbaum, O Tannenbaum," which Longfellow has translated "O Hemlock Tree." The transmigration of tunes is too large and fertile a subject for me

to do more here than refer to it. The taking of the air of a jovial college song to use as the setting of a fiery war-lyric may seem strange and curious, but only to those who are not familiar with the adventures and transformations a tune is often made to undergo.

Hopkinson's "Hail Columbia!" for example, was written to the tune of the "President's March," just as Mrs. Howe's "Battle Hymn of the Republic" was written to "John Brown's Body." The "Wearing of the Green," of the Irishman, is sung to the same air as the "Benny Havens, O!" of the West-Pointer. The "Star-spangled Banner" has to make shift with the second-hand music of "Anacreon in Heaven"; while our other national air, "Yankee Doodle," uses over the notes of an old English nursery rhyme, "Lucy Locket," once a personal lampoon in the days of the "Beggars' Opera," and now surviving in the "Baby's Opera" of Mr. Walter Crane. "My Country, 'tis of Thee," is set to the truly British tune of "God Save the King," the origin of which is doubtful, as it is claimed by the French and the Germans as well as the English. In the hour of battle a war-tune is subject to the right of capture, and, like the cannon taken from the enemy, it is turned against its maker.

To return to "My Maryland": a few weeks after the welding of the words and the music, Mrs. Martin with her brother and sister went through the lines, convoying several trunks full of military clothing, and wearing concealed about her person a flag bearing the arms of Maryland, a gift from the ladies of Baltimore to the Maryland troops in the Confederate army. In consequence of reports which were borne back to the Union authorities, the ladies were forbidden to return. "We were living," so Mrs. Martin writes me, "in Virginia in exile, when, shortly after the battle of Manassas, General Beauregard, hearing of our labors and sufferings in behalf of the Marylanders who had already done such gallant service in his command, invited us to visit them at his headquarters near Fairfax Court House, sending a pass and an escort for us, and the friends by whom we should be accompanied. Our party encamped the first night in tents prepared for us at Manassas, with my kinsman, Captain Sterrell, who was in charge of the fortifications there. We were serenaded by the famous Washington Artillery of New Orleans, aided by all the fine voices within reach. Captain Sterrell expressed our thanks, and asked if there were any service we might render in return. 'Let us hear a woman's voice,' was the cry which arose in response. And, standing in the tent-door, under cover of the darkness, my sister sang

'My Maryland!' This, I believe, was the birth of the song in the army. The refrain was speedily caught up and tossed back to us from hundreds of rebel throats. As the last notes died away, there surged forth from the gathering throng a wild shout—'*We* will break her chains! She *shall* be free! She *shall* be free! Three cheers and a tiger for Maryland!' And they were given with a will. There was not a dry eye in the tent, and, we were told the next day, not a cap with a rim on it in camp. Nothing could have kept Mr. Randall's verses from living and growing into a power. To us fell the happy chance of first giving them voice. In a few weeks 'My Maryland!' had found its way to the heart of our whole people, and become a great national song."

I wish I could call as charming and as striking a witness to set forth the origin of "John Brown's Body." The genesis of both words and music is obscure and involved. The raw facts of historical criticism—names, places, dates—are deficient. The martial hymn has been called a spontaneous generation of the uprising of the North—a self-made song, which sang itself into being of its own accord. Some have treated it as a sudden evolution from the inner consciousness of the early soldiers all aglow with free-soil enthusiasm; and these speak of it as springing, like Minerva from the head of Jove, full-armed and mature. Others have more happily likened it to Topsy, in that it never was born, it grewed; and this latter theory has the support of the facts as far as they can be disentangled from a maze of fiction and legend. A tentative and conjectural reconstruction of the story of the song is all I dare venture upon; and I stand corrected in anticipation.

In 1856 Mr. William Steffe, of Philadelphia, was requested by a fire-company of Charleston, South Carolina, to write an air to a series of verses, the chorus of which began,

"Say, bummers, will you meet us?"

After the air had served its purpose, a new set of words was fitted to it, and it went on its way as a camp-meeting hymn,

"Say, brothers, will you meet us?"

In the four years between the composing of the tune and the outbreak of the war, the camp-meeting hymn had time to become popular throughout the North. Probably—although I have not been able to verify the supposition—"Say, brothers, will you meet us?" (like "Dixie," from which it was soon to part company) served as an air for Lincoln-and-Hamlin campaign songs in the canvass of 1860. Certainly the tune was familiar enough

in New England by the time Lincoln was inaugurated.

John Brown had been hanged in December, 1859. The feeling which that execution called forth in Massachusetts found relief in a meeting at Faneuil Hall. A recent writer has recorded his recollection of that evening, and of the crowd of boys and youths parading the streets of Boston and singing to a familiar air a monotonous lament of which the burden was

"Tell John Andrew,
Tell John Andrew,
Tell John Andrew
John Brown's dead!"

A little more than a year later came the news of the shot against the flag at Sumter. Some memory of this street song seems to have survived, and to have combined chemically with the tune of "Say, brothers, will you meet us?" the time of which was modified to a march; and in this way "John Brown's Body" came into being. It was the song of the hour. There was a special taunt to the South in the use of the name of the martyr of abolition, while to the North that name was as a slogan. As the poet—a prophet again, for once—had written when John Brown was yet alive, though condemned to death:

"But, Virginians, don't do it! for I tell you that the
Flag,
Filled with blood of old Brown's offspring, was
first reared by Southern hands;
And each drop from old Brown's life-veins, like the
red gore of the dragon,
May spring up a vengeful fury, hissing through
your slave-worn lands!
And old Brown,
Osawatimic Brown,
May trouble you more than ever, when you've
rolled his coffin down!"*

If one may rely fully on Major Bosbyshell, to whose interesting paper in the "Grand Army Scout" I am indebted for much valuable suggestion, the song was put together by a quartet of men in the Second Battalion ("Tigers"), a Massachusetts command quartered at Fort Warren, in Boston Harbor, in April, 1861,—just at the time when "My Maryland" was getting itself sung at the South. The quartet, with many others of the "Tigers," enlisted in the Twelfth Massachusetts Volunteers, commanded by Colonel Fletcher Webster. Beyond all question it was the Webster regiment which first adopted "John Brown's Body" as a marching song. The soldiers of this regiment sang it as they marched down Broadway in New York, July 24th, 1861, on their way from Boston to the front. They sang it incessantly until August, 1862, when Colonel Webster died, and when the tune had

been taken up by the nation at large, and hundreds of thousands of soldiers were marching forward to the fight with the name of John Brown on their lips.

There was a majestic simplicity in the rhythm like the beating of mighty hammers. In the beginning the words were bare to the verge of barrenness. There was no lack of poets to fill them out. Henry Howard Brownell, the singer of the "Bay Fight" and the "River Fight," skillfully utilized the accepted lines, which he enriched with a deeper meaning. Then Mrs. Howe wrote her "Battle Hymn of the Republic," perhaps the most resonant and elevated of the poems of American patriotism.† Of late the air has been taken again by Mr. William Morris, poet and socialist, decorator and reformer, as the one to which shall be sung his eloquent and stirring "March of the Workers."

Curiously enough, the history of "Dixie" is not at all unlike the history of "John Brown's Body." "Dixie" was composed in 1859, by Mr. Dan D. Emmett, as a "walk-around" for Bryant's minstrels, then performing at Mechanics' Hall in New York. Mr. Emmett had traveled with circuses, and had heard the performers refer to the States south of Mason and Dixon's line as "Dixie's land," wishing themselves there as soon as the Northern climate began to be too severe for those who live in tents like the Arabs. It was on this expression of Northern circus performers,

"I wish I was in Dixie,"

that Mr. Emmett constructed his song. The "walk-around" hit the taste of the New York play-going public, and it was adopted at once by various bands of wandering minstrels, who sang and danced it in all parts of the Union. In the fall of 1860 Mrs. John Wood sang it in New Orleans in John Brougham's burlesque of "Pocahontas," and in New Orleans it took root. Without any authority from the composer, a New Orleans publisher had the air harmonized and arranged, and he issued it with words embodying the strong Southern feeling of the chief city of Louisiana. As from Boston "John Brown's Body" spread through the North, so from New Orleans "Dixie" spread through the South; and as Northern poets strove to find fit words for the one, so Southern poets wrote fiery lines to fill the measures of the other. Of the sets of verses written to "Dixie," the best, perhaps, is that by General Albert Pike, of Arkansas, who happens, by a fortuitous chance, to have been a native of Vermont. With Republican words "Dixie" had been used as a campaign song

* Steedman in "John Brown of Osawatimic."

Battle-hymn of the Republic.

Mine eyes have seen the glory of the coming of
the Lord:

He is trampling through the vineyard where the
grapes of wrath are stored;

He hath loosed the fatal lightning of his
terrible swift sword

This truth is marching on!

I have seen Him in the watch-towers of an hundred
circling camps:

They have builded Him an altar on the

evening dews and damps;

I have read His righteous sentence by the dim and
flaring lamps.

This day is marching on!

I have read a fiery godhead, writ in burnished rows
of steel

'As ye deal with my contumacious, or with you any
grace shall deal,

Let the hero, born of woman, crush the serpent
with his heel,

Since God is marching on."

He has sounded forth the trumpet that shall
never call retreat;

He is lifting up the hearts of men before his
judgement-seat:

Oh! be swift, my soul, to answer Him! be ju-
bilant, my feet!

Our God is marching on!

In the beauty of the skies Christ was born
across the sea,

To bring a glory in his bosom that transfigures
you and me:

As he died to make men holy, let us die to
make men free,

While God is marching on!

Julia Ward Howe.

in 1862; and it was perhaps some vague remembrance of this which prompted Lincoln to have the air played by a band in Washington in 1865, a short time after the surrender at Appomattox, remarking that as we had captured the rebel army we had captured also the rebel tune.

From New Orleans also came another of the songs of the South, the "Bonnie Blue Flag." Mr. Randall writes me that "Dixie" and the "Bonnie Blue Flag" were the most popular of Southern songs. Like "Dixie," the "Bonnie Blue Flag" came from the theater. The tune is an old Hibernian melody, the "Irish Junting Car." The words were written by an Irish comedian, Harry McCarthy, and the song was first sung by his sister, Miss Marian McCarthy, at the Varieties Theater, in 1861. It was published by Mr. A. E. Blackmar, who writes to a friend of mine that General Butler "made it very profitable by fining every man, woman, or child who sang, whistled, or played it on any instrument, \$25," besides arresting the publisher, destroying the sheet music, and fining him \$500.

In Louisiana, of course, there was also the "Marseillaise." "The Creoles of New Orleans," Mr. Cable writes me, "followed close by the Anglo-Americans of their town, took up the 'Marseillaise' with great enthusiasm, as they have always done whenever a war spirit was up. They did it when the British invaded Louisiana in 1814. It was good enough as it stood; they made no new adaptations of it, but sang it in French and English (I speak of 1861), 'dry so,' as the Southern rustics say. 'Dixie' started with the first mutter of war thunder. . . . I think the same is true of 'Lorena.' This doleful old ditty started at the start, and never stopped till the last musket was stacked and the last cannon-fire cold. It was, by all odds, the song nearest the Confederate soldier's heart. It was the 'Annie Laurie' of the Confederate trenches."

Nowadays it is not a little difficult to detect in the rather mushy sentimentality of the words of "Lorena," or in the lugubrious wail of its music, any qualities which might account for the affection it was held in. But the vagaries of popular taste are inscrutable. Dr. Pomeroy's vigorous lyric, "Stonewall Jackson's War," written within sound of the cannonading at Antietam, was so little sung that Mr. Randall thought it had not been set to music. I have, however, succeeded in discovering two airs to which it was sung,—one published by Mr. Blackmar, and the other the familiar "Duda, duda, day."

The Northern equivalent of "Lorena" is to be sought among the songs which made a

lyric address to "Mother," and of which "Just before the Battle, Mother," may be taken as a type. "Mother, I've Come Home to Die," was sung with feeling and with humor by many a gallant fellow who is now gathered at the bivouac of the dead. Mr. George F. Root, of Chicago, was both the author and composer of "Just before the Battle, Mother," as he was also of the "Battle Cry of Freedom," and of "Tramp, Tramp, Tramp; the Boys are Marching." It is difficult to say which one of these three songs was the most popular; there was a touch of realistic pathos in "Just before the Battle, Mother," which brought the simple and unpretending words home to the hearts of the men who had girded on the sword and shouldered the musket. Yet captivity was not seldom more bitter to bear than death itself, and this gave point to the lament of the soldier who sat in his "prison-cell" and heard the tramp, tramp, tramp of the marching boys. Probably, however, the first favorite with the soldiers in the field, and certainly the song of Mr. Root's which has the best chance of surviving, is the "Battle Cry of Freedom." It was often ordered to be sung as the men marched into action. More than once its strains arose on the battlefield and made obedience more easy to the lyric command to rally round the flag. With the pleasant humor which never deserts the American, even in the hard tussle of war, the gentle lines of "Mary had a Little Lamb" were fitted snugly to the tune; and many a regiment shortened a weary march or went gayly into action, singing,

"Mary had a little lamb,
Its fleece was white as snow,
Shouting the battle cry of freedom;
And everywhere that Mary went
The lamb was sure to go,
Shouting the battle cry of freedom."

Now the song is sure of immortality, for it has become a part of those elective studies which are the chief gains of the college curriculum. At the hands of the American college boys, "Rally round the Flag" can get a renewed lease of life for twenty-one years more—or forever. A boy is your true conservative; he is the genuine guardian of ancient rites and customs, old rhymes and songs; he has the fullest reverence for age—if so be it is not incarnated in a "Prof." or a "Prex." Lowell, in declaring the antiquity of the New World, says that "we have also in America things amazingly old, as our boys, for example." And the taking of the "Battle Cry of Freedom" by the colleges is only the fair exchange which is no robbery; for, as we have seen, it was from the college that the air of "Lauriger Horatius" was taken to speed the

Three hundred thousand more.

We are coming Father Abraham three hundred thousand more,
From Mississippi's winding stream and from New England's shore;
We leave our ploughs and workshops, our wives and children dear,
With hearts too full for utterance, with but a silent tear;
We dare not look behind us, but steadfastly before—
We are coming Father Abraham three hundred thousand more!

If you look across the hill tops that meet the northern sky,
Long, moving lines of rising dust your vision may descry;
And now the wind an instant tears the cloudy veil aside,
And floats aloft our spangled flag, in glory and in pride;
And baronets in the sunlight gleam, and bands brave music pour,
We are coming Father Abraham three hundred thousand more!

If you look all up our valleys where the growing harvests shine,
You may see our sturdy farmer boys fast forming into line;
And children from their mothers' knees are pulling at the weeds,
And learning how to reap and sow, against their country's needs;
And a farewell group stands weeping at every cottage door—
We are coming Father Abraham three hundred thousand more!

You have called us and we're coming, by Richmond's bloody tide,
To lay us down for freedom's sake, our brothers' bones beside;
Or from foul treason's savage grasp to wrench the murderous blade,
And in the face of foreign foes its fragments to parade.
Six hundred thousand loyal men and true have gone before—
We are coming Father Abraham three hundred thousand more!

Autograph

W. L. Garrison

"Brave Boys are They." The latter has had the honor of being sung of late by Mr. Cable, who heard first at a Southern camp-fire from the lips of a comrade the chorus of Northern origin, equally apt in its application in those troublous times to the homes on either side of Mason and Dixon's line:

"Brave boys are they,
Gone at their country's call;
And yet—and yet we cannot forget
That many brave boys must fall."

It was in the dark days of 1862, just after Lincoln had issued the proclamation asking for three hundred thousand volunteers to fill up the stricken ranks of the army and to carry out the cry which urged it "On to Richmond," that Mr. John S. Gibbons wrote

"We are coming, Father Abraham,
Three hundred thousand more,"

a lyric which contributed not a little to the bringing about of the uprising it declared. The author of this ringing call to arms was a Hicksite Quaker,— "with a reasonable leaning, however, toward wrath in cases of emergency," as his son-in-law, Mr. James H. Morse, neatly puts it, in a recent letter to me. He joined the abolition movement in 1830, when he was barely twenty years old. Three years later he married a daughter of Isaac T. Hopper, the Quaker philanthropist. For a short time he was one of the editors of the "Anti-Slavery Standard," and, like many of the Quakers of his school, he was always ardent in the cause of negro freedom. At the outbreak of the war, Mrs. Gibbons and her eldest daughter went to the front, and they served in the hospitals until the end. While they were away the riots of '63 occurred, and their house in New York was sacked, Mr. Gibbons and the two younger daughters taking refuge with relatives in the house next door but one, and thence over the roofs to Eighth Avenue, where Mr. Joseph H. Choate had a carriage in waiting for them. The house was singled out for this attention because it had been illuminated when the Emancipation Proclamation was issued,—on which occasion it had been daubed and defiled with coal tar.

At the request of Mr. Morse, Mr. Gibbons has put on paper an account of the circumstances under which he wrote "We are coming, Father Abraham," and from this I am privileged to quote. It must be premised that Mr. Gibbons, although he had written verse—as who has not?—was best known as a writer on financial topics: he has published two books about banking, and he was for a while the financial editor of the "Evening Post." In

1862, after Lincoln had issued his call for volunteers, Mr. Gibbons used to take long walks alone, often talking to himself. "I began to con over a song," he writes. "The words seemed to fall into ranks and files, and to come with a measured step. Directly would come along a company of soldiers with fife and drum, and that helped the matter amazingly. I began to keep step myself—three hundred thousand more.—It was very natural to answer the President's call—we are coming—and to prefix the term *father*. Then the line would follow

'We are coming, Father Abraham,'

and nothing was more natural than the number of soldiers wanted.

'Three hundred thousand more.'

'We are coming, Father Abraham, three hundred thousand more.'

"Where from? *Shore* is the rhyme wanted."

Just then Mr. Gibbons met "a Western regiment—from Minnesota, it was—and the line came at once in full,

'From Mississippi's winding stream, and from New England's shore.'

"Two lines in full . . . Then followed—how naturally!

'We leave our plows and workshops, our wives and children dear,
'With hearts too full for utterance, with but a silent tear.'

"And so it went on, word by word, line by line, until the whole song was made." When it was written, only one slight verbal alteration was made, and then it was printed in the "Evening Post" of July 16th, 1862. It is interesting to note that it was in the "Evening Post" of May 29th, 1819, nearly half a century before, that another famous patriotic poem had first been published—Drake's "American Flag." Mr. Gibbons's song appeared anonymously, and its authorship was ascribed at once to Bryant, who was then the editor of the "Evening Post." At a large meeting in Boston, held the evening after it had appeared, it was read by Josiah Quincy as "the latest poem written by Mr. Wm. C. Bryant."

One of the Hutchinson family set it to music, and they sang it with great effect. A common friend told Jesse Hutchinson that the song was not by Bryant but by Mr. Gibbons. "What—our old friend Gibbons?" he asked in reply. It is said that when assured that his old friend Gibbons was the real author of the song, Jesse Hutchinson hesitated thoughtfully for a moment and then said, "Well, we'll keep the name of Bryant as we've got it. He's better known than Gibbons." The stirring song was

set to music by several other composers, most of whom probably supposed that it was Bryant's. I find in a stray newspaper cutting an account of Lincoln's coming down to the Red Room of the White House one morning in the summer of 1864, to listen with bowed head and patient pensive eyes while one of a party of visitors sang

"We are coming, Father Abraham, three hundred thousand more."

A rattling good war song which has kept its hold on the ears of the people is "When Johnny comes Marching Home," written in 1863 by "Louis Lambert." Behind this pseudonym was hidden Mr. P. S. Gilmore, the projector of the Boston "Peace Jubilee," and the composer afterward of a more ambitious national hymn, which has hitherto failed to attain the popularity of its unpretending predecessor with the rousing refrain. It is related that after the performance of "Glory to God on High," from Mozart's Twelfth Mass, on the first day of the Jubilee, an old soldier of the Webster regiment took occasion to shake hands with Mr. Gilmore and to proffer his congratulations on the success of the undertaking, adding that for his part what he had liked best was the piece called the "Twelfth Massachusetts."

At the Boston Peace Jubilee, and again at the Centennial Exhibition, there was opportunity for the adequate and serious treatment

of the war tunes which have survived the welter and turmoil of the actual strife; but the occasion was not improved. Little more has been done than a chance arrangement of airs in the clap-trap manner of Julien's "British Army Quadrilles." The "Centennial March" which Richard Wagner wrote for us was the work of a master, no doubt, but it was perfunctory, and hopelessly inferior to his resplendent "Kaiser March." The German composer had not touch of the American people, and as he did not know what was in our hearts, we had no right to hope that he should give it expression. The time is now ripe for the musician who shall richly and amply develop, with sustained and sonorous dignity, the few simple airs which represent and recall to the people of these United States the emotions, the doubts, the dangers, the joys, the sorrows, the harassing anxieties, and the final triumph of the four long years of bitter strife. The composer who will take "John Brown's Body" and "Marching through Georgia," and such other of our war tunes as may be found worthy, and who shall do unto them as the still living Hungarian and Scandinavian composers have done to the folk-songs of their native land, need not hesitate from poverty of material or from fear of the lack of a responsive audience. The first American composer who shall turn these war tunes into mighty music to commemorate the events which called them forth, will of a certainty have his reward.

Brander Matthews.

NOTE ON THE "BATTLE HYMN OF THE REPUBLIC."

[At the request of the Editor, Mrs. Howe has prepared the following account of the circumstances attending the origin of the "Battle Hymn of the Republic."]

IN December, 1861, the first year of our Civil War, I made a journey to Washington in company with Dr. Howe, Governor and Mrs. John A. Andrew, and other friends. I remember well the aspect of things within what might then have been termed "the debatable land." As our train sped on through the darkness, we saw in vivid contrast the fires of the pickets set to guard the line of the railroad. The troops lay encamped around the city, their cantonments extending to a considerable distance. At the hotel, officers and their orderlies were conspicuous, and army ambulances were constantly arriving and departing. The gallop of horsemen, the tramp of foot-soldiers, the noise of drum, fife, and bugle, were heard continually. The two great powers were holding each other in check, and the very air seemed tense with expectancy. Bull Run had shown the North that any victory it might hope to achieve would be neither swift nor easy. The Southern leaders, on the other hand, had already learned something of the determined temper and persistent resolve of those with whom they had to cope.

The one absorbing thought in Washington was the army, and the time of visitors like ourselves was

mostly employed in visits to the camps and hospitals. Such preaching as we heard was either to the soldiers or about them and the issues of the war. Such prayers as were made were uttered in stress and agony of spirit, for the war itself was a dread sorrow to us.

It happened one day that, in company with some friends, among whom was the Rev. James Freeman Clarke, I attended a review of our troops, at a distance of several miles from the city. The manœuvres were interrupted by a sudden attack of the enemy, and instead of the spectacle promised us, we saw some reinforcements gallop hastily to the aid of a small force of our own, which had been surprised and surrounded.

Our return to the city was impeded by the homeward marching of the troops, who nearly filled the highway. Our progress was therefore very slow and to beguile the time, we began to sing army songs, among which the John Brown song soon came to mind. Some one remarked upon the excellence of the tune, and I said that I had often wished to write some words which might be sung to it. We sang, however, the words which were already well known as belonging to it, and our singing seemed to please the soldiers, who surrounded us like a river, and who themselves took up the strain, in the intervals crying to us: "Good for you."

I slept as usual that night, but awoke before dawn the next morning, and soon found myself trying to

weave together certain lines which, though not entirely suited to the John Brown music, were yet capable of being sung to it. I lay still in the dark room, line after line shaping itself in my mind, and verse after verse. When I had thought out the last of these, I felt that I must make an effort to place them beyond the danger of being effaced by a morning nap. I sprang out of bed and groped about in the dim twilight to find a bit of paper and the stump of a pen which I remembered to have had the evening before. Having found these articles, and having long been accustomed to scribble with scarcely any sight of what I might write in a room made dark for the repose of my infant children, I began to write the lines of my poem in like manner. (I was always careful to decipher these lines within twenty-four hours, as I had found them perfectly illegible after a longer period.) On the occasion now spoken of, I completed my writing, went back to bed, and fell fast asleep.

A day or two later, I repeated my verses to Mr. Clarke, who was much pleased with them. Soon after my return to Boston, I carried the lines to James T. Fields, at that time Editor of the "Atlantic Monthly." The title, "Battle Hymn of the Republic," was of his devising. The poem was published soon after in the magazine, and did not at first receive any especial mention. We were all too much absorbed in watching the progress of the war to give much heed to a copy of verses more or less. I think it may have been a year later that my lines, in some shape, found their way into a Southern prison in which a number of our soldiers were confined. An army chaplain who had been imprisoned with them came to Washington soon after

his release, and in a speech or lecture of some sort, described the singing of the hymn by himself and his companions in that dismal place of confinement. People now began to ask who had written the hymn, and the author's name was easily established by a reference to the magazine. The battle hymn was often sung in the course of the war, and under a great variety of circumstances. Among other anecdotes, I have heard of its having once led a "forlorn hope" through a desperate encounter to a successful issue.

The wild echoes of the fearful struggle have long since died away, and with them all memories of unkindness between ourselves and our Southern brethren. But those who once loved my hymn still sing it. In many a distant Northern town where I have stood to speak, the song has been sung by the choir of some one of the churches before or after my lecture. I could hardly believe my ears when, at an entertainment at Baton Rouge which I shared with other officers of the New Orleans Exposition, the band broke bravely into the John Brown tune. It was scarcely less surprising for me to hear my verses sung at the exposition by the colored people who had invited me to speak to them in their own department. A printed copy of the words and music was once sent me from Constantinople, by whom, I never knew. But when I visited Roberts College, in the neighborhood of that city, the good professors and their ladies at parting asked me to listen well to what I might hear on my way down the steep declivity. I did so, and heard, in sweet, full cadence, the lines which scarcely seem mine, so much are they the breath of that heroic time, and of the feeling with which it was filled.

Julia Ward Howe.

TOPICS OF THE TIME.

An Urgent Measure of National Defense.

ASIDE from the construction of ships and fortifications, to which there is reason to believe that the next Congress will give serious attention, the most pressing question of national defense relates to the naval *personnel*. Not that our officers and blue-jackets are of inferior quality: far from it. Given the materials necessary for training in modern war, and our naval force, as far as it goes, will challenge comparison with any of its rivals. The difficulty is not that it is inefficient, but that it is insufficient. It is a mere nucleus, a navy on a peace footing. Alike in the Revolution, when our enemy had a powerful navy, and in the Civil War, when he had no navy at all, the Government felt from the outset to the close the urgent want of a large body of trained man-o'-war's-men. Men were gradually enlisted, but the absence of a previous enrollment made it difficult and expensive to get them, and the absence of a previous training deferred the period of their efficiency until long after they were got.

In accordance with that sound maxim of American policy which forbids the maintenance of a large stand-

ing force, our regular army will probably never exceed twenty or thirty thousand men, and our regular navy ten or twelve thousand. But the army makes up for its small size by an ample reserve, composed of a well-organized, well-equipped, and well-trained militia. If a war should break out to-morrow, it would be easy to put into the field, in the course of a fortnight, from fifty to one hundred thousand men, officered, armed, and, to some extent, trained for war. They would be raw troops, no doubt, but they would still be troops: all the preliminary work—the enrollment, by which the Government could lay hands on them immediately, the arrangement in working organizations, the elementary training—would have been provided for beforehand, and when the crisis came, would be an accomplished fact.

The navy, on the other hand, upon which the country must place its first reliance for defence, whose forces are always scattered, and whose statutory number, of seven thousand five hundred seamen, falls short of actual peace requirements, is absolutely without a provision for enlargement. In our population of sixty millions there is not a single individual known to the

Navy Department by name, residence, or occupation,—and much less is there any organization,—upon whom or upon which it could call in an emergency to perform duty in ships of war. Plenty of men there doubtless are who would be glad to offer their services, and who might in the course of time be enlisted, assigned to duties, and made available for purposes of training; but the enlistment and assignment of any large number would take two months at least, and the training would require a month or two more. During the four months thus consumed, a properly prepared enemy would have destroyed all our construction-yards and naval stations, to say nothing of our commerce and our commercial cities.

To remedy this glaring defect, a plan must be prepared which shall receive the substantial approval of the mercantile and maritime community on the one hand, and of the Government on the other; for these are the two forces whose cooperation is necessary to insure success. Its two underlying features are the enrollment of volunteers from the merchant service, the fishing fleet, and the yacht squadrons, as officers, petty officers, and seamen of the United States Naval Reserve; and secondly, their training from time to time, for short periods—three weeks or a month at the most—in regularly commissioned ships of war, organized, if possible, as a squadron of evolutions. The volunteers should receive compensation while actually in service, and, the period of training finished, they should be free to return to their vocations, retaining their connection with the service by a permanent registration. The details of the plan require careful deliberation, but they present no serious difficulties, and call for no great outlay. Registers opened at the commercial seaports should be inscribed with the names of those desiring to associate themselves with the naval reserve. The Navy Department should devote to the work some of the modern ships of which its home squadron will shortly be composed, with selected officers in sufficient numbers to provide for the instruction of the volunteers. The latter, wearing the uniform of the service, and subject to its regulations, would perform their tour of duty at periods that would cause the least possible interruption of their ordinary occupations.

The plan would not make sailors out of landmen, but that would not be its object. The volunteers, being seafaring men, already know half their business, and they would be given an opportunity to learn the other half,—the handling of weapons, the routine and discipline of a ship of war, and the intelligent use of its manifold mechanical appliances. The adoption of such a plan would enable the Government, at the first sign of war, to fit out at once all the ships laid up at its yards, instead of marking time while its squadrons returned from distant stations, or, worse still, while Congress deliberated upon the best method of mobilizing a force that was not yet organized, trained, or even recruited. Certainly no measure of national defence is more reasonable or practical than this, and there is none that calls more urgently for immediate action.

The Niagara Reservation.

FEW public measures, based upon considerations other than those of economic benefit, have met with such wide-spread and hearty approval as has greeted

the establishment of the Niagara Reservation. No question involving simply the public's chances of future pleasure can have a greater interest than the question, What now is to be done with this property which the people of the State of New-York hold in trust for the people of all the world?

Entrance-fees have already been abolished, and many eyesores and incumbrances in the shape of mills and fences and vulgar places of amusement have already been removed. But it will easily be understood that a great deal of further work—and of a constructive as well as of a destructive character—will be required if the Reservation is to show that its owners appreciate its value and the responsibility which its possession lays upon them. We are sorry to say that there is no immediate prospect of this work being undertaken. That is, no money has yet been appropriated by the Legislature to begin it. But the Board which has the Reservation in charge has accepted the plan of improvement suggested by the landscape artists to whose consideration the matter was submitted;* and we think it only needs that the outlines of this plan should be laid before the public to excite a strong wish that it shall as soon as possible be put in execution. Seldom, we think, has a task of the kind been approached in a spirit which so unites common sense with artistic feeling, and so carefully holds the balance true between what is due to the property itself and what is due to the persons who will visit it.

The problem was by no means an easy one to master. Its very first theoretic stages were, indeed, simple enough. Of course, as Messrs. Olmsted and Vaux begin by saying, it is desirable “that whatever is done shall tell toward a general result that shall be lastingly satisfactory, nothing being wasted on matters of temporary expediency”; and of course this means that preparation must be made for the presence of even greater crowds of visitors than have been in the habit of assembling in the past. Again, it is obvious that “the greatest good of the greatest number” is the one aim to be kept in view. The rights of local property-owners have already been made to yield to it; and to it must be subordinated also the privileges of individual tourists in so far as they seem likely to conflict with general enjoyment.

Up to this point no great difficulty presented itself. But then to decide what really is the greatest good in such a case, and, this having been settled, so to elaborate a plan of improvement that it might be thoroughly well secured, but that individual privileges might be interfered with no more than strict necessity compelled, and in such a manner as to excite the least possible feeling of constraint in the most selfish of tourists—these were matters which demanded the exercise of patient thought, clear judgment, wise foresight, and that practical knowledge which could only have grown from long experience with similar problems.

As revealed in their lucid, full, and logical statement,

* “General Plan for the Improvement of the Niagara Reservation.” New York: Martin B. Brown, 49 & 51 Park Place. 1887. (A pamphlet containing the report addressed to the Hon. William Dorsheimer, President of the Board of Commissioners of the State Reservation at Niagara, by Frederick Law Olmsted and Calvert Vaux, Landscape-architects; and a large map of the property as it will appear if remodeled in accordance.)

Messrs. Olmsted and Vaux's primary idea is that the greatest good which they can secure to their clients is the enjoyment of natural scenery in as pure and undiluted an aspect as the decent, safe, and comfortable accommodation of great throngs of visitors will permit. That is to say, people will in future be expected to come to Niagara to look at Niagara, not to picnic or to play, and not to gaze at mountebanks, or peep-shows, or "galleries of art," or collections of natural curiosities. And they will be shown it as nearly as possible as nature made it, neither desecrated nor, in the cant sense, "improved," and under the beams of the sun and moon, but never again of colored calcium-lights. Its beauty and its wonderfulness are to be given the freest chance to speak to our emotions, while the petty and discordant tones of humanity's creations are as much as possible to be suppressed. And, with keen artistic taste, this rule is so extended as to war against all artificial accentuation of natural charms, all deliberate emphasizing of natural impressions. Every opportunity will be given the visitor to see all there is to see, but no effort will be made to enhance astonishment, to excite amazement, or to stimulate mere curiosity.

Surely these decisions are wise. So, also, is the cogent decision that, as "the more artificial features fill the eye the less will be the effect of natural features," no object or arrangement "of an artificial character should be allowed a place on the property, no matter how valuable it might be under other circumstances, and no matter at how little cost it may be had, the presence of which can be avoided consistently with the provision of necessary conditions for making the enjoyment of the natural scenery available." Those objects and arrangements which, in the pursuance of this end, cannot be avoided will be only too numerous, and will be only too conspicuous despite the care that will be taken to make them unobtrusive in both form and color. Roads and walks must be constructed in greater numbers than they exist to-day, if all other portions of the surface are to be guarded as carefully as they should be—much more carefully, that is, than they have been in the past. Standing and turning places for carriages must be laid out. Abundant seats and various bridges and stairways are of course a necessity. Shelters must be built containing ample accommodations for the guardians of the place and for the comfort of the greatest possible crowds of visitors. Especially when the narrowness of the long belt which forms the Reservation is considered, do we feel how wise, therefore, is the judgment which would exclude all other objects save those which nature intended the ground to bear; not only all appliances for "amusement," but all works of art, all exotic ornamental trees and shrubs, all "decorative" flower-beds,—everything that could further interfere with the natural aspect of the place or (quite as important a point) could attract the eye to details when it should be contemplating broad general effects.

Another thing which this precept obliges (and which the comfort of the great body of visitors also necessitates) is that there shall be no places of entertainment, or of more than temporary shelter except at the very entrance of the Reservation, and that stringent care shall be taken to prevent the monopolizing of attractive spots by picnic parties and the littering of the ground with sandwich-papers, soda-water bottles, and

tomato-cans. Vast numbers of people—sometimes as many as ten thousand a day—come every summer for a brief look at the Falls, who neither would nor could come were they obliged to refresh and rest themselves at the village hotels. For these, and their babies and baskets, ample and even luxurious accommodation will be provided in a large (but low) reception-building at the entrance to the Reservation in the Upper Grove, and in adjacent half-open pavilions. But beyond these buildings no carrying of food will be permitted, and nowhere else will it be supplied. The hardship resulting from this rule will be very small, for the distance from the site of the old eating-house on Goat Island to the new reception-rooms or to the village hotels is scarcely greater than a ten minutes' walk will cover. In truth, it will be no hardship but a positive benefit to the average unthinking tourist if he is thus persuaded to rest and refresh himself before he does his sight-seeing.

The good sense shown by another decision is perhaps less immediately obvious, but is quite as evident when the reasons for it are studied in the report and by the aid of the map. Involving as they do calculations with regard to the numbers who are likely to visit the Reservation in future years, statements as to the insecurity of certain portions of the water-front, descriptions of the lay of the ground in various directions, and a balancing of the relative claims of accommodation and of natural beauty, these reasons are far too long and complicated to be quoted here. But they clearly show, we repeat, the wisdom of the decision that the carriage-drives and halting-places, both on the mainland and on Goat Island, shall be kept a little away from the shore, and that the best points of view shall be approachable only on foot. Nor is the hardship which this decision may seem to involve much more than an apparent one. To make some thirty paces on foot is but a small exertion for the able-bodied, and wheeled chairs are to be supplied for the use of invalids. The greatest good of the greatest number will be promoted by this arrangement almost more than by any other that is proposed.

One or two additional intentions may be noted. All hazardous points along the brink will be rendered as safe as possible, and carefully guarded against overcrowding. All plantings will be made with native trees in desirable variety, more regard being paid to permanent than to speedily effective results; and they will be so arranged as to screen off the village from the Reservation, while allowing constant views or glimpses of the water from all the roads and paths. The shore line above the falls will be restored to naturalness of aspect and protected against the encroachment of the water in inconspicuous ways. The present staircase to the Cave of the Winds will be retained for immediate use; but as the recession of the cliff will eventually necessitate its removal, it is advised that at some future day a shaft and tunnel containing an elevator should be built, the entrance to be placed some fifty feet from the edge of the bank. Further to reduce the inconveniences and expenses which hitherto have afflicted the tourist, a cheap omnibus-service will be established, and modest guide-posts will direct pedestrians.

This then, in its main outlines, is the scheme for the execution of which we hope the next Legislature will

be asked to vote sufficient funds. Of course not every thing which it suggests need be done at once; but with regard to some things there is the greatest necessity for immediate action. It is especially desirable, for instance, that the new drives on Goat Island should be at once constructed, for those which exist are so insufficient that visitors are seriously inconvenienced, and many intervening stretches of ground are month by month more seriously injured by trampling feet. But the truth is that there is scarcely a yard of the entire Reservation which does not need treatment of some sort—either for alteration or for conservation; and as all the work requires much time for its completion, none of it can be begun too soon.

Even after it is, so to say, completed, much additional time must elapse before its full results will be apparent. For a landscape-artist must wait years for his labors to finish themselves after he has finished upon the soil the plan he had sketched on paper. The main thing, therefore, is, to begin. But when once we have begun, the main thing will be to remember through all coming years that the property must not only be made, but kept, what its wisely chosen name implies,—*a piece of nature defended as strictly as possible against all*

intrusion of artificiality. As such it will have no more room for certain kinds of beauty to display themselves than for any kind of ugliness. To try to prettify it with fountains and statues, and exotic shrubs and brilliant flower-beds, would be as unwise, as inartistic, and as vulgar almost, as to try to add to its attractions by merry-go-rounds and menageries, and illuminations, and ice-cream stalls. One feels sure that the Reservation will never again wear that disgraceful resemblance to a country fair-ground which it has worn so long. But we wish one could feel just as sure that it will never be made into a park or a garden or a pleasure-ground of any kind, even the most sumptuously "aristocratic."

We wish too that it were entirely certain, that if the year of Queen Victoria's jubilee is indeed to be signalized by the forming of a Government Reservation on the Canada shore, this too will be planned and managed in accordance with this general idea. The views from the Canada bank are much more extensive and imposing than those from our own. There is all the greater reason, therefore, why their effect should not be lessened by "ornamental" park-like foregrounds, or forced into unworthy rivalry with the attractions of places of amusement and bodily refreshment.

OPEN LETTERS.

Education of the Blind.

NO. I. AS CHILDREN.

NOTWITHSTANDING the attention given to this subject during the past two or three decades by able and philanthropic persons, and the excellent work in certain directions and within certain limits now done in many of our State institutions, the matter is still but very imperfectly understood, even by those who make it a specialty, and scarcely at all by the general public. Yet it is one of almost universal interest. There are, comparatively speaking, but few families in this or any other country which are not sooner or later, directly or indirectly, called upon to exercise their thoughts and sympathies in behalf of some afflicted member, friend, or acquaintance, for whom, in their ignorance of possibilities and precedents, they entertain the most exaggerated compassion, the most needlessly doleful and hopeless ideas.

The experience and observation of many years enable me to speak with definite, vivid, personal knowledge upon this theme; and though I have by no means the intention, nor perhaps the ability, to formulate a complete system of study and training for those deprived of sight, I may possibly, by a few practical suggestions, throw a little light into some darkened existences, render less appalling the rear of life's battle to some about entering it under fearful disadvantages, or show a gleam of hope to the heavy heart of some discouraged mother, who sees her child, in all the glad bright promise of the future which her fond maternal pride has pictured in advance, entombed alive in midnight blackness, blighted with the curse of useless, joyless dependence—for such its fate appears to her. If I can succeed in giving aid or comfort to any of these, my labor will be repaid tenfold.

The chief difficulty in the past, and perhaps an unavoidable one in the way of more satisfactory results in the education of the blind as a class, has been that most of the theorizing and experimenting, as well as the practical work in this direction, has been done by seeing persons, who are never wholly able to divest their minds of certain prejudices and misapprehensions with regard to those under their charge, nor to enter fully into their real condition and actual needs. Many of them have been intelligent and earnestly devoted to their task, and a few have really hit upon some very rational projects and ingenious contrivances to ameliorate the condition and add to the comfort of their pupils and protégés; but the majority have been led astray by erroneous conceptions of the state with which they had to deal, which rendered their best-meant endeavors fruitless; while no small number have been fantastic dreamers or pig-headed hobbyists, erratic cranks of every description, who have either used this form of philanthropy as an easy means of gaining a livelihood, or have regarded the unfortunates under their charge as only important in the light of suitable and legitimate subjects for every variety of experiment, psychological and physical, from fanatical, monomaniac piety, to hydropathy.

Some of the theories put in practice, in defiance of common sense, by men whom the state supports and the public applauds, would be boundlessly ludicrous, if their results were not pitifully sad. For instance, the superintendent of a large and richly endowed institution for the blind at Naples maintains that all sightless persons should be kept in utter ignorance of sight; that in justice and mercy they should never be allowed to know what they miss,—that is, should never be permitted to meet, either in their specially prepared

literature or conversation, any reference whatever to light, color, or any purely visible phenomena; in short, should never be told of anything which they cannot themselves hear, taste, or touch; should live in vast cloister-like asylums, supported by charity, strangers to every experience of actual life — pictures, scenery, sight itself, to them unknown, even by name. Following this theory out to its logical conclusion, it is difficult to comprehend how any brain outside a madhouse could conceive it, still less harbor it for a moment; yet upward of three hundred wretches are to-day being *educated*, as it is termed, in accordance with this theory.

Another superintendent of a similar establishment in Germany told the writer, not long since, that "prayer and Christian resignation" were the only things of value which the blind could learn or practice; that for them, as for the lepers of old, life in this world was over, and it was their duty and privilege to fit themselves early for the next; that any effort to change their condition materially, besides being entirely fruitless, would be equivalent to rebellion against the restrictions of their divinely appointed sphere. In his establishment, therefore, the chief and only important exercise of the pupils was to kneel regularly every half-hour at the stroke of a bell and mutter through a lot of senseless prayers, learned by rote, to render them more contented with their lot and resigned to its necessary limitations, as was claimed by their judicious instructor, who, like many others, was entirely satisfied with divine restrictions for other people.

In America the conditions, prospects, and educational opportunities of this numerically important class are of course incalculably superior to those in Europe. There the outlook, even to the casual observer, is hopeless and heart-rending; here it presents many elements of encouragement. Our sound national common sense helps us to take the lead in this, as in most practical matters; but we have still very much to test and demonstrate.

An important source of misunderstanding and consequent mismanagement in dealing with the blind, especially as children, is the exaggerated sympathy and commiseration felt and expressed toward them by parents, teachers, and others. Those to whom total darkness is synonymous with mental depression, vague terror, and utter physical helplessness, naturally suppose that never to see the light at all must mean positive, poignant, perpetual misery. To them it would, for a time at least; and they cannot realize how completely circumstances alter cases. The blind child knows nothing of this feeling, and never would, if it were not dinned into his ears by the stupid, over-officious kindness of those about him. He is accustomed to his condition, has pretty much forgotten or has never known any other, and lives his life contentedly enough within its necessary limitations, unconscious of any lack, save when reminded of it by some practical difficulty to be overcome, or, far oftener and more painfully, by the injudicious remarks and demeanor of others. Many a day that for him would have passed cheerfully, filled with play or study, without a thought of his misfortune, is embittered and made wretched by a few ill-timed, ill-chosen words from some well-meaning friend or curious neighbor. For he is, as a rule, abnormally sensitive upon this score; and though it

should be his aim and that of his guardians to overcome this tendency, it cannot be done by continually and heedlessly irritating the sore spot.

Let him alone; treat him and think of him as if he were not different from other children, and he will become far less so than you suppose. Assume that he is to feel, think, and enjoy as others do, and he will surprise you by the clearness of his perceptions, the accuracy of his intuitions, and the thoroughness of his participation in things which you had supposed were wholly beyond his scope. Help him to forget or ignore rather than to realize and lament his infirmity; not by anxiously avoiding every subject that has any connection with sight, but by tacitly granting that he has other not necessarily inferior means of obtaining the same impressions of the outer world as yourself, which is approximately true. You will thus greatly contribute not only to his practical well-being and personal comfort, but to his good opinion of your own tact. It may be here remarked that the sufferer from blindness or other bodily affliction is always able to gauge the taste and breeding of those he meets by the length of time it takes them to get round to this, for him, disagreeable topic. With the coarse, illiterate man, it is the first and about the only thing spoken of; others arrive at it by more or less ingenious colloquial meanderings, displaying a rude curiosity behind a flimsy veil of every degree of transparency. Comparatively few succeed in overlooking it altogether, and these are proportionally appreciated. Fred Douglas is reported to have said: "I regard Mr. Lincoln as the finest gentleman I ever met, for he is the only one who never directly or indirectly reminded me of my color," a pregnant and suggestive remark, well worth a second thought.

Another terrible obstacle to the proper development of the blind is the overweening caution of their friends for them, and the unreasonable, incredulous distrust of their capabilities which they must meet on every hand, and either combat, with all but superhuman energy, or succumb to, as they, alas, too often do. One is reminded of a man who has all his life long taken the same local paper, till he has come to live in and swear by it, and finds it impossible to believe that his neighbor, who subscribes for a rival sheet, can be posted upon current events, or capable of judging of anything, merely because his communication with the world is through a different medium. Those who have all their lives been in the habit of depending upon sight for everything, from the study of philosophy and the Scriptures to the tying of a shoestring, cannot seem to understand that hearing and touch may with practice be made to serve nearly all purposes about as well, and some very much better. For example, because they cannot find the door of their own parlor at first trial if the lamp suddenly goes out, they consider it incredible that a person without sight can go all over a large city alone as independently and safely as they; yet he finds it just as hard to believe or understand that they can tell, through the glass of a closed window, how many persons are in a passing carriage, or whether the gas is lighted, from the other side of the room. Both judge from limited personal experience, a very unreliable criterion when applied to things outside its range. The fact is that the blind child, if given a chance, will discover or develop

means to do nearly everything that others do, in its own way and with somewhat more trouble, it is true, but well enough for all practical needs and for its own satisfaction. If not hemmed in at every turn, anticipated in every wish and effort, warned against and prevented from making every self-reliant attempt, the sightless child will gradually attain to an independence as natural and necessary to his well-being as it is marvelous to his over-anxious friends. Here, again, leave him to himself; let him meet his own necessities, find his limitations, test and train his powers. Let him hunt his own lost playthings, even if he be slow about it, and your tender patience be tried almost beyond bearing by the spectacle. Let him grope for them; the next time it will not take half so long, and in ten years he will find a dropped coin or cuff-button as quickly as you can. Let him help himself at table, at the toilette, and on all occasions as others do. Let him go alone, not only over house and grounds, which many think so wonderful, but on the streets of town or city, wherever he pleases and others of his age are allowed to go. Encourage him to compete with them in all they undertake, whether physical or intellectual, and he will very likely astonish you often by excelling them. In a word, help him to independence, the first essential of his happiness, the corner-stone of his life's edifice, the key-note of its harmony.

Fortunate indeed is he who, when entering earth's lists, the odds against him doubled, his own forces crippled by such an infirmity, finds himself blessed in a mother with brains as well as heart, who can curb maternal fondness and fears in accordance with a far-sighted plan for his good. To the credit of such a mother and for the encouragement of others like her who may be beginning a similar task, the writer may be permitted to state in support of the above assertions that, thanks to such a judicious training, he was able, without either memory of or aid from sight and without material assistance from any institution or corps of teachers, to compete fairly and successfully with his normal companions, not only in the different grades of the public-school and the higher branches of a normal study, but in most of the bodily exercises and sports, such as swimming, skating, running, rowing, etc.; to run bare-foot alone anywhere within ten miles of his suburban home; in short, to take an enviable part in nearly every occupation and amusement entered into by other boys; later, to travel alone over the greater part of this country and Europe, to wander through the streets of many foreign cities, enjoying their different languages and customs. Though this required, no doubt, a closer attention and a greater keenness and alertness of the faculties than the average person would have needed to exercise, it was not therefore less beneficial or pleasurable, and was certainly done with as great freedom, safety, and comfort, and as few mishaps or inconveniences as fall to the lot of an ordinary traveler. Only another proof of the old saying that there is more than one road to Rome and more than one means to an end, if one searches with a will.

The question is often asked: By what means does a person unable to see find his way from place to place, or know when to turn a corner, or even keep on the sidewalk, etc? That some such power is possessed, to a greater or less degree, by most blind people, is well

known; but just what it is or how far it may be carried, few understand; and even among those using it, to whom it is a matter of course, a simple every-day experience, few, if any, have succeeded in analyzing it satisfactorily. Though the faculty is as difficult to explain clearly to those not gifted with it as would be the perception of the difference in colors or as sight itself to the blind, I will try to give some little idea of it for the benefit of those wishing to learn for themselves or others.

It does not consist, as is sometimes fancied, in the skillful use of a cane or the exact memory of distances, though these are minor aids. It results from the union of hearing and the sense of touch, both trained to extraordinary delicacy and habituated to unusual services, coming to form a sort of *sixth sense*, as instinctive, instantaneous, and trustworthy in its activity as any of the familiar five. To illustrate: If you walk rapidly along a quiet street, listening carefully to your footsteps, you will notice that the solid buildings and walls close to the sidewalk give back a distinct echo, which instantly ceases at the openings and crossings. This to the blind is equivalent to light and shadow, and is in its crudest beginnings the first element in the "sixth sense" above mentioned. Again, if you walk slowly, in the dark, up against a wall or closed door, you will feel, just before striking it, upon the delicate nerves of the exposed portion of the face a slight sensation like that which might be produced by an infinitely fine and light gossamer veil. It is caused by the increased compression or resistance of the elastic air when forced up against one solid body by the approach of another. Repeat the experiment, and you find that the same thing is noticeable at a greater distance than at first. This is the germ of the second element already spoken of. These two perceptions, blended into one consciousness and trained to perfection by long years of practice, enable one to become aware at a considerable distance of any obstacle in his path, to determine the size and approximate shape of objects he is passing, to tell the height of a wall without touching it; in short, to take cognizance of any and all landmarks necessary in making his way or finding a given locality.

This faculty, based upon simple though generally unfamiliar natural laws, is, in some of its many forms of application, the source of most of the seemingly remarkable feats performed by sightless persons in this connection; and it is with them so habitually in use, so much a part of daily life, that its exercise is instinctive and unconscious, and the blind scarcely realize that others employ a different process to arrive at the same results. It is susceptible of almost immeasurable development. The writer has known a number besides himself who could count the shade-trees when riding at full gallop along the middle of the street, tell the difference between a close or open fence, the distance of buildings from roadways, etc. The position of corners, gateways, and the like are much more easily learned. In walking, everything is of course much nearer, and the difficulty is greatly diminished. So every change in sidewalk or fence, every inequality beneath the feet or smallest post by the wayside, is a guide, as definite and trustworthy as are buildings or signboards to him who sees.

The only things which seriously interfere with the

exercise of this faculty are a high wind, which prevents the differences in atmospheric density being perceived, and a constant monotonous noise, like the clatter of machinery or the rapid roll of wheels over a hard road, by which all echo is drowned. These make the real darkness. Hence, though many are able to ride with ease and safety, I never knew one who could drive in a carriage at all, and I do not think that will ever be feasible. I will also say that wheelbarrows, trucks, etc., left in the way by careless boys, are the blind man's bane. They make no noise, and have no voice of echo in them, nor are they high enough to give warning of their presence to any exposed portion of the skin; but humble and unpretentious though they are, they may prove a grievous cause of stumbling in the path of the peaceable pedestrian.

Save for these hindrances, which after all are no worse than being tied to a candle half of one's life, one may make sight quite easy to be dispensed with in most matters. Courage then, heartsick mother, despondent youth! The greater the odds, the more tempting the victory. Arouse ambition; strive, not to equal, but to excel what others do with better chances; at first in the little commonplaces of life, later in its more important work. What has been done can be; and what never has been done is not therefore impossible, but is rather the more worth doing.

Edward B. Perry.

Ministerial Bureaux.

IN most of the great Protestant communions in the United States much complaint is heard of a failure to utilize the ministerial forces. On the one side is a great array of vacant churches, on the other a multitude of unemployed ministers. Churches are begging for teachers, and preachers are praying for churches, and there seems to be no way of bringing the demand and the supply together. In the statistics of one religious body now before us, out of a total of 4016 churches, 941 are reported vacant; and out of a total of 3796 ministers, 1137 are "not in pastoral work." A large proportion of these last are employed as teachers, or as journalists, or in the work of benevolent societies, or in some other calling; nevertheless it is certain that several hundreds of them are available for the supply of the 941 vacant churches, if only the proper adjustments could be made. What a misfortune that so many flocks should be shepherdless, while there are so many shepherds searching for flocks!

A state of things quite similar exists in nearly all the Protestant denominations. The Methodists alone escape the reproach. It is their boast that every minister who desires to work is furnished with a field of labor, and that every church wishing a pastor is supplied. Over against the confessed disadvantages of their system, arising out of its imperfect adaptation to work in the larger cities, this great fact must be set. Some degree of freedom and flexibility may well be sacrificed to secure so perfect an economy of force. It is not likely, however, that any of the other denominations will adopt the itinerant system; it is much more likely that the Methodist church will relieve its stringency by important modifications; but it is a question often asked whether some advisory agency might not be contrived that would bring the idle ministers and

the empty pulpits into communication; and whether, in this way, the advantages of the itineracy could not be secured without suffering its drawback.

In the Protestant Episcopal church the bishop fulfills precisely this function; and it is probable that he accomplishes as much in this direction as is possible under any system which leaves to the local church unlimited power in the choice of its minister. The number of unemployed clergymen and of vacant parishes is smaller in this church than in any of the non-episcopal churches, and this is a strong reason for episcopal supervision. "A church without a bishop" has, beyond a doubt, many advantages; the liberty which it boasts is a great good; whether it more than compensates for the lack of episcopal oversight and direction is a question into which we do not propose to enter; we only wish to point out that the polity which the non-episcopal churches deliberately renounce works well in the matter now under consideration.

It has been proposed in some of the non-episcopal churches that each local ecclesiastical body—synod, or presbytery, or conference—appoint from its own members a ministerial bureau or committee of ministerial exchange, to serve as a medium of communication between ministers wanting churches and churches wanting ministers. One of the most distinguished of the Presbyterian ministers, the Rev. Dr. Crosby, of New-York, forcibly urged this plan in a lecture at the New Haven Theological Seminary. "The church," he says, "should have an organized system of bringing together unemployed ministers and vacant pulpits, by which, in a quiet way, consistent with the dignity of the church and the self-respect of ministers, churches will be able to act intelligently, without the pernicious practice of candidating. A committee should be intrusted with the delicate matter,—a committee of experienced and judicious men appointed by the chief ecclesiastical body of the district, and to this committee churches should apply, and on this committee ministers should rely."

This plan seems entirely rational and feasible; can any one suggest a serious objection to it? How great would be the gain, if the ministers who are now writing and traveling hither and thither in search of work, and the churches that are reaching out blindly after pastors, could be introduced to one another by some such judicious committee! No flaw appears in this reasoning, yet when the method is tried it does not succeed. The great Northern Presbyterian church, to which Dr. Crosby belongs, has made full experiment with it, and with discouraging results. This church would seem to possess, in its centralized organization and its admirable discipline, better facilities for the working of such a scheme than most of the other non-episcopal churches can command, yet a strenuous effort, continued through several years, to put it into operation, almost wholly failed. The presbyterial and synodical committees of supply were duly organized, and announced themselves as ready to mediate between vacant churches and idle pastors, but they have had little to do. Neither ministers nor churches resorted to them; the evil against which they were to provide is not abated; the "hungry sheep" still "look up and are not fed"; the starving shepherds still wait in the market-place because no man has hired them. The result of this experiment indicates, in the

was of a late temperate report on the subject, "that neither churches nor ministers can be brought, by any new form of machinery, to leave their concerns in other hands than their own. The committees are left out, while the parties transact their business for themselves."

The reasons of the reluctance of churches and ministers to avail themselves of such an agency does not immediately appear. Is it partly a result of an overstrained independence — an excessive jealousy of ecclesiastical control? Is it due to a fear that the committee thus organized would learn to dominate over the churches? Such an apprehension seems altogether irrational. The Episcopal churches appear to have preserved all their liberties of choice: they avail themselves constantly of the good offices of the bishop in the selection of their rectors; but it is probable that they are as free in their action as the churches of any other communion. The danger that an advisory committee, appointed by themselves year by year, would usurp authority over the churches in this matter, seems to be exceedingly remote. The fear of losing liberty sometimes degenerates into a ludicrous apprehension. "Give me liberty or give me death!" is a heroic sentiment, no doubt; but the man who prefers to die in the woods rather than surrender the liberty of finding his own way out by inquiring at the door of the wood-chopper's cabin, is a cheap variety of hero.

So far as the clergy are concerned, this unwillingness to make use of the ministerial bureau arises probably from a different cause. The larger number of these vacant churches are weak churches, and the unemployed minister hesitates to ask advice of such a committee lest they should commend him to one of these places where the labor is abundant and the support meager. To refuse such an opening would be ungracious; to accept it would imply a degree of self-denial to which he has not attained. Therefore he thinks it more prudent to keep his own counsel and conduct his own negotiations.

If such are the reasons which operate to dissuade the pastorless churches and the churchless parsons from availing themselves of this sensible provision for their mutual benefit, it is to be hoped that they may be reconsidered. A slight accession of common sense and consecration would be likely to make both parties willing to receive advice, and to agree upon some plan by which the neglected vineyards and the waiting laborers may be brought together.

In the absence of such a plan much labor of this nature falls on those who are already overworked. Home Missionary secretaries and superintendents in all the new States are necessarily burdened with such cares, on behalf of the feebleness of churches. Yet even they might be relieved to a considerable extent by the cooperation of local committees. Every pastor of a prominent church, East or West, by no consent of his own, finds himself regularly installed as a ministerial bureau.

No small share of his time is consumed in mediating between idle ministers and vacant churches. If this work could be organized and subdivided, much relief would be afforded to a few very busy men.

In some of our larger cities local bureaux of temporary supply have been established. Ministers on their vacations, and ministers without charge, resort to these bureaux; and churches of the vicinity, needing supplies for their pulpits, make application during the week and take whatever is sent them on Sunday morning. Such a bureau may be a great convenience at times; but, considered as a benevolent institution, its indirect results are questionable. The value of such an agency cannot be estimated until it is known to what extent the churches are encouraged by its presence to neglect or delay the settlement of pastors, and to rely upon a hand-to-mouth provision for their pulpits which saves them considerable money; and also to what extent restless ministers in distant towns are led to resign their pulpits and make pilgrimages to the places where the bureaux offer employment. The comparison is rude, and may seem invidious; but, if things sacred may be likened to things profane, the establishment of such an agency may be said to operate, to some extent, like the opening of a soup-kitchen; and the wisest philanthropists are now agreed that the effects of free soup-kitchens are not salutary.

Washington Gladden.

Landscape-Gardening.

TO THE EDITOR OF THE CENTURY:

Allow me to thank you for your "Landscape-Gardeners Needed for America," in your "Topics of the Time," for June.

The so-called landscape-gardener is in many cases not as intelligent as an ordinary every-day laborer; his object seems to be to have as many narrow and contorted walks as possible where they are not needed, to plant many trees and shrubs in the most inappropriate places, to make ridiculously-shaped beds, and to plant them with but one object,—to use as many plants as possible without regard to suitability. It is surely worth the attention not only of those engaged in the business, but of gentlemen who have country houses, to consider at least the fundamental features of landscape-work and landscape-art. There can be no stereotyped plans for the embellishment of grounds; each domain calls for different treatment and different grouping.

The natural surroundings should be the first consideration, instead of being, as now, often ignored. Unfortunately, we have but few good works which treat this important subject in a right manner; but, in spite of all this malpractice and ignorance, it is evident that we are progressing, though slowly.

John Thorpe,

Secretary of the New-York Horticultural Society.

BRIC-À-BRAC.

Untangling the Family Yarn.

BEING clerk of the School-Board, it was one of my duties in June to take the school-census of all under twenty-one, at the rate of three cents a head.

Having lately attended a Baptist "big meeting," I roughly estimated the babies in the district at about a thousand, not counting the other infants-in-law, who frisked and flirted, and disturbed the sleepers of the church.

On a hot July day, having tangled and untied myself over and again in the network of highways and byways of a negro settlement, I approach a cabin, the fac-simile of a hundred others.

A wooden chimney, crowned with a barrel, "larther" propped against it, and a tub of water stationed on a convenient shelf, in readiness to "squench" the frequent blaze prone to burst out with small warning, a pig-sty close at hand, the inevitable lyehopper supported by the friendly "chimbley," a row of stunted "squintch" bushes answering the purpose of a clothes-line for the family linen, and a pole tall as a flag-staff topped with an inverted bottle. This I found was a scare-hawk, companion to the scare-crow that stood in the corn-patch attired in ragged guano-bags and with a wooden musket.

There is a henhouse with a dirt roof on which green things are growing, and various semblances of out-houses and airy shelters in which confinement it would be cruelty to animals.

There is a vine patch on one side, and a bench where an old negro man, evidently "on guard" to watch and protect the melons, is comfortably snoozing. Two little dogs run out, barking and snapping like mad at my horse's heels. The doorway instantly fills with a family group ranging from the height of a jug, up to mammy herself with the shiny fat baby in arms. Only the rolling white eyeballs and the ivory teeth make a mark against the dark background.

The old man slowly rises to a sitting posture, resting his chin on the top of a crutch, and calls in the dogs.

"How 'r' y' uncle?" I say, meaning business. "Gimme names 'n' ages, 'f you please; 'min a hurry."

"Sarvant, marster; how you do yo'self, sah? I'se po'ly, thank de Lord." He stares me respectfully in the face a moment; then breaks out, "Geecraminy! Ain't dat Mars' Jack Gunsby?"

"That's my name," I growl.

"Great-day-in-de-mornin'! I'se old Unc' Buck which was head man ter Mars' Eugeems Gunsby. Thought I rickernized dat hoa'se voice ob de Gunbyzizes soon uz I heerd yer cussin' dem dogs, en I'd know dem hookèd fambly nozizes en keen black eyes like gimblet-zizes wharsomever I see 'em."

Be it understood that "zizes" is a choice form of the plural affected by Uncle Buck on occasions where great elegance of language is desired.

"Here, Betty; fetch a cheer for Mars' Jack,—dat new cheer fum upstar's, en sho yer bresh de dus' offen it. Lan' sakes! How yer is done growed! Got moustarchers; he! he!"

"Tell yer what, Mars' Jack, dem Gunbyzizes war a pow'ful fine nation o' quality. Rale top o' de pot. Many's de silber dollar I'se had flung me when yo' pa come a-gallinuppin' on his coal-black mar'. Done all his co'tin' at Mars' Eugeemziz; owned de bes' trac' o' lan' in Spotsylvania; never eben knowed all his own niggers; more'n two hundred. He meet a nigger in de road, 'Who you b'long ter, boy?'

"'Hi, marster! dunno yer own nigger?'

"Den he laff en fling a quarter. 'Go 'bout yer bizness den; yer don't 'longst in no road.' He! he!"

What could I do but laugh myself at this glorification of my ancestors, and fumble in my own limp pocket-book for a stray quarter.

"Now, Uncle Buck; the ages of your children?"

"Arter votes, Mars' Jack? Dey tells me votes dun riz ter two dollar en thutty cent."

"No; I'm after those who can't vote. How many in your family under twenty-one?"

"Well, less see; I b'lieve dars some sebenteen ur twenty. Dars nine ars; want de gals too?"

"Want all."

"Dars Ham, Sham, en Jacob in comp'iment ter Norah en de Ark; den I 'menced on de 'postles,—Mat, Mark, Jake, en John, Betsann en Vilet. Lord Vorrint, he drawed up wid ager en got throwed back; en dars Wise en Foolish is 'bout de bes' leetle yoke o' steers, en Gundy en de bell-cow —"

"Stop! stop! Leave out the cattle; I'm only after folks this time."

"Prezackly, Mars' Jack; thought yer wanted de whole fambly, sah. Den yer'll have ter scuze Jake en John, caze dem's de two leetle coon dogs; t'oth'rs is all human cre'tur's; I leetermody forgot Peter."

"Give me Peter's age."

"Peter?"

"Yes, Peter."

"Peter mighty nigh old uz I is. He born in old slave times."

"Then Peter is over twenty-one?"

"Oh, yes, sah; Peter was Tildy's ar. I b'en had fo' wimmen-folks, en all on em's got der diffunt batches o' ars en gals likewise."

"Uncle Buck, call up your flock, and I'll count heads."

But with great dignity Betty was ordered to "fetch the fambly Bible." It proved to be a battered copy of "Bacon's Abridgment"; and after examining the hieroglyphics on the fly-leaves, I preferred the unwritten page of nature.

"Come here, boy," I said sternly to a grinning conglomeration of eyeballs and wooliness, dressed in a single tattered garment. "What's your name?"

"Binjy, sah."

I wrote down "Binjy." "Age?"

"D'n'o', sah!"

This produced an outcry from Betty.

"Dunno yer own age, Binjy? En yer be'n ter school two *whole endurin' sections*! Yer ain't wuthy ter have a' age."

Binjy hung his head and put part of his hand in his mouth.

"Let me see your teeth, boy. There! that's wide enough; I'm not going inside. Let me see: four missing, three sagged. You are half past nine!"

"Pa' Gard, dat's so! Nuver knowed yer could calker-are de aiges o' cre'tur's by der teeth; scuzin' 'twere no manner. Now run home, en tell yer mammy yer aige 'til yer forget it, Binjy."

"Isn't he your child?"

"I an' 'ol Moses, Mars' Jack! I 'lar' ter gracious, dat nigger 'longst ter Vianna back dar in de cle'rin', en dat nigger chile knowed it, when he gint you dem generations."

"Oh, well," I say hastily, erasing the "generations" of Binjy so heedlessly jotted down, "let us begin again. Give me the age of Shem."

"Shem, Mars' Jack?"

"Yes, Shem."

"I do remember how old Shem are. I speck Shem 'bout forty year' old."

"Confound Sham! Give me Ham."

"Ham, Mars' Jack?"

"Yes, Ham's age."

"Betty, how old you speck Ham are? I reckon Ham 'bout forty year' old."

"The deuce he is! I tell you, old man, I only want those under twenty-one."

"Den I speck yer don't want Jacob's aige nother, caze dem three ars is twins."

With a sigh of resignation, I at last extract seventeen names from the parents, "all humans," Betty assures me, with their literary attainments pretty generally represented by zero, as Uncle Buck's notion of education was "a little figgerin' to keep folks fum a-cheatin' on 'em," and that "book larnin' sp'iled a fiel'-han' entirely. One little gal could write, but not read."

"How is that, Uncle Buck?"

"Dunno, Mars' Jack; but dar 'tis. De paper is all wroten ober wid marks, en dat what I say; nobody

is got sense nuff ter read little Betsann's writin', no more 'an she can't read it her own self."

When I inquire after "Mozizes" attainments, I am informed, "He dade, sah," and four other "ars" are also cast out as born in slave-times.

Poky proved to be a "boarder." "En a mons'ous troublesome member o' de fambly, Mars' Jack, seein' she's a' idgit. Her mammy wuks out by de day, en Betty 'lowed she'd make a sight o' cash money by takin' bo'ders. De chile's mammy counted on she was gwine ter pay a fo'th o' de sumac crap for de year's bode; but Betty, she mighty sharp on a bargain, en Betty 'low de crap mought not fetch a fo'th, en stiflicated in de bargain how she would charge forty cent a mont'. Den Vianna, she bought a mighty strong barrel o' fish fur fifty cent, en when pay-day come, 'tis a bucket o' fish, whar I en Betty jest could eat to keep fum wastin' vittles, en a bag o' sumac *here*, en a peck o' taters *dar*, en some long-handle, godes, en seed butter beans, en one ten-cent piece, en Betty so confused in her min' she can't tell wher she make ur loss by de business. Vianna gwine ter try ter run in a row o' cabbages en some injuns on Betty next mont'; but Betty done 'clar' fo' Gord, she ain't gwine ter 'cept o' no mo' fish ner garden projuce scuzin' 'tis meat ur money.

"Dis speckerlation o' Betty's 'minds me o' gwine huntin' in old slave times wid de oberseer's son, dat bow-la'ged Sampson. He say, we was gwine in cahoots. I furnish' my yaller coon dog, en he furnish' de gun; en de dog treed de coon, en dat Sampson he shoot him, en went off wid de game, en I come long back home wid de cahoots."

"Now, just give me your occupation, Uncle Buck, and then the direction to the nearest neighbor—the shortest way."

"My perfession, Mars' Jack, am fustly, deacon o' de church; thirdly, millerin'; nextly, a hoe hand."

"Millering? What mill do you run?"

"I be'n runnin' de cider-mill for dem Biggerzizes nigh 'on three year next July, Mars' Jack. 'Spected yer knowed dem Biggerzizes, Mars' Jack; dey is rale quality."

"Certainly, all right; now for the next house, and the nearest way."

"Yer mus' go down de lane tell yer come acrost some drubbares, but don't go thu no bares, en gullong tell yer come ter de paff; but dat paff is old Kizzizes spring paff; en a right smart while 'fo' yer git ter a mons'ous big mud puddle, yer mus' turn ter delef'-han' paff en den ——"

"How?"

"Well, yer see dat poplar-tree down de road whar de lightnin' strek?"

"Yes."

"Well, yer mustn't go nigh dat tree; dar's a little paff to de cuppin, too, whar yer mustn't take, en dat windin' paff down de hill is de spring paff, en yer gwine come to Jim Crow's medder bares, en yer must jes' keep long de paff tell ——"

"Which path must I take? I don't understand."

"Good Lordy mussy! Mars' Jack, I see I can't learn yer no sense. So Betty better jest gullong en show yer de way, sence I kin no better do."

In the Café.

WHAT! Galopin is dead, you say?
Why, he was with us yesterday;
His face was like a rose in bloom;
His laugh the lightest in the room;
His wit — Poor Galopin! *Ah, oui!*
C'était, mon cher, un bel esprit!

And now, to-night, you say he lies,
The seals of death upon his eyes,
His lips for evermore at rest,
The crucifix upon his breast.
Poor Galopin! *Quelle farce pour lui,*
Plus gros farceur de tout Paris!

He hurried off; it was, you know,
His night upon the "Figaro";
See! Through the print his spirit shines!
Ah, when the angels read these lines,
The talk of all the town he'll be,
If there's a town *au Paradis*.

You saw the chamber in its dress
Of lilies and of lilacs, — yes,
The tapers, lace — I know their ways —
The carnival at Père-la-Chaise!
For all the earth I would not see
That earth in their *diablerie!*

Work made and killed him. Even so,
He goes as it were best to go.
The dead ride fast. *Ami*, fill up!
A Galopin! The stirrup-cup!
And now to work! *Ah, cher*, if he
Had mourned for us — he had *esprit!*

T. R. Sullivan.

The Hundredth Man.

THE May-day brought the welcome monthly guest,
Its pages breathing song and scent of flowers;
What fairy-land e'er granted such a quest, —
A century of joy in three short hours!

I read with pleasure constantly increased,
The prose, the verse, old Egypt's buried past,
But as the rarest viands crown the feast,
Kept Stockton's charming story till the last.

And when I'd read it through, to reverie
I gave myself (you've doubtless done the same),
And wondered what the outcome was to be,
And what the (thus far) hidden hero's name.

For study all who've stepped upon the scene,
Their characters, thoughts, habits closely scan,
You'll find it very difficult, I ween,
To choose there your ideal hundreth man.

But it may be that, shunning prying eyes,
Within the green-room of the author's brain
The hero lurks, and all attempt defies
Of those who would his mystery profane.

Yet I'm no prophet, and presume in naught
To penetrate the gifted Stockton's plan,
But I confess I'm haunted by this thought, —
What if a woman be the hundredth man?

THOMAS JEFFERSON'S HOME.

SCENE IN WHICH THE DECLARATION OF INDEPENDENCE WAS WRITTEN.
PAINTING BY THOMAS JEFFERSON.

OF the many American multitudes who assembled on the Centennial Fourth of July to hear the reading of the Declaration of Independence, every individual knew that it was written by Thomas Jefferson. Scarcely one in a million, however, was aware that that occasion was also very near the centennial anniversary of his first occupation of his once famous homestead of Monticello. While the date and the authorship of the Declaration have become fixed stars in historical fame, in one hundred years after the signing, and in fifty years after the death of the illustrious author, the popular knowledge concerning Jefferson's place of birth and Jefferson's home had shrunk to the dimensions and substance of a dim tradition. To a brief attempt at reviving that tradition, the following pages are devoted.

Peter Jefferson, the father of the author of our Declaration, married into the Dungeness branch of the Randolph family, and he and young William Randolph of Tuckahoe, in the year 1735, feeling that they had their fortunes to make, concluded to "go West"; that is, they left the old tide-water settlements on the James River, and went to join two or three other pioneers as first settlers in the country now forming the county of Albemarle, Virginia. It would not be considered much of a "move" in our day, as it was less than a hundred miles of a bee-line, and took them only to the first outlying chain of the Allegha-

nies, known at that point as the South-west Mountains, some twenty odd miles eastward of the Blue Ridge. Nevertheless, they found here a comparative wilderness, and what was essential, plenty of unoccupied land. Of this circumstance they took immediate advantage; their natural highway had led them up the Rivanna, an affluent of the James River flowing from the North-west; and probably hesitating to put the barrier of even a low mountain chain permanently between themselves and the old settlements, they determined to locate on the eastern slope of this chain. Young Randolph "patented" a tract of 2400 acres lying on the Rivanna; and young Peter Jefferson, a few days later, like him "patented" a tract of about 1000 acres, lying just west of his friend's. Both tradition and documents record that when Peter Jefferson came to examine his new estate he failed to find a situation to his liking whereon to build his cabin, which should, according to his hopes and the fashion of the period, in due time grow into a manorial hall of baronial amplitude and aspect. He mentioned his difficulty to his friend Randolph, who furnished a ready expedient to cure it. Land being abundant, building sites ought not to be scarce; so reasoning, he quickly supplied the want by giving Peter a deed to four hundred acres of his own tract, the purchase-money, or consideration, being "Henry Weatherbourne's biggest bowl of arrack punch."

This additional four-hundred-acre tract seems to have furnished the coveted building lot; though, looking at the landscape from an elevation, the spot finally chosen has nothing specially to recommend it over a dozen other points of ridges which run down toward the river. On one of these points he built a story-and-a-half weather-boarded house, with central hall, four square rooms, garret chambers

above them, and huge outside chimneys at each end. As the custom of that day required that every ambitious homestead should have a distinctive name, Peter Jefferson christened his estate "Shadwell," after Shadwell street, London, where his wife's mother was born. On this place and in this house was born, one of a family of eight children, Thomas Jefferson, author of the Declaration of Independence, and third President of the United States. Here he lived as a child, boy, and man, with but temporary interruptions, twenty-seven years. When he left it, it was to move to Monticello, the home of his own special choice, preparation, and care, within an evening stroll of his birthplace, where, with occasional absence, for more than half a century, as congressman, author, governor, diplomat, cabinet minister, politician, Vice-President, President, philosopher, and octogenarian, he found his highest delight in that most engrossing of human occupations, the ever-beginning and never-ending task of creating an ideal home.

For a boy born in a wilderness, Jefferson enjoyed remarkable advantages in early youth, growing out of the fact that the frontier was as yet so near the parent colony. Good English tuition at five, Latin, Greek, and French at nine, regular classical studies at fourteen, and a college course at seventeen, fall to the lot of few American backwoods boys. Trap-

ping quails and shooting wild turkeys, deer-stalking, fox-hunting, and horse-racing, do not figure to any extent as his biographical exploits. Jefferson the boy is a book-worm — Jefferson the youth is the petted member of an exclusive coterie, social, aristocratic, and literary. The accomplishments and courtly habits of the town efface all the strong characteristics of the country lad, or rather, soften them down and leave them but two in number,— the keen zest of horsemanship and a true love of nature — the pure and passionate admiration of plant and blossom, of rock and stream, of fresh air and blue sky. These are the legacy of the forest; all else he learns from books and the social traditions which drift from the Old World to the New. Yet such is the strength of Nature's influences that by these two slender threads she held this nursling of society and made him the apostle and bulwark of that primitive equality he abandoned, against the pretensions and claims of caste and privilege to the favors of which he largely owed the development, if not the awakening, of his genius.

But if Jefferson enjoyed early advantages he was also burdened with early cares. The death of his father, when he was but fourteen, left him head of the family. Out of the practical needs of the home at Shadwell probably grew the dream, no less than the actual real-

MONTICELLO, THE EAST PORTICO.

MONTICELLO, FROM THE RIVANNA RIVER.

tion, of the future home on Monticello. It is of course impossible to guess how and where his plans began ; we only know that their gradual development covered a period of some seventeen years, and note the circumstances which rendered their accomplishment possible.

At his father's death Jefferson inherited the home farm of Shadwell, and so much of the other farms and lands originally patented by Peter Jefferson,—and now respectively named "Monticello, Lufton, Pantops, Pouncey's," etc.,—as amounted in the aggregate to about nineteen hundred acres. He also inherited about thirty slaves, as a working force to till such portion of these lands as were under cultivation. Aristocratic families and manorial estates were the fashion and the pride of the Virginia gentry. But, fashion aside, the care of the family, the lands, and especially the slaves, of itself necessarily required some considerable "homestead" establishment. The old, square, weather-boarded house at Shadwell, though quite sufficient for Peter Jefferson and his bride of nineteen, with perhaps a neighborhood of a dozen settlers, was probably deemed both too small and too antiquated for a large family, comprising marriageable sons

and daughters, among a greatly increased population of neighbors.

Shadwell stood on a hill or point rising from the north bank of the Rivanna. Some two miles beyond the stream to the south-west lay the "Little Mountain," Italianized by Jefferson into "Monticello," with probably his earliest studies in that language. Seeing this Little Mountain so constantly the chief object in the homestead landscape, it is no wonder that it became to him successively, first the boy's wonderland of exploration, then the youth's haunt of recreation and study, and lastly the inviting and propitious locality of early manhood's domestic ambitions. It must be remembered of Jefferson, that though he stood six feet two inches high, and possessed a strong physical vitality, yet he was cast in the feminine rather than in the masculine mold. Instead of the athletic sports of hunting and horse-racing, the harsh excitement of cards and personal broils, he shrank away to the more solitary and quiet pursuits of books and music, the writing of rhymes and dancing with village belles. The poetic and artistic temperament dominated not only his youth, but his entire life.

MONTICELLO, WEST FRONT.

He seems from the beginning to have appropriated the Little Mountain to himself for his own uses. Probably this feeling of personal ownership came to him even in boyhood, as by right of discovery and exploration. Tradition makes it the scene of his first and closest friendship. He and his college friend, afterwards his brother-in-law, Dabney Carr, found here a favorite oak, whose inviting shade they made a resort for pastime and study. They finally became so attached to this spot that they made a mutual promise, the survivor should bury the other at the foot of this tree; and upon Dabney Carr's early death Jefferson fulfilled the romantic pledge. This incident is said to have originated the little cemetery on the slope of Monticello, where the dust of Thomas Jefferson now lies in its last repose.

Jefferson's biographies give no concise information when the idea of planting a homestead on the Little Mountain first took definite form or entered upon practical execution. In his earliest published letter, written at seventeen to his guardian, he gives as a reason in favor of going to college: "In the first place as long as I stay at the Mountain, the loss of one-fourth of my Time is inevitable, by Company's coming here and detaining me from School.

And likewise my Absence will in a measure put a Stop to so much Company, and by that means lessen the Expenses of the Estate in House-keeping." At this date Shadwell was still the homestead; and whether by the phrase "the Mountain" he referred to Monticello or to the range of which it formed a part is not clear. To college he went, for the period of two years, and after college to a course of five years' law study, making together a seven years' sojourn at Williamsburg, the colonial capital and metropolis. But during these seven years he habitually spent his vacations — the summer months — at Shadwell. That he gave near the close of this period his individual attention to the minutest details of domestic management is evidenced by his beginning in 1766, his twenty-third year, to keep a garden-book, which with unavoidable interruptions was continued by him until within two years of his death, a total record of *fifty-eight years*, stored, among other things, with farming and gardening memoranda,—an overwhelming proof of his extraordinary interest in and devotion to his "home" life. During this college period he had his first love affair — his unsuccessful courtship of Rebecca Burwell — an experience which, judging from his letters,

stirred his sympathetic nature to its profoundest depths. What airy shapes and radiant possibilities his "Spanish Castle" on Monticello may have assumed during the pendency of this grand question, may well be left to the imagination of any aspiring, sentimental wooer. His biographer mentions, too, that during these vacations a gallop on horseback during the day and a twilight walk to the top of Monticello at evening were the habitual recreations with which he relieved the constraint of his twelve to fifteen hours of daily study.

It must have been about the time of his entering upon the serious work of his life, the beginning of his actual law practice in 1767, at twenty-four years of age, that he also began the serious task of preparing his Little Mountain for his future homestead. His proper period of expansion, ideally and practically, had now come. More than all, the expenses of the college and law student were ended, and his labors as a practitioner began to bring an available compensation. Shadwell was but a little hill or ridge on the north bank of the River Rivanna: Monticello was in reality as well as in name a little mountain, nearly six hundred feet high, lying just south of the Rivanna, which at this point (near Charlottesville, Albemarle County, Virginia) cuts its channel through the outlying range of the Alleghanies known as the South-west Mountains. On the north-east, Monticello has a steep rocky base, washed by the Rivanna; on the south-west it is joined, by a gap of perhaps two-thirds its height, to Carter's Mountain, a somewhat higher and sharper peak; on the other sides the ascent is more gradual. It is yet covered, in the main, by a dense growth of timber, mainly of hard-wood deciduous trees. The top of the mountain is gently rounded, appearing at a little distance as regular as the large end of an egg. It is more than probable that the spare hands among Jefferson's thirty slaves employed the leisure days of several years, first in clearing a road to the summit; secondly in making the summit perfectly level; and lastly in preparing the place and the foundations for the buildings, and as an essential prerequisite, in digging a well, which still, except in times of drought, furnishes good water in abundance.

The "garden-book" already mentioned furnishes the record that in the spring of the year 1769 he caused a

variety of fruit trees to be planted on the south-east slope of the mountain. This was not on the level or building spot; and the necessary clearing must have been made before that year. "Towards fall," says his biographer, "he erected a brick story-and-a-half building containing one good-sized single room—the same structure which now forms the south-eastern 'pavilion' at the extremity of the south terrace of the mansion." Elsewhere we find that this story-and-a-half brick "pavilion" was twenty feet square in size.

An untoward accident hastened the work on the new homestead. On the first day of February, 1770, the family house at Shadwell was burned. Nearly all its contents were also destroyed, the principal loss in Jefferson's eyes being his papers and books, which latter he estimated at \$1000 cost value. Not only his law books, but his records and notes of cases he had prepared for court, everything in the shape of written memoranda, except the "garden-book," the preservation of which was long unknown, went up in flame. The servant who brought him the news in breathless haste had but one consoling item of information—"they had saved his fiddle." And here at this point of time we find the only moment of wavering in his affection for his Little Mountain. He says in a letter to his friend Page: "If this conflagration, by which I am burned out of a home, had come before I had advanced so far in preparing another, I do not know but I might have cherished some treasonable thoughts of leaving these my native hills."

However unpromising Monticello may have seemed about this time, its further improvement was probably crowded with all possible speed, and not without an object. A second courtship was crowned with success; and on the first day of January, 1772, Jefferson was

THE TOMB OF THOMAS JEFFERSON.

married to a beautiful, accomplished, and wealthy widow, Mrs. Martha Skelton. One of the curious incidents in the life of this curious man was the termination of the bridal tour,—a winter trip of a hundred miles through the snow, over country roads, ending in a horseback ride up the steep mountain side of Monticello, their arrival at the single-roomed story-and-a-half brick pavilion, the only part of the house yet finished, late at night, tired, cold, and hungry, to find the fires all out, and family and servants locked in profound sleep. A chance half-bottle of wine found behind some books on a shelf was the only good cheer at hand to add to their own overflowing gayety and happiness.

There was pressing need now that the new

home should grow and improve; but the new need also brought new resources. The bride's inheritance, a year later, doubled the family possessions. Of prime importance was the fact, that as the number of slaves was now nearly two hundred the homestead might draw an ample supply of laborers. It is estimated that during this period of his life Jefferson's income amounted altogether to about \$5000 per annum—\$2000 from his farms and the labor of his slaves, and \$3000 from his law practice, so that the wherewith for prosecuting his manorial schemes on his Little Mountain probably for the time seemed ample and secure. It is perhaps not to be wondered at that under all these stimulating influences, his projects should become somewhat too elaborate and visionary. Some fragmentary notes published by his biographer show that he meditated a small cemetery, with wall, evergreens, antique gothic temple, pedestals with urns, pyramid of rough rock-stone; the spring on the north side of the park to be embellished by a cascade, a temple, or a grotto, with a statue, inscriptions, a concealed æolian harp, moss couch, and other devices. For the general grounds, ornamental trees, vines, and flowers, with ornamental domestic animals, no less than a preserve or, rather, an asylum for wild animals—with a buck-elk or a buffalo to be "monarch of the wood." Very practical is his list of native shrubs, trees, and flowers, designed to ornament the lawn and immediate surroundings of the house. It did not require much time or experience to bring even an enthusiastic innovator like Jefferson to simple and economical theories. "Gardens are peculiarly worth the attention of an American," he writes afterwards, "because it is the country of all others where the noblest gardens may be made without expense. We have only to cut out the superabundant plants."

Whatever his theories of the beautiful may have been at that time, he did not permit them to usurp and exclude the useful. The published pages from his "garden book" for 1772 and 1774 would satisfy the most rigid market gardener. They include also many items of fruit trees and grapes, not neglecting some native vines transplanted for experiment from the woods of Monticello itself. An ill wind, too, had just now blown him good luck. An organized effort to introduce extensive wine culture, undertaken by some Italian gardeners for a Virginia company of which Jefferson was a member, had failed and been abandoned, and he was now able to obtain the skilled labor of these Italians for the improvement of Monticello. Under their management, as the "garden book" shows, seeds

THE MAIN STAIRWAY.

MONTICELLO, THE HALL.

not only went into the ground, but, what was more to the point, vegetables came to the table. All this shows that the work of preparing, building, and finishing the Little Mountain homestead was going on with vigor at this time, though its progress in detail cannot be traced. The stormy days of the Revolution here intervene, and we see only that memorable picture of the signing of the Declaration of Independence, and hear the solemn peals of the old bell "Proclaim liberty throughout all the land."

It is not until the labor and care of twelve years had brought it to its first period of completion that we obtain a short description of Monticello. Mr. Jefferson first moved there in 1770. In 1782 the Marquis de Chastellux paid Jefferson a visit, and in his book of travels thus mentions the home of his distinguished host:

"After ascending by a tolerably commodious road for more than half an hour, we arrived at Monticello. The house, of which Mr. Jefferson was the architect, and often one of the workmen, is rather elegant, and in the French taste, though not without fault: it consists of one large square pavilion, the entrance of which is by two porticoes ornamented with pillars. The ground-floor consists of a very lofty saloon, which is to be decorated entirely in the antique style; above it is a library of the same form; two small wings, with only a

ground-floor and attic story, are joined to this pavilion, and communicate with the kitchen, offices, etc., which will form a kind of basement story over which runs a terrace. . . . We may safely aver that Mr. Jefferson is the first American who has consulted the fine arts to know how he should shelter himself from the weather."

Then the delighted marquis goes off into an enthusiastic description of his host, his remarkable political career, and his amiable family, giving us also the results of Jefferson's project of an animal park:

"Mr. Jefferson amused himself by raising a score of these animals (deer) in his park; they are become very familiar, which happens to all the animals of America; for they are in general much easier to tame than those of Europe. He amuses himself by feeding them with Indian corn, of which they are very fond, and which they eat out of his hand."

But Monticello was now for a long period deprived of the fostering care of its master. A heavy affliction fell upon him in the death of his wife; and being for the third time tendered an appointment to Europe by Congress, he accepted it. Various delays prevented his sailing until 1784, when he left the homestead to the charge of overseers and servants. Five years later, on the 23d of December, 1789, these servants enjoyed a great gala-day,

following a carriage in a sort of triumphal procession from Shadwell up the mountain road to the top of Monticello, almost bearing the owner in their arms into the dear old home, and looking with admiring wonder upon the two tall young ladies, one of seventeen and one of eleven, who had gone away mere children and playmates.

Jefferson's note-book of his European travels was full of observations, suggestions, and diagrams, doubtless intended for use on the homestead on his return. Their practical application was, however, destined to be yet deferred for some years. Hardly had he landed on his return from France, when he was met by President Washington's letter summoning him into the first cabinet under the Constitution, as Secretary of State. This public employment kept him away from home so much of his time that no essential improvements or changes were begun until after his resignation in January, 1794.

Once more, now, bent on retirement from public life, Jefferson took up his broken and unfinished task of spinning his ideal web of a home life of tranquil happiness. From the pen of another visitor, the French exile Duc de la Rochefoucauld-Liancourt, we have a graphic pen-picture of the Monticello of the second period, June, 1796:

"The house stands on the summit of the mountain, and the taste and arts of Europe have been consulted in the formation of its plan. Mr. Jefferson had commenced its construction before the American revolution; since that epocha his life has been constantly engaged in public affairs, and he has not been able to complete the execution of the whole extent of the project which it seems he had at first conceived. That part of the building which was finished, has suffered from the suspension of the work, and Mr. Jefferson, who two years since resumed the habits and leisure

of private life, is now employed in repairing the damage occasioned by this interruption, and still more by his absence; he continues his original plan, and even improves on it by giving to his buildings more elevation and extent. He intends that they shall consist only of one story crowned with balustrades; and a dome is to be constructed in the center of the structure. The apartments will be large and convenient; the decoration both outside and inside simple, yet regular and elegant. Monticello, according to its first plan, was infinitely superior to all other houses in America in point of taste and convenience; but at that time Mr. Jefferson had studied taste and the fine arts in books only. His travels in Europe have supplied him with models; he has appropriated them to his design; and his new plan, the execution of which is already much advanced, will be accomplished before the end of next year, and then his home will certainly deserve to be ranked with the most pleasant mansions in France and England.

"Mr. Jefferson's house commands one of the most extensive prospects you can meet with. On the east side, the front of the building, the eye is not checked by any object, since the mountain on which the house is seated commands all the neighboring heights. On the right and left the eye commands the extensive valley that separates the Green, South, and West mountains from the Blue Ridge, and has no other bounds but these high mountains of which on a clear day you discern the chain on the right upwards of a hundred miles, far beyond the James River; and on the left as far as Maryland on the other side of the Potomac. . . . On this mountain and in the surrounding valleys on both banks of the Rivanna, are situated five thousand acres of land which Mr. Jefferson possesses in this part of Virginia. Eleven hundred and twenty only are cultivated. The land, left to the care of the stewards, has suffered as well as the buildings from the long absence of the master; according to the custom of the country it has been exhausted by successive culture. . . . At present he is employed with activity and perseverance in the management of his farms and buildings; and he orders, directs, and pursues in the minutest details every branch of business relative to them. I found him in the midst of the harvest from which the scorching heat of the sun does not prevent his attendance. His negroes are nourished, clothed, and treated as well as white servants could be. As he cannot expect any assistance from the two small neigh-

boring towns every article is made on his farm; his negroes are cabinet-makers, carpenters, masons, bricklayers, smiths, etc. The children he employs in a nail factory, which yields already a considerable profit."

We have thus seen how Monticello gradually grew up, following perhaps a general and undefined project from the beginning, and yet modified from time to time by the increased means, knowledge, experience, taste, and observation of its founder. It was a simple story-and-a-half brick house when he brought his bride to it that dreary winter's night in 1772. Since then he had been congress-

MONTICELLO, FIREPLACE AND DUMB-WAITER.

MONTICELLO, THE BALL-ROOM IN THE DOME.

man, governor, minister plenipotentiary, and Secretary of State, had traveled at home and abroad, had reared his children, and was now confronted with the care and protection of the second generation. In the interim Monticello had become, first a plain Italian villa with a library on the second floor, and now again with a new transformation, a network of buildings dominated by a spreading country mansion of twenty rooms, with two Greek porticoes, and an octagonal dome, with very solid brick walls, strong frame-work, good floors, a great profusion of elaborate trimmings, and full of the quaint and strongly original devices and inventions of his own. Designed by no architect, unless he could be called one, no order or style could exclusively claim it, nor is it probable that any architect of that or our day would willingly make it a model, in either general design or curious details. But to Jefferson it must have been not only a castle, stronghold, refuge, but a very temple of art; in short, his own peculiar world, in a certain sense created by and for himself. He considered himself now once more master of his time and his inclinations, the owner of five

thousand acres of land and one hundred and fifty slaves. He was already over fifty years old, a principal figure in the history of his epoch, the cherished member of a wide circle of friends, the authoritative head and center of a numerous family group. Above all, Monticello had been triply sanctified by the domestic events of birth, death, and marriage. If he had given the tender and constant solicitude of a quarter of a century to this dream of an ideal home, it must have seemed to be on the point of practical realization as nearly as human hopes ever reach fruition.

Some such feelings doubtless prompted a vigorous administration of his estates and urgent efforts for the final completion of his house during the two years from 1794 to 1796. Once more drawn, however, into the resistless and swelling stream of national politics, he became Vice-President of the United States from 1797 to 1801, and finally President from 1801 to 1809.

No doubt delighted by this final and crowning mark of his country's esteem, it must nevertheless have cost him a pang to find once more his busy personal work of household

improvement broken in upon by absorbing and vexatious public duties. But there was some relief in the fact that the seat of government had in 1800 been brought much nearer to his home by the transfer of the capital to Washington. Either in his carriage, his one-horse "chair," or in the saddle, he could

JEFFERSON'S CHAIR AND WRITING-TABLE.

make the journey to or from Monticello in three days. As compared with former periods of absence, this was almost like living at home. With similar facility he could send seeds, cuttings, or plants, or transmit personal directions to the family or his overseers. He now adopted the habit of making each year one or two prolonged visits to Monticello, and these coming in the spring and fall,—the farmer's working seasons,—the homestead may, notwithstanding his general absence, be said to have been practically under its master's supervision.

Had he now been content to pursue merely the completion of his plans and work, he would probably have fared better in the end. But in this situation, instead of curtailing them, Jefferson seems rather to have extended and multiplied the labors and business of his homestead and estates. The published reminiscences of his overseer state that it was now that he improved the terraced garden on the side of the mountain some two acres in area. There was a small grist-mill on the Rivanna, but the neighborhood became ambitious and wanted a larger one. In the eyes of the country people, a President of the United States, receiving a salary of \$25,000, was a Croesus and Aladdin combined. Jefferson, with his fondness for mechanical improvement and his proclivity for economical enterprise, did not

in all probability need much persuasion. He built the mill, a large four-story building, with four runs of stones, at a heavy expense. It was a point of great pride with him that he had always been, and would always remain, a farmer. His connection with a company for wine culture has already been mentioned. He had at various times introduced into the country such new seeds and plants as he thought of great prospective value,—upland rice, olive-trees, the cork oak, etc., etc. He now imported merino sheep and other domestic animals. He not only invented a new form of mold-board, making a great improvement in the then commonly used plow, but led the way in the employment of other improved farming implements, notably a seed-drill and a threshing machine.

At the beginning of the Revolution, many patriots in Virginia and others of the American States had determined to abstain resolutely from the importation, purchase, and use of British goods and manufactures, and to practice and foster home production. The seven-years war continued as a necessity what was begun as a virtue. Amid these and succeeding events, the intelligence and mechanical and inventive genius of Jefferson himself made his homestead and estates probably more than ordinarily self-dependent. It was in this way that he gathered about himself, among his slaves and servants, the skilled laborers, out of whose combined

SOME OF THE OLD SILVER.

JEFFERSON'S BED ROOM.

handiwork rose the fair structure of Monticello. It almost grew out of the soil. From the bricks which yet compose its walls, to the nails which yet unite its wood-work, including much of its furniture, and even that characteristic appendage of the period, the state carriage, Monticello was in its essential components an honest and genuine article of home manufacture. Not alone for the master and master's family; for to this combination and coöperation of farm and forge, of manor and mill, of architect and artisan, of land-owner and land-tiller, between one and two hundred human beings looked with right and reliance for daily work and daily bread, during at least two generations.

After having served the eight years of his presidential office, Jefferson retired to this his chosen refuge, the creation of his own thought and industry, of much of his own personal handiwork, and spent yet seventeen long years in what with wise forethought and manly persistence he had indeed made "the dearest spot on earth." Under his own vine

and fig tree, in his own house and his own garden, sitting in the refreshing shade of the trees he had himself planted, plucking the flowers and fruits he had himself reared, he talked wisdom to his gray-headed neighbors and contemporaries, gave kindly instruction and admonition to inquiring youths and students, or led his joyous and romping grandchildren through their juvenile games. American annals can present few pictures of so long enjoyed and so perfect a fruition of a labor of love.

Bright and alluring as it is, the picture also presents painful shadows. He plucked his own domestic roses with bleeding fingers. The wounds of a bitter partisan conflict galled him; the persecutions of visitors and letter-writers worried him; and at last a hopeless bankruptcy brought him to the humiliating knowledge that the bread he ate was no longer that of his own earning.

Driven to extremities by the necessity of paying a security-debt of \$20,000 which he had indorsed, he applied to the legislature of Virginia in the last year of his life, to be allowed to dispose of his property by lottery. "If it is permitted in my case," he writes, "my lands here alone, with the mills, etc., will pay everything, and will leave me Monticello and a farm free. If refused, I must sell everything here, perhaps considerably in Bedford, move thither with my family, where I have not even a log hut to put my head into." The privilege asked was finally granted, but so tardily that it wrung from him, like a groan of anguish, the sentence, "I count on nothing now. I am taught to know my standard."

As so often happens, the lottery scheme failed through popular apathy. But the public sympathy was to some extent aroused, and citizens of New York, of Philadelphia, and of Baltimore sent him contributions amounting in the aggregate to \$16,500. This relief, though inadequate, was yet sufficient to justify his belief that Monticello would be saved to his daughter. In this hope he died July 4th, 1826, having occupied Monticello as a home just six years more than half a century and was buried in the little graveyard he had planned nearly three-quarters of a century before.

J. G. Nicolay.

FRIEZE IN DRAWING ROOM

THE LATER YEARS OF MONTICELLO.

DURING the summers of five or six years, my favorite study, when the days were fine ones, has been under the shade of some large trees, from which, across the valley of the Rivanna River, and distant about a mile as a wild bee would fly, I have had a beautiful view of the rounded slopes of Monticello surmounted by the great trees which still stand around the old home of the man who formulated for us our national idea. There is something in the air of the country hereabouts which continually suggests Thomas

into this country, and which still keeps his memory a dark, luxuriant green.

It was easy for me, with this famous mansion ever before me, and in this Jeffersonian atmosphere, where there is so much to see and so much to hear of Monticello and its belongings, to bring before my mind the home of Jefferson as it stood at the time of his death.

We have seen how Monticello gradually grew to be a spacious and imposing mansion, but I think it is not generally known with what pleasure and zeal Jefferson brought his mind to bear, not only upon the development of his somewhat grand ideas in regard to a home, but upon the most minute and peculiar

THE UNIVERSITY OF VIRGINIA AT CHARLOTTESVILLE. (DESIGNED BY JEFFERSON.)

Jefferson. The fields and woods around me once formed one of his plantations; the friends with whom I staid are his descendants; I took my evening smoke in an arm-chair—Paris-made, with little brass ornaments on the arms—which once belonged to him; and this paper was written on a small table with four curious wings, which can be spread out at the sides to hold books of reference, that was used by Mr. Jefferson as a writing-stand, and on which yet remain some blots of ink which declared their independence of his pen. Many of the neighboring estates still bear the names he gave them, some Latin and some Greek, such as “Lego” and Pan Optimus—the latter now corrupted to Pantops; and here and there on the sides of the hills grows the Scotch broom which he introduced

contrivances for convenience and adornment. He drew plans and made estimates for nearly everything that was built or constructed on his place. He calculated the number of bricks to be used in every part of his buildings; and his family now possess elaborately drawn plans of such bits of household furnishing as “curtain valences” and the like. Many of his ideas in regard to building and furnishing he brought with him from France; but more of them had their origin in his brain. There were no bedsteads in his house, but in every chamber there was an alcove in the wall in which a wooden framework was built which supported the bed. His own sleeping-arrangements during the lifetime of his wife were of a very peculiar nature; in the partition between two chambers was an archway, and in this

IN THE UNIVERSITY GROUNDS.

These walls are one brick thick. The winding form is taken for supposed economy of material.

archway was the double bed; one chamber was Mr. Jefferson's room, and the other was his wife's dressing-room; when he arose the morning he got out of bed into his own room, and Mrs. Jefferson got out into her room. After his wife's death her room became his study, and the partition wall between it and the library being taken down, the whole was thrown into the present large apartment. Over the archway in which the bed is placed is a long closet reached by a step-ladder placed in another closet at the foot of the bed. In this was stored in summer the winter clothes of the family, and in winter their summer habiliments. At the other side of the arch there is a small door, so that persons going from one room to the other had no need to clamber over the bed.

In the smaller chamber, when it became his study, stood Mr. Jefferson's writing-chair, which was made to suit his peculiar needs; the chair itself was high-backed, well rounded, and cushioned, and in front of it extended a cushioned platform, on which Mr. Jefferson found it very pleasant to stretch his legs, being sometimes troubled with swellings of the smaller veins of these limbs. The writing-table was so made that it could be drawn up over this platform, legs, and all, and pushed down when it was not in use. The top of this table turned on a pivot; on one side of it were his writing materials,

and on the other was the little apparatus by which he made copies of all his letters. By his side was another revolving table, on which his books of reference lay, or were held open at proper angles. Near him also stood a pair of large globes; and, if he wished to study anything outside of this world, he had in the room two long telescopes mounted on brass

tripods. Convenient also were his violins, one a Cremona, and the other the bass-viol saved from the Shadwell fire. Besides the book-shelves and the somewhat simple furniture of the library, there were a number of oddly contrived little closets, in which were stored his multitudinous manuscripts. There is a writing-table now in the possession of the family, which was frequently used by Mr. Jefferson, and which is very ingeniously contrived. Two of its four legs are hollow, and in these run rods resting upon springs by which the table can be easily elevated, the other two legs being also extensible, but in a different way. When Mr. Jefferson was tired of writing in a sitting position, he could stand up, and raise this table to the desired height. When he wished to use it as a reading-stand, the top could be inclined at any angle, and a strip of brass was brought into use to keep the books and papers from sliding off.

Opening from the library was a large room inclosed with glass, which was intended for a conservatory, but was used by Mr. Jefferson

IN THE COLONNADE OF THE UNIVERSITY.

IN CHARLOTTESVILLE.

as his work-room. There he had a work-bench, with all sorts of carpenter's tools, with which he constructed a great many of the small conveniences he invented.

The house was not richly furnished, although it contained all that was needed, Mr. Jefferson's chief attention in the way of adornment being given to that which would be permanent;—the floor, for instance, of the large semi-octagonal room back of the great hall was made of fine cherry and beech laid in a handsome pattern, and is still in perfect condition. But many of the visitors of distinction from this country and foreign lands, who used to flock to this hospitable mansion, never saw these beautiful floors, for Jefferson frequently entertained the most distinguished company long before his house was finished, when the doors were made of unplanned boards, the floors of loose planks, and the walls unplastered.

Over the door of the western front was the clock, which had one face for the portico and another for the hall. I am told that a clock-maker was brought over from Germany to make this clock, and another for the University, and that he afterwards started a flourishing business in Charlottesville. The weights of this clock, which ran eight days, were cannon-balls suspended by chains in the front corners of the hall, and descending into the cellar through holes in the floor. As one of these balls made its weekly journey down the wall, it touched, and turned over, the first thing every morning, a

metal plate, on which was painted the day of the week. There was a weather-vane on top of the house, but as Mr. Jefferson did not care to

go out at all hours and in all kinds of weather to see which way the wind was blowing, this vane was connected by a rod with a dial under the roof of the porch, so that it was only necessary to step outside the door and look up at this dial to see to what quarter the hand upon it was pointing. Another very curious contrivance was a little dumb-waiter, not more than six inches wide, which ran from the wine-cellar to the dining-room, its upper opening being covered with a movable panel in the wood-work of the mantel-piece. In this dumb-waiter were two shelves, each one large enough to contain a bottle of wine; the butler put these in place in the cellar, and when the master wanted them he pulled them up.

Not only in his house, but in its grounds, Jefferson's ingenuity gave itself full scope. In order that every one might take whatever degree of exercise inclination or the weather made desirable, several "roundabouts" were laid out on the varying surface of the mountain. These were walks or roads which enveloped the house, one being of quite moderate length, and not far from the mansion, while the longest was several miles in extent, in one part running by the banks of the River Rivanna at the base of the mountain. Here one could walk or drive around and around, always amid fair scenery, and sometimes reaching points from which could be had the most lovely views of far-stretching plains and mountains.

These grounds were abundantly enjoyed by Jefferson's numerous friends, especially perhaps those from Europe, who were not accustomed to see art so pleasantly commingled with what must have appeared to them as the wildest nature. Jefferson was a very systematic man, and could always be relied upon to appear at meal-time, but one day dinner was long kept waiting for his visitor, M. Volney, and himself, who were out walking. It afterwards appeared that the two philosophers had been detained by the labor of damming up a little stream in order that they might design a picturesque waterfall. A portrait of Jefferson by Kosciusko used to hang in the room occupied by Mrs. Randolph, the oldest daughter, a flattering inscription, placed beneath it by the artist, having banished it from the more public apartments. What became of this portrait is not known.

The entrance hall, in which stood, very appropriately on opposite sides, busts of Jefferson and Alexander Hamilton, is a somewhat remarkable apartment. It is the largest room in the house, and is as high as the dome. There is a railed gallery in it which connects the chambers in the upper part of the building. It has been supposed that there was to have been a staircase in this hall, communicating with this gallery; but none was ever built,

access to the gallery and the upper rooms being obtained by small and inadequate stairways in inside passages. The walls of the hall were adorned not only with horns of elk and moose, interspersed with Indian and Mexican weapons and implements, but with great bones of mastodons, and other fossil remains, and with huge specimens of native minerals. The whole collection is calculated to produce a very American impression on a foreign visitor.

Indoors and out, wherever one might wander through the apartments or grounds of this delightful home, one could not fail to perceive that the mind or the hand of Thomas Jefferson was at the bottom of everything. He thought nothing so large or so small that his ingenuity or his care need not be exercised upon it. With his own hands he made all the plans for the buildings of the University of Virginia, and he has left behind him the carefully prepared drawings of a gate-latch which he invented.

Jefferson's hope that his only surviving child would be left the mistress of Monticello was not fulfilled. The times were hard, and, although after his death all the estates were sold, the debts were not paid, and Mrs. Randolph was obliged to leave this happy "Little Mountain," which was never again occupied by Jefferson's descendants.

The first purchaser of Monticello was a Dr. Barclay, who was afflicted with the *morus multicaulis* disease, and he cut down many of the beautiful trees about the house, some of them exotics, for the purpose of planting a mulberry grove,—the leaves of which were to feed the silk-worms which were to become the inhabitants of the halls and chambers of the Jeffersonian mansion. But his cocoons proving to be anything but golden, the doctor gave up his silken dreams and sold the estate.

The next purchaser, Captain Levy, kept the house in good condition; but the civil war and the litigations among his heirs, which continued for some fifteen years after the captain's death, had a depressing effect upon the beauties of Monticello. If it had been a modern-built house it would have gone to wreck and ruin; but Jefferson built it to stay; and, although it suffered very much, especially in regard to shutters, window-sashes, and water-spouts, and although the terraced walks which stretched over the two lines of out-buildings connecting the main building with the pavilions were destroyed, and were replaced by ordinary roofs, the whole establishment has been put in excellent order by the present owner, a nephew of Captain Levy, and is now as sound and substantial a country mansion as it ever was. There is a modern air about its furnishings and fittings which is not Jeffersonian, but the house is still Monticello.

But Jefferson's orchards and terraced gardens, the serpentine flower-borders on the western lawn, to which came yearly contributions from the Jardin des Plantes of Paris, and the beautiful "roundabout" walks and drives have all disappeared; while in the little graveyard on the mountain-side, around the simple monument erected to the memory of the "Author of the Declaration of Independence, of the Statute of Virginia for Religious Freedom, and Father of the University of Virginia," lie the bones of five generations of his descendants, in the only ground they inherited from him.

Although Thomas Jefferson died owing much money, no shadow of debt now rests

upon his fame. Having no son, his grandson, Thomas Jefferson Randolph, became, at an early age, the general manager of his estates; and, at the death of his grandfather, Mr. Randolph—then living at Edge Hill, a large neighboring estate, which had come by original grant to the Randolph family—set himself to work to pay Mr. Jefferson's debts. In this labor of love he was assisted by his daughters, who established a school, which soon became a noted one, for the sole purpose of helping their father pay what was due to the creditors of their great ancestor. Their efforts were entirely successful, for many years did not elapse before every cent was paid.

Frank R. Stockton.

[BEGUN IN THE NOVEMBER NUMBER.]

LINCOLN'S NOMINATION AND ELECTION.

ABRAHAM LINCOLN: A HISTORY.*

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE BALTIMORE NOMINATIONS.

HOUGH the compact voting body of the South had retired from the Charleston Convention, her animating spirit yet remained in the numbers and determination of the anti-Douglas delegates. When on Tuesday morning, May 1st, the eighth day, the convention once more met, the Douglas men, with a view to making the most of the dilemma, resolved to force the nomination of their favorite. But there was a lion in the path. Usage and tradition had consecrated the two-thirds rule. Stuart, of Michigan, tried vainly to obtain the liberal interpretation, that this meant "two-thirds of the votes given," but Chairman Cushing ruled remorselessly against him, and at the instance of Howard, of Tennessee, the convention voted (141 to 112) that no person should be declared nominated who did not receive two-thirds of all the votes the full convention was entitled to cast.

This sealed the fate of Douglas. The Electoral College numbered 303; 202 votes therefore were necessary to a choice. Voting for candidates was duly begun, and continued throughout all the next day (Wednesday, May 2d). Fifty-seven ballots were taken in

all; Douglas received 145½ on the first, and on several subsequent ballots his strength rose to 152½. The other votes were scattered among eight other candidates with no near approach to agreement.*

The dead-lock having become unmistakable and irremediable, and the nomination of Douglas under existing conditions impossible, all parties finally consented to an adjournment, especially as it became evident that unless this were done the sessions would come to an end by mere disintegration. Therefore, on the tenth day (May 3d), the Charleston Convention formally adjourned, having previously resolved to reassemble on the 18th of June, in the city of Baltimore, with a recommendation that the several States make provision to fill the vacancies in their delegations.

Mr. Yancey and his seceders had meanwhile organized another convention in St. Andrew's Hall. Their business was of course to report substantially the platform rejected by the Douglasites, and for which rejection they had retired. Mr. Yancey then explained to them that the adoption of this platform was all the action they proposed to take until the "rump democracy" should make their nomination, when, he said, "it may be our privilege to indorse the nominee, or our duty to proceed to make a nomination." Other seced-

* The first ballot stood: Stephen A. Douglas, of Illinois, 145½; James Guthrie, of Kentucky, 35½; Daniel S. Dickinson, of New York, 7; R. M. T. Hunter, of Virginia, 42; Andrew Johnson, of Tennessee, 12;

Joseph Lane, of Oregon, 6; Jefferson Davis, of Mississippi, 1½; Isaac Toucey, of Connecticut, 2½; Franklin Pierce, of New Hampshire, 1.

ers were more impatient, and desired that something be done forthwith; but as the sessions were continued to the second and third day, their overflowing zeal found a safety-valve in their speeches. Mr. Yancey's programme prevailed, and they also adjourned to meet again in Richmond on the 11th of June.

At the time of the disruption, rumors were current in Charleston that the movement, if not prompted, was at least encouraged and sustained by telegrams from leading senators and representatives then at their Congressional duties in Washington. As the day for reassembling in Baltimore drew near, the main fact was abundantly proved by the publication of an address, signed by Jefferson Davis, Toombs, Iversen, Stoddell, Benjamin, Mason, and some fourteen others, in which they undertook to point out a path to union and harmony in the Democratic party. They recited the withdrawal of eight States at Charleston, and indorsed the step without qualification. "We cannot refrain," said the address, "from expressing our admiration and approval of this lofty manifestation of adherence to principle, rising superior to all considerations of expediency, to all trammels of party, and looking with an eye single to the defense of the constitutional rights of the States." They then alleged that the other Democratic States remained in the convention only to make a further effort to secure "some satisfactory recognition of sound principles," declaring, however, their determination also to withdraw if their just expectation should be disappointed. The address now urged that the seceders should defer their meeting at Richmond, but that they should come to Baltimore and endeavor to effect "a reconciliation of differences on a basis of principle." If the Baltimore Convention should adopt "a satisfactory platform of principles,"—and their votes might help secure it,—then cause of dissension would have ceased. "On the other hand," continues the address, "if the convention, on reassembling at Baltimore, shall disappoint the just expectations of the remaining Democratic States, their delegations cannot fail to withdraw and unite with the eight States which have adjourned to Richmond." The address, in another paragraph, explained that the seventeen Democratic States which had voted at Charleston for the seceders' platform, "united with Pennsylvania alone, comprise a majority of the entire electoral vote of the United States, able to elect the Democratic nominees against the combined opposition of all the remaining States."

This was a shrewd and crafty appeal. Under an apparent plea for harmony lurked an insidious invitation to Delaware, Virginia,

North Carolina, Missouri, Tennessee, Kentucky, California, Oregon, and Pennsylvania to join the seceders, reconstruct the Democratic party, cut off all the "popular sovereignty" recusants, and secure perpetual ascendancy in national politics through the consolidated South. The signers of this address, forgetting their own constant accusation of "sectionalism" against the Republicans, pretended to see no impropriety in proposing this purely selfish and sectional alliance. If it succeeded, their triumph in the Union was irresistible and permanent; if it failed, it served to unite the South for secession and a slave confederacy.

If any Democrat harbored a doubt that the proposed reconciliation meant simply a reunion on the Davis-Yancey platform, the doubt was soon removed. In the Senate of the United States, Jefferson Davis was pressing to a vote his caucus resolutions, submitted in February, to serve as a model for the Charleston platform; and this brought on a final discussion between himself and Douglas.

Davis had begun the debate on the 7th of May by a savage onslaught on "Squatter Sovereignty"—a fallacy, he said, fraught with mischief more deadly than the fatal opium, because it spread its poison over the whole Union.* Douglas took up the gauntlet, and, replying on May 15th and 16th, said he could not recognize the right of a caucus of the Senate or the House to prescribe new tests for the Democratic party. Senators were not chosen for the purpose of making platforms. That was the duty of the Charleston Convention, and it had decided in his favor, platform, organization, and least of all the individual, by giving him a majority of fifty votes over all the other candidates combined. He reprobated the Yancey movement as leading to dissolution and a Southern confederacy. The party rejected this caucus platform. Should the majority, he asked, surrender to the minority? † Davis, replying on the 17th, contended that Douglas had on the Kansas policy of the Administration put himself outside the Democratic organization. He desired no divided flag for the party. He preferred that the senator's banner should lie in its silken folds to feed the moth; "but if it impatiently rustles to be unfurled in opposition to ours, we will plant our own on every hill." ‡ Douglas retorted, and again attacked the caucus dictation. Why, he asked, are all the great measures for the public good made to give place to the emergency of passing some abstract resolutions on the subject of politics to reverse the Democratic plat-

* *Globe*, May 7th, 1860, p. 1940.

† *Globe*, May 15th and 16th, 1860. Appendix, p. 312.

‡ *Globe*, May 17th, 1860.

form, undersupposition that the representatives of the people are men of weak nerve who are going to be frightened by the thunders of the Senate Chamber? * Davis rejoined, that they wanted a new article in the creed because they could not get an honest construction of the platform as it stands. "If you have been beaten on a rickety, double-construed platform, kick it to pieces, and lay one broad and strong, on which men can stand." "We want nothing more than a simple declaration that negro slaves are property, and we want the recognition of the obligation of the Federal Government to protect that property like all other." † A somewhat restrained undertone of personal temper had been running through the debate, and Jefferson Davis could not resist an expression of contempt for his opponent. "The fact is," said he, "I have a declining respect for platforms. I would sooner have an honest man on any sort of a rickety platform that you could construct, than to have a man I did not trust on the best platform which could be made."

Douglas promptly called attention to the inconsistency of Davis's method of forcing his resolutions with one breath and avowing his indifference to a platform with another, especially as Yancey and his followers had seceded on the platform and not on the man; but he did not press his adversary to the wall, as he might have done, on the insincerity which Davis's sneer exposed. He was hampered by his own attitude as a candidate. Douglas, who had received a hundred and fifty votes at Charleston, and who expected the whole at Baltimore, could not let his tongue wag as freely as Davis, who had received only a vote and a half at Charleston, and could count on none at Baltimore; else he might have denounced him on the score of patriotism. For Jefferson Davis, like Yancey, only not so constantly, and like so many others of that secession coterie, blew hot and cold about disunion as occasion demanded. This same debate of May 17th furnished an instructive example.

In the beginning of the day's discussion Davis indulged in a repetition of the old alarm-cry:

"And so, sir, when we declare our tenacious adherence to the Union, it is the Union of the Constitution. If the compact between the States is to be trampled into the dust; if anarchy is to be substituted for the usurpation which threatened the Government at an earlier period; if the Union is to become powerless for the purpose for which it was established, and we are vainly to appeal to it for protection,—then, sir, conscious of the rectitude of our course, and self-reliant within ourselves, we look beyond the confines of the Union for the maintenance of our rights." ‡

* *Globe*, May 17th, 1860.

† *Globe*, May 17th, 1860, p. 2155.

But after Douglas had made a damaging exposure of Yancey's disunion intrigues, which had come to light, and had charged their animus on the Charleston seceders, Davis changed his tone. He said there were not more than seventy-five men in the lodges of the Southern Leagues. He did not think the Union was in danger from them.

"I have great confidence," said he, "in the strength of the Union. Every now and then I hear that it is about to tumble to pieces; that somebody is going to introduce a new plank into the platform, and if he does, the Union must tumble down; until at last I begin to think it is such a rickety old platform that it is impossible to prop it up. But then I bring my own judgment to bear, instead of relying on witnesses, and I come to the conclusion that the Union is strong and safe,—strong in its power as well as in the affections of the people." §

The debate made it very plain that it was not reconciliation but domination which the South wanted. So in due time (May 25th) the Jefferson Davis resolutions, affirming the "property" theory and the "protection" doctrine, were passed by a large majority of the Democratic senators.

When the Charleston Convention proper reassembled at Baltimore, it was seen that the programme laid out by Jefferson Davis and others in their published address had been duly adopted. The seceders had met at Richmond, taken a recess, and now appeared at Baltimore making application for readmission. But some of the States that withdrew at Charleston had sent contesting delegations, and it resolved itself into tangled rivalry and quarrel of platforms, candidates, and delegations all combined. For four days a furious debate raged in the convention during the day, while rival mass-meetings in the streets at night called each other "disorganizers," "bolters," "traitors," "disunionists," and "abolitionists." When Douglas, before a test-vote was reached, sent a dispatch suggesting that the party and the country might be saved by dropping his name and uniting upon some other candidate, his followers suppressed the dispatch.

On the fifth day at Baltimore the Democratic National Convention underwent its second "crisis," and suffered its second disruption. This time, also, the secession was somewhat broadened; Chairman Cushing resigned his seat, and Virginia, North Carolina, Tennessee, Delaware, Maryland, Kentucky, and California withdrew wholly or in part to join the States which had gone out at Charleston.

For the present the disunion extremists were keeping their scheme too well masked to establish clearly its historical record. But the signs

‡ *Globe*, May 17th, 1860, p. 2151.

§ *Globe*, May 17th, 1860, p. 2156.

and fragments of their underplot are evident. Here at Baltimore, as at Charleston, and as on every critical occasion, Mr. Yancey was conspicuously present. Here, as elsewhere, he was no doubt persistently intriguing for disunion in secret while ostentatiously denying disunion purposes in public.

But little remained to do after the disruption at Baltimore, and that little was quickly done. The fragments of the original convention continued their session in the Front-street Theatre, where they had met, and on the first ballot nominated Stephen A. Douglas for President by an almost unanimous vote. The seceders organized, under the chairmanship of Caleb Cushing, in Maryland Institute Hall, and also by a nearly unanimous ballot nominated as their candidate for President, John C. Breckinridge, of Kentucky. Then Mr. Yancey, who in a street mass-meeting had declared that he was neither for the Union *per se* nor for disunion *per se*, but for the Constitution,* announced that the Democracy, the Constitution, and, through them, the Union were yet safe.

A month prior to the reassembling of the Charleston "Kumps" above described, Baltimore had already witnessed another Presidential convention and nomination, calling itself peculiarly "National," in contradistinction to the "sectional" character which it charged upon the Democratic and Republican parties alike. This was a third party, made up mainly of former Whigs whose long-cherished party antagonisms kept them aloof from the Democrats in the South and the Republicans in the North. In the South, they had been men whose moderate antislavery feelings were outraged by the repeal of the Missouri Compromise and the Lecompton trick. In the North, they were those whose traditions and affiliations revolted at the extreme utterances of avowed abolitionists. In both regions many of them had embraced Know-nothingism, more as an alternative than from original choice. The Whig party was dissolved; Know-nothingism had utterly failed — their only resource was to form a new party.

In the various States they had, since the defeat of Fillmore in 1856, held together a minority organization under names differing in different localities. All these various factions and fragments sent delegations to Baltimore, where they united themselves under the designation of the Constitutional Union Party. They proposed to take a middle course between Democrats and Republicans, and to allay sectional strife by ignoring the slavery question.

Delegates of this party, regular and irregu-

lar, from some twenty-two States, convened at Baltimore on the 9th of May. John J. Crittenden, of Kentucky, called the meeting to order, and Washington Hunt, of New York, was made both temporary and permanent chairman. They adopted as their platform a single resolution declaring in substance that they would "recognize no other political principle than the Constitution of the country, the Union of the States, and the enforcement of the laws." They had no reasonable hope of direct success at the polls in November; but they had a clear possibility of defeating a popular choice, and throwing the election into the House of Representatives; and in that case their nominee might stand on high vantage-ground as a compromise candidate. This possibility gave some zest to the rivalry among their several aspirants. On their second ballot, a slight preponderance of votes indicated John Bell, of Tennessee, as their favorite, and the convention made his nomination unanimous. Mr. Bell had many qualities desirable in a candidate for President. He was a statesman of ripe experience, and of fair, if not brilliant, fame. Though from the South, his course on the slavery question had been so moderate as to make him reasonably acceptable to the North on his mere personal record. He had opposed the repeal of the Missouri Compromise and the Lecompton outrage. But upon this platform of ignoring the political strife of six consecutive years, in which he had himself taken such vigorous part, he and his followers were of course but as grain between the upper and nether mill-stones.

This party becomes historic, not through what it accomplished, but by reason of what a portion of it failed to perform. Within one year from these pledges to the Constitution, the Union, and the enforcement of the laws, Mr. Bell and most of his Southern adherents in the seceding States were banded with others in open rebellion. On the other hand, Mr. Everett and most of the Northern members, together with many noble exceptions in the border slave States, like Mr. Crittenden, of Kentucky, supported the Government in the war with patriotic devotion.

LINCOLN NOMINATED AT CHICAGO.

IN recognition of the growing power and importance of the great West, the Republican National Convention was called to meet in Chicago on the 16th of May. The former Presidential canvass, though resulting in the defeat of Frémont, had nevertheless shown the remarkable popular strength of the Republican party in the country at large; since then, its double victory in Congress against Lecompton,

* Halstead, *The Conventions of 1860*.

and at the Congressional elections over the representatives who supported Lecompton, gave it confidence and aggressive activity. But now it received a new inspiration and impetus from the Charleston disruption. Former possibility was suddenly changed to strong probability of success in the coming Presidential election. Delegates were not only quickened with a new zeal for their principles; the growing chances spurred them to fresh efforts in behalf of their favorite candidates. Those who had been prominently named were diverse in antecedents and varied in locality, each however presenting some strong point of popular interest. Seward, of New York, a Whig of preëminent fame; Chase, of Ohio, a talented and zealous antislavery Democrat, an original founder of the new party; Dayton, of New Jersey, an old Whig high in personal worth and political service; Cameron, of Pennsylvania, a former Democrat, now the undisputed leader of an influential tariff State; Bates, of Missouri, an able and popular antislavery Whig from a slave State; and last, but by no means least in popular estimation, Lincoln, of Illinois.

The idea of making Lincoln a Presidential candidate had occurred to the minds of many during his growing fame. The principle of natural selection plays no unimportant part in the politics of the United States. There are always hundreds of newspapers ready to "nail to the mast-head" the name of any individual which begins to appear frequently in dispatches and editorials. A few months after the close of the Lincoln-Douglas debates, and long before the Ohio speeches and the Cooper Institute address, a warm personal friend, the editor of an Illinois newspaper, wrote him an invitation to lecture, and added in his letter:

"I would like to have a talk with you on political matters, as to the policy of announcing your name for the Presidency, while you are in our city. My partner and myself are about addressing the Republican editors of the State on the subject of a simultaneous announcement of your name for the Presidency."*

To this Lincoln replied:

"As to the other matter you kindly mention, I must in candor say I do not think myself fit for the Presidency. I certainly am flattered and gratified that some partial friends think of me in that connection; but I really think it best for our cause that no concerted effort, such as you suggest, should be made."†

A much more hopeful ambition filled his mind. Notwithstanding his recent defeat, he did not think that his personal contest with Douglas was yet finished. He had the faith and the patience to wait six years for a chance to repeat his political tournament with the "Little Giant." From his letter quoted in a

previous chapter we know he had resolved to "fight in the ranks" in 1860. From another, we know how generously he kept faith with other Republican aspirants.

"If Trumbull and I were candidates for the same office you would have a right to prefer him, and I should not blame you for it; but all my acquaintance with you induces me to believe you would not pretend to be for me while really for him. But I do not understand Trumbull and myself to be rivals. You know I am pledged not to enter a struggle with him for the seat in the Senate now occupied by him; and yet I would rather have a full term in the Senate than in the Presidency."‡

This spirit of fairness in politics is also shown by the following letter, written apparently in response to a suggestion that Cameron and Lincoln might form a popular Presidential ticket:

"Yours of the 24th ult. was forwarded to me from Chicago. It certainly is important to secure Pennsylvania for the Republicans in the next Presidential contest; and not unimportant to also secure Illinois. As to the ticket you name, I shall be heartily for it after it shall have been fairly nominated by a Republican National Convention; and I cannot be committed to it before. For my single self, I have enlisted for the permanent success of the Republican cause; and for this object I shall labor faithfully in the ranks, unless, as I think not probable, the judgment of the party shall assign me a different position. If the Republicans of the great State of Pennsylvania shall present Mr. Cameron as their candidate for the Presidency, such an indorsement of his fitness for the place could scarcely be deemed insufficient. Still, as I would not like the public to know, so I would not like myself to know, I had entered a combination with any man to the prejudice of all others whose friends respectively may consider them preferable."§

Not long after these letters, at some date near the middle of the winter of 1859-60, the leaders of the Republican party of Illinois met at Springfield, the capital of the State, and in a more pressing and formal manner requested him to permit them to use his name as a Presidential candidate, more with the idea of securing his nomination as Vice-President than with any further expectation. To this he now consented. His own characteristic language, however, plainly reveals that he believed this would be useful to him in his future senatorial aspirations solely, and that he built no hopes whatever on national preferment. A quarrel was going on among rival aspirants to the Illinois governorship, and Lincoln had written a letter to relieve a friend from the imputation of treachery to him in the recent senatorial contest. This act of justice was now used to his disadvantage in the scramble for the Illinois Presidential delegates, and he wrote as follows:

"I am not in a position where it would hurt much for me not to be nominated on the national ticket; but I am where it would hurt some for me to not get the

Springfield, April 26, 1859.

St. J. Cockett, Esq.

My dear Sir,

Your of the 13th is just received. My engagements are such that I can not, at any very early day, visit Rock Island, to deliver a lecture, or for any other object.

As to the other matter you kindly mention, I must, in candor, say I do not think myself fit for the Presidency. I certainly am ^{flattered and} gratified that some partial friends think of me in that connection; but I really think it best for our cause that no

~~particular effort should be made to get me nominated.~~

Let this be considered confidential.

Yours very truly,
A. Lincoln.

Illinois. What I expected when I wrote the letter to Mr. Judd and others is now happening. Your assailants are most bitter against me; and they will no longer spare me, lay to the Bates egg in the South, and to the Seward egg in the North, and go far towards squeezing me out in the middle with nothing. Can you not help me a little in this matter?

The extra vigilance of his friends thus invoked, it turned out that the Illinois Republicans sent a delegation to the Chicago Convention, not only full of personal devotion to Lincoln, but composed of men of the highest standing, and of consummate political ability, and their enthusiastic efforts in his behalf among the delegations from other States contributed largely to the final result.

The political campaign had now so far taken shape that its elements and chances could be calculated with more than usual accuracy. The Charleston Convention had been disrupted on the 1st of May, and adjourned on May 3d; the nomination of John Bell by the Constitutional Union party occurred on May 9th. The Chicago Convention met on May 16th; and while there was at that date yet great uncer-

tainty as to whom the dissevered fragments of the Democratic party would finally nominate, little doubt existed that both the Douglas and Buchanan wings would have candidates in the field. With their opponents thus divided, the plain policy of the Republicans was to find a candidate on whom a thorough and hearty union of all the elements of the opposition could be secured. The party was constituted of somewhat heterogeneous material; a lingering antagonism remained between former Whigs and Democrats, protectionists and free-traders, foreign-born citizens and Know-nothings. Only on a single point could all hitherto agree,—opposition to the extension of slavery.

But little calculation was needed to show that at the November polls four doubtful States would decide the Presidential contest. Buchanan had been elected in 1856 by the vote of all the slave States (save Maryland), with the help of the free States of New Jersey, Pennsylvania, Indiana, Illinois, and California. Change the first four or even the first three of these free States to the Republican side, and they, with the Frémont States of 1856, would elect the President against all the others com-

* Lincoln to Judd, Feb. 9th, 1860. MS. Also printed in a pamphlet.

bined. The Congressional elections of 1858 demonstrated that such a change was possible. But besides this, Pennsylvania and Indiana were, like Ohio, known as "October States," because they held elections for State officers in that month; and they would at that early date give such an indication of sentiment as would forecast their November vote for President, and exert a powerful, perhaps a decisive, influence on the whole canvass. What candidate could most easily carry New Jersey, Pennsylvania, Indiana, and Illinois, became therefore the vital question among the Chicago delegates, and especially among the delegates from the four pivotal States themselves.

William H. Seward, of New York, was naturally the leading candidate. He had been longest in public life, and was highest in official rank. He had been governor of the greatest State of the Union, and had nearly completed a second term of service in the United States Senate. Once a prominent Whig, his antecedents coincided with those of the bulk of the Republican party. His experience ran through two great agitations of the slavery question. He had taken important part in the Senate discussions which ended in the compromise measures of 1850, and in the new contest growing out of the Nebraska Bill his voice had been in every debate from "Repeal" to "Lecompton." He was not only firm in his antislavery convictions, but decided in his utterances. Discussing the admission of California, he proclaimed the "higher law" doctrine* in 1850; reviewing Dred Scott and Lecompton, he announced the "irrepressible conflict"† in 1858. He had tact as well as talent; he was a consummate politician, as well as a profound statesman. Such a leader could not fail of a strong following, and his supporters came to Chicago in such numbers, and of such prominence and character, as seemed to make his nomination a foregone conclusion. The delegation from New York worked and voted throughout as a unit for him, not merely to carry out their constituents' wishes, but with a personal zeal that omitted no exertion or sacrifice. They showed a want of tact, however, in carrying their street demonstrations for their

favorite a little to excess; they crowded together at the Richmond House, making that hotel the Seward headquarters, with somewhat too much ostentation; they marched every day to the convention with music and banners and badges; and when any mention was made of doubtful States, their more headlong members talked altogether too much of the campaign funds they intended to raise. All this occasioned a reaction,—a certain mental protest among both Eastern and Western delegates against what have in later days come to be characterized as "machine" methods.

The positive elements in Seward's character and career had developed, as always happens, strong antagonisms. Having many enthusiastic friends, he had also very active and decided opponents. One of the earliest symptoms of this among the delegates at Chicago was the existence of a strong undercurrent of opposition to his nomination. This opposition was as yet latent, and scattered here and there among many State delegations, but very intense, silently watching its opportunity, and ready to combine upon any of the other candidates. The opposition soon made a discovery: that of all the names mentioned, Lincoln's was the only one offering any chance for such a combination. It needed only the slightest comparison of notes to show that Dayton had no strength save the New Jersey vote; Chase little outside of the Ohio delegation; Cameron none but that of Pennsylvania, and that Bates had only his Missouri friends and a few in border slave States, which could cast no electoral vote for the Republicans. The policy of the anti-Seward delegates was therefore quickly developed, namely, to use Lincoln's popularity as a means to defeat Seward.

The credit of the nomination is claimed by many men, and by several delegations, but every such claim is wholly fictitious. Lincoln was chosen not by personal intrigue, but through political necessity. The Republican party was a purely defensive organization; the South had created the crisis which the new party was compelled to overcome. The

* "It is true indeed that the national domain is ours. It is true it was acquired by the valor and with the wealth of the whole nation. But we hold, nevertheless, no arbitrary power over it. We hold no arbitrary authority over anything, whether acquired lawfully or seized by usurpation. The Constitution regulates our stewardship; the Constitution devotes the domain to union, to justice, to defense, to welfare, and to liberty. But there is a higher law than the Constitution which regulates our authority over the domain, and devotes it to the same noble purposes. The territory is a part, no inconsiderable part, of the common heritage of mankind, bestowed upon them by the Creator of the uni-

verse. We are his stewards, and must so discharge our trust as to secure in the highest attainable degree their happiness."—William H. Seward, Senate speech, March 11th, 1850.

† "Shall I tell you what this collision means? They who think that it is accidental, unnecessary, the work of interested or fanatical agitators, and therefore ephemeral, mistake the case altogether. It is an irrepressible conflict between opposing and enduring forces, and it means that the United States must and will, sooner or later, become either entirely a slaveholding nation, or entirely a free-labor nation."—Seward, Rochester speech, October 25th, 1858.

as tendency of the free States, not the personal fortunes of Seward, hung in the balance. Political victory at the ballot-box or a vital transformation of the institutions of government was the immediate alternative before the free States.

Victory could only be secured by help of the electoral votes of New Jersey, Pennsylvania, Indiana, and Illinois. It was therefore a simple problem: What candidate could carry these States? None could answer this question so well as their own delegates, and these, when interrogated, still further reduced the problem by the reply that whoever else could, Seward certainly could not. These four States lay on the border land next to the South and to slavery. Institutions inevitably mold public sentiment; and a certain tenderness toward the "property" of neighbors and friends infected their people. They shrunk from the reproach of being "abolitionized." They would vote for a conservative Republican; but Seward and radicalism and "higher law" would bring them inevitable defeat.

Who, then, could carry these doubtful and pivotal States? This second branch of the question also found its ready answer. The contest in these States would be not against a Territorial slave code, but against "popular sovereignty"; not with Buchanan's candidate, but with Douglas; and for Douglas there was only a single antagonist, tried and true,—Abraham Lincoln. Such, we may reasona-

bly infer, was the substance of the discussion and argument which ran through the caucus-rooms of the delegates, day and night, during the 16th and 17th of May. Meanwhile the Seward men were not idle; having the large New York delegation to begin with, and counting the many positive committals from other States, their strength and organization seemed impregnable. The opposing delegations, each still nursing the chances of its own candidate, hesitated to give any positive promises to each other. At midnight of May 17th, Horace Greeley,* one of Seward's strongest opponents, and perhaps better informed than any other single delegate, telegraphed his conclusion "that the opposition to Governor Seward cannot concentrate on any candidate, and that he will be nominated."†

Chicago was already a city of a hundred thousand souls. Thirty to forty thousand visitors, full of life, hope, ambition, most of them from the progressive group of incircling North-western States, and strung to the highest tension of political excitement, had come to attend the convention. Charleston had shown a great party in the ebb-tide of disintegration, tainted by the spirit of disunion. Chicago exhibited a great party springing to life and power, every motive and force compelling coöperation and growth. The rush and spirit of the great city, and the

enthusiasm and hope of its visitors, blended and reacted upon each other as if by laws of chemical affinity. Something of the freshness and sweep of the prairie winds exhilarated the delegates and animated the convention.

GEORGE ASHMUN, OF MASSACHUSETTS.
(FROM A PHOTOGRAPH BY NOTMAN.)

No building in the city of Chicago at that time contained a hall with sufficient room for the sittings of the great assemblage. A temporary frame structure, which the committee of arrangements christened "The Wigwam," was therefore designed and erected for this especial use. It was said to be large enough to hold ten thousand persons, and whether or not that estimate was entirely accurate, a prodigious concourse certainly gathered each day within its walls.

The very first day's session (May 16th) demonstrated the successful adaptation of the structure to its uses. Participants and spectators alike were delighted with the ease of ingress and egress, the comfortable division of space, the perfection of its acoustic qualities. Every celebrity could be seen, every speech could be heard. The routine of organization, the choice of officers and committees, and the presentation of credentials were full of variety and zest. Governor Edwin D. Morgan, of New York, as Chairman of the National Republican Committee, called the convention to order; and when he presented the historic name of David Wilmot, of Pennsylvania, for temporary chairman, the faith of the audience in the judgment of the managers was already won. The report of the committee on organ-

ization in the afternoon made George Ashmun, of Massachusetts, a most skillful parliamentarian, ready in decision and felicitous in his phrases, the permanent presiding officer. One thing was immediately and specially manifest: an overflowing heartiness and deep feeling pervaded the whole house. No need of a *claque*, no room for sham demonstration here! The galleries were as watchful and earnest as the platform. There was something genuine, elemental, uncontrollable in the moods and manifestations of the vast audience. Seats and standing-room were always packed in advance, and, as the delegates entered by their own separate doors, the crowd easily distinguished the chief actors. Blair, Giddings, Greeley, Evarts, Kelley, Wilmot, Schurz, and others were greeted with spontaneous applause, which, rising at some one point, grew and rolled from side to side and corner to corner of the immense building, brightening the eyes and quickening the breath of every inmate.*

With the second day's proceedings the interest of delegates and spectators was visibly increased, first by some sharp-shooting speeches about credentials, and secondly by the main event of the day,—the report from the platform committee. Much difficulty was expected on this score, but a little time had smoothed the way with an almost magical effect. The great outpouring of delegates and people, the self-evident success of the gathering, the harmonious, almost joyous, beginning of the deliberations in the first day's session, were more convincing than logic in solidifying the party. These were the premonitions of success; before the signs of victory all spirit of faction was fused into a generous glow of emulation.

The eager convention would have accepted a weak or defective platform; the committee, on the contrary, reported one framed with remarkable skill. It is only needful to recapitulate its chief points. It denounced disunion, Lecomptonism, the property theory, the dogma that the Constitution carries slavery to Territories, the reopening of the slave-trade, the popular sovereignty and non-intervention fallacies, and denied "the authority of Congress, of a Territorial legislature, or of any individuals to give legal existence to slavery in any Territory of the United States." It opposed any change in the naturalization laws. It recommended an adjustment of import duties to encourage the industrial interests of the whole country. It advocated the immediate admission of Kansas, free homesteads

* One of the authors was a spectator at all the sessions of the convention, and witnessed the scenes in the Wigwam which he has endeavored to describe.

to actual settlers, river and harbor improvements of a national character, and a railroad to the Pacific Ocean. Bold on points of common agreement, it was unusually successful in avoiding points of controversy among its followers, or offering points for criticism to its enemies.

It is not surprising that Charleston and Chicago should furnish many striking contrasts. At the Charleston Convention, the principal personal incident was a long and frank speech from one Gauden, a Savannah slave-trader, in advocacy of the reopening of the African slave-trade.⁹ In the Chicago Convention, the exact and extreme opposite of such a theme created one of the most interesting of the

announces the right of all men to "life, liberty, and the pursuit of happiness." The convention was impatient to adopt the platform without change; several delegates urged objections, one of them pertinently observing that there were also many other truths enunciated in the Declaration of Independence. "Mr. President," said he, "I believe in the ten commandments, but I do not want them in a political platform." Mr. Giddings's amendment was voted down, and the antislavery veteran, feeling himself wounded in his most cherished philosophy, rose and walked out of the convention.

Personal friends, grieved that he should feel offended, and doubly sorry that the general

debates. The platform had been read and received with tremendous cheers, when Mr. Giddings, of Ohio, who was everywhere eager to insist upon what he designated as the "primal truths" of the Declaration of Independence, moved to amend the first resolution by incorporating in it the phrase which

"I tell you, fellow Democrats, that the African slave-trader is the true Union man [cheers and laughter]. I tell you that the slave-trading of Virginia is more immoral, more unchristian in every possible point of view, than that African slave-trade which goes to Africa and brings a heathen and worthless man here, christianizes him, and sends him and his posterity down the stream of time to enjoy the blessings of civilization. . . It has been my fortune to go into that noble old State to buy a few turkeys, and I have had to pay from \$1000 to \$2000 a head, when I could go to Africa and buy

harmony should be marred by even a single dissent, followed Mr. Giddings, and sought to change his purpose. While thus persuading him, the discussion had passed to the second resolution, when Mr. George William Curtis, of New York, seized the chance to renew substantially Mr. Giddings's amendment. There

better negroes for \$50 apiece. . . I advocate the repeal of the laws prohibiting the African slave-trade, because I believe it to be the true Union movement. I do not believe that sections whose interests are so different as the Southern and Northern States can ever stand the shocks of fanaticism unless they be equally balanced. I believe that by reopening this trade, and giving us negroes to populate the Territories, the equilibrium of the two sections will be maintained."—Speech of W. B. Gauden, of Georgia, in the Charleston Democratic National Convention, May 1st, 1860.

HANNIBAL HAMLIN.

were new objections, but Mr. Curtisswept them away with a captivating burst of oratory. "I have to ask this Convention," said he, "whether they are prepared to go upon the record before the country as voting down the words of the Declaration of Independence? . . . I rise simply to ask gentlemen to think well before, upon the free prairies of the West, in the summer of 1860, they dare to wince and quail before the assertions of the men in Philadelphia, in 1776—before they dare to shrink from repeating the words that these great men enunciated." "This was a strong appeal, and took the convention by storm,"* writes a recording journalist. A new vote formally embodied this portion of the Declaration of Independence in the Republican platform; and Mr. Giddings, overjoyed at his triumph, had already returned to his seat when the platform as a whole was adopted with repeated and renewed shouts of applause that seemed to shake the wigwam.

The third day of the convention (Friday, May 18th) found the doors besieged by an excited multitude. The preliminary business was disposed of,—the platform was made,—and every one knew the balloting would begin. The New York delegation felt assured of Seward's triumph, and made an effort to have its march to the convention, with banners and music, unusually full and imposing. It proved a costly display; for while the New York "irregulars" were parading the streets, the Illinoisans were filling the wigwam: when the Seward procession arrived, there was little room left except the reserved seats for the delegates. New York deceived itself in an-

* Halstead, "Conventions of 1860," p. 138.

other respect: it counted on the full New England strength, whereas more than half of it had already resolved to cast its vote elsewhere. This defection in advance practically insured Seward's defeat. New York and the extreme North-west were not sufficiently strong to nominate him, and in the nature of things he could not hope for much help from the conservative middle and border States. But this calculation could not as yet be so accurately made. Caucusing was active up to the very hour when the convention met, and many delegations went to the wigwam with no definite programme beyond the first ballot.

What pen shall adequately describe this vast audience of ten thousand souls? the low, wave-like roar of its ordinary conversation; the rolling cheers that greeted the entrance of popular favorites; the solemn hush which fell upon it during the opening prayer? There was just enough of some unexpected preliminary wrangle and delay to arouse the full impatience of both convention and spectators; but at length the names of candidates were announced. This ceremony was still in its simplicity. The more recent custom of short dramatic speeches from conspicuous and popular orators to serve as electrifying preludes, had not yet been invented. "I take the liberty," said Mr. Evarts, of New York, "to name as a candidate to be nominated by this convention for the office of President of the United States, William H. Seward." "I desire," followed Mr. Judd, "on

GEORGE WILLIAM CURTIS.

WILLIAM M. EVARTS (FROM AN OIL-PAINTING BY THOMAS HICKS. 1867.)

behalf of the delegation from Illinois, to put in nomination as a candidate for President of the United States, Abraham Lincoln, of Illinois." Then came the usual succession of possible and alternative aspirants who were to be complimented by the first votes of their states.—Dayton, Cameron, Chase, Bates, Collamer, McLean. The fifteen minutes required by this formality had already indisputably marked out and set apart the real contestants. The "complimentary" statesmen were lustily cheered by their respective State delegations; but at the names of Seward and Lincoln, the whole wigwam seemed to respond together.

There is something irresistibly exciting in the united voice of a great crowd. For a moment the struggle appeared to resolve itself into a contest of throats and lungs. Indiana seconded the nomination of Lincoln, and the applause was deafening. Michigan seconded the nomination of Seward; the New York delegation rose *en masse*, waved their hats, and joined the galleries in a shout which doubled the volume of any yet given. Then a portion of the Ohio delegates once more

seconded Lincoln, and his adherents, feeling themselves put upon their mettle, made an effort. "I thought the Seward yell could not be surpassed," wrote a spectator; "but the Lincoln boys were clearly ahead, and, feeling their victory, as there was a lull in the storm, took deep breaths all round, and gave a concentrated shriek that was positively awful, and accompanied it with stamping that made every plank and pillar in the building quiver."*

The tumult gradually died away, and balloting began. Here we may note another contrast. The Charleston Convention was reactionary and exclusive; it followed the two-thirds rule. The Chicago Convention was progressive and liberal; it adopted majority rule. Liberal even beyond this, it admitted the Territories and border slave States, containing only a minority or fraction of Republican sentiment, to seats and to votes. It was throwing a drag-net for success. Under different circumstances, these sentimental delegations might have become powerful in intrigue; but, dom-

* Halstead, "Conventions of 1860," p. 145.

inated as they were by deeper political forces, they afforded no distinct advantage to either candidate.*

Though it was not expected to be decisive, the very first ballot foreshadowed accurately

Missouri voted solid for her candidate, Bates, who also received a scattering tribute from other delegations. But all these compliments were of little avail to their recipients, for far above each towered the aggregates of the leading candidates: Seward, $173\frac{1}{2}$; Lincoln, 102.

In the groundswell of suppressed excitement which pervaded the convention there was no time to analyze this vote; nevertheless, delegates and spectators felt the full force of its premonition; to all who desired the defeat of Seward it pointed out the winning man with unerring certainty. Another little wrangle over some disputed and protesting delegate made the audience almost furious at the delay, and "Call the roll!" sounded from a thousand throats.

A second ballot was begun at last, and, obeying a force as sure as the law of gravitation, the former complimentary votes came rushing to Lincoln. The whole 10 votes of Collamer, 44 from Cameron, 6 from Chase and McLean, were now cast for him, followed by a scatter of additions along the whole roll-call. In this ballot Lincoln gained 79 votes, Seward only 11. The faces of the New York delegation whitened as the balloting progressed and as the torrent of Lincoln's popularity became a river. The result of the second ballot was: Seward, $184\frac{1}{2}$; Lincoln, 181; scattering, $99\frac{1}{2}$. When the vote of Lincoln was announced, there was a tremendous burst of applause, which

JOHN BELL, NOMINEE FOR PRESIDENT OF THE CONSTITUTIONAL UNION PARTY. (FROM A PHOTOGRAPH BY BRADY)

the final result. The "complimentary" candidates received the tribute of admiration from their respective States. Vermont voted for Collamer, and New Jersey for Dayton, each solid.† Pennsylvania's compliment to Cameron was shorn of six votes, four of which went at once for Lincoln. Ohio divided her compliment, 34 for Chase, 4 for McLean, and at once gave Lincoln her 8 remaining votes.

* These sentimental delegations were: Maryland, 11; Delaware, 6; Virginia, 22; Kentucky, 23; Texas, 6; Kansas, 6; Nebraska, 6; District of Columbia, 2. Total, 82 votes. Of these the leading candidates received as follows:

1st ballot.	Seward, 30	Lincoln, 21
2d "	" 35	" 30
3d "	" 33	" 43

Missouri might be counted in the same category; but, as she voted steadily for Bates through all the ballots, she did not in any wise influence the result.

† Each State cast a vote equal to double the number of its Electoral College.

the chairman prudently but with difficulty controlled and silenced.

The third ballot was begun amid a breathless suspense; hundreds of pencils kept pace with the roll-call, and nervously marked the changes on their tally-sheets. The Lincoln figures steadily swelled and grew. Votes came to him from all the other candidates,— $4\frac{1}{2}$ from Seward, 2 from Cameron, 13 from Bates, 18 from Chase, 9 from Dayton, 8 from McLean, 1 from Clay. Lincoln had gained $50\frac{1}{2}$. Seward had lost $4\frac{1}{2}$. Long before the official tellers footed up their columns, spectators and delegates rapidly made the reckoning and knew the result: Lincoln, $231\frac{1}{2}$; Seward, 180. Counting the scattering votes, 465 ballots had been cast, and 233 were necessary to a choice; only $1\frac{1}{2}$ votes more were needed to make a nomination.

A profound stillness suddenly fell upon the

wigwam; the men ceased to talk and the ladies to flutter their fans; one could distinctly hear the scratching of pencils and the ticking of telegraph instruments on the reporters' tables. No announcement had been made by the chair; changes were in order, and it was only a question of seconds who should speak first. While every one was leaning forward in intense expectancy, Mr. Carter sprang upon his chair and reported a change of four thousand votes from Chase to Lincoln. There was a moment's pause,—a teller waved his tally-sheet toward the skylight and shouted a name,—and then the boom of a cannon on the roof of the wigwam announced the nomination to the crowds in the streets, where shouts and salutes took up and spread the news. In the convention the Lincoln river now became an inundation. Amid the wildest hurrahs, delegation after delegation changed its vote to the victor.

A graceful custom prevails in orderly American conventions, that the chairman of the vanquished delegation is first to greet the nominee with a short address of party fealty and promise of party support. Mr. Evarts, the spokesman for New York, essayed promptly to perform this courteous office, but was delayed a while by the enthusiasm and confusion. The din at length subsided, and the presiding officer announced that on the third ballot Abraham Lincoln, of Illinois, received 364 votes, and "is selected as your candidate for President of the United States." Then Mr. Evarts, in a voice of unconcealed emotion, but with admirable dignity and touching eloquence, speaking for Seward and for New York, moved to make the nomination unanimous.

The interest in a National Convention usually ceases with the announcement of the principal nomination. It was only afterward that the delegates realized how fortunate a selection they made by adding Hannibal Hamlin, of Maine, to the ticket as candidate for Vice-President. Indeed, this was even more true of Mr. Lincoln. For the moment

EDWARD EVERETT, NOMINEE FOR VICE-PRESIDENT OF THE CONSTITUTIONAL UNION PARTY.

their chief self-congratulation was that they had secured the doubtful vote of the conservative States. Or rather, perhaps, might it be said that it was hardly the work of the delegates—it was the concurrent product of popular wisdom. Political evolution had with scientific precision wrought "the survival of the fittest." The weary delegates leaving Chicago on the various homeward-bound railroad trains that night, saw that already the excitement and enthusiasm of the convention was transferred from the wigwam to the country.

"At every station where there was a village, until after 2 o'clock, there were tar-barrels burning, drums beating, boys carrying rails, and guns great and small banging away. The weary passengers were allowed no rest, but plagued by the thundering of the cannon, the clamor of drums, the glare of bonfires, and the whooping of the boys, who were delighted with the idea of a candidate for the Presidency who thirty years before split rails on the Sangamon River—classic stream now and for evermore—and whose neighbors named him 'honest.' " *

LINCOLN ELECTED.

THUS the Presidential canvass in the United States for the year 1860 began with the very

* Halstead, "Conventions of 1860," p. 154.

HERSCHEL V. JOHNSON, CANDIDATE FOR VICE-PRESIDENT OF THE DOUGLAS WING OF THE DEMOCRATIC PARTY. (FROM A PHOTOGRAPH BY BRADY.)

unusual condition of four considerable parties, and four different candidates for President and Vice-President. In the order of popular strength, as afterward shown, they were:

First. The Republican party, which at the Chicago Convention had nominated as its candidate for President, Abraham Lincoln, of Illinois, and for Vice-President, Hannibal Hamlin, of Maine. Its animating spirit was a belief and declaration that the institution of slavery was wrong in morals and detrimental to society; its avowed policy was to restrict slavery to its present limits in the States where it existed in virtue of local constitutions and laws.

Second. The Douglas wing of the Democratic party, which at Baltimore nominated Stephen A. Douglas, of Illinois, for President, and whose candidate for Vice-President was Herschel V. Johnson, of Georgia.* It declared indifference as to the moral right or wrong of slavery, and indifference to its re-

striction or extension. Its avowed policy was to permit the people of a Territory to decide whether they would prevent or establish slavery, and it further proposed to abide by the decisions of the Supreme Court on all questions of constitutional law growing out of it.

Third. The Buchanan wing of the Democratic party, which at Baltimore nominated John C. Breckinridge, of Kentucky, for President, and Joseph Lane, of Oregon, for Vice-President. Its animating spirit was a belief and declaration that slavery was morally right and politically beneficial; its avowed policy was the extension of slavery into the Territories, and the creation of new slave States, whereby it might protect and perpetuate itself by a preponderance, or at least a constant equality, of political power, especially in the Senate of the United States. As one means to this end, it proposed the immediate acquisition of the island of Cuba.

Fourth. The Constitutional Union party, which in its convention at Baltimore nominated John Bell, of Tennessee, for President, and Edward Everett, of Massachusetts, for Vice-President. It professed to ignore the question of slavery, and declared that it would recognize no political principle other than "the Constitution of the Country, the Union of the States, and the enforcement of the Laws."

The first, most striking feature of the four-sided Presidential canvass which now began, was the personal pledge by every one of the candidates of devotion to the Union. Each of the factions was in some form charging disunion motives or tendencies upon part or all of the others;

* Benjamin Fitzpatrick, of Alabama, had been nominated at Baltimore, but he declined the nomination, and the National Committee substituted the name of Herschel V. Johnson, of Georgia.

STATE-HOUSE IN WHICH WAS LINCOLN'S OFFICE DURING HIS CAMPAIGN.

but each indignantly denied the allegation as to itself. To leave no possible doubt, the written letters of acceptance of each of the candidates emphasized the point. Lincoln invoked "the inviolability of the Constitution, and the perpetual union, harmony, and prosperity of all." Douglas made his pledge broad and full. "The Federal Union," wrote he, "must be preserved. The Constitution must be maintained inviolate in all its parts. Every right guaranteed by the Constitution must be protected by law in all cases where legislation is necessary to its enjoyment. The judicial authority, as provided in the Constitution, must be sustained, and its decisions implicitly obeyed and faithfully executed. The laws must be administered, and the constituted authorities upheld, and all unlawful resistance to these things must be put down with firmness, impartiality, and fidelity." "The Constitution and the equality of the States," wrote Breckinridge, "these are the symbols of everlasting union. Let these be the rallying cries of the people." Bell declared that, if elected, all his ability, strength of will, and official influence should be employed "for the maintenance of the Constitution and the Union against all opposing influences and tendencies." Even President Buchanan, in a little campaign speech from the portico of the Executive mansion, hastened to purge himself of the imputation of suspicion or fear on this point. He declared that neither of the Democratic conventions was "regular," and that therefore every Democrat was at liberty to vote as he thought proper. For himself, he preferred Breckinridge. The Democratic party, when divided for the moment, "has always closed up its ranks, and become more powerful even from defeat. It will never die whilst the Constitution and the Union survive. It will live to protect and defend both." *

No progress was made, however, toward a reunion of the Democratic party. The Buchanan faction everywhere waged unrelenting war on Douglas, both in public discussion and in the use of official patronage. The contest was made with equal obstinacy and bitterness in the Northern and the Southern States. Douglas, on his part, was not slow to retaliate. He immediately entered on an extensive campaign tour, and made speeches at many of the principal cities of the Northern States, and a few in the slave States. Everywhere he stigmatized the Breckinridge wing of the Democracy as an extremist and disunion fac-

tion,† charging that it was as obnoxious and dangerous as the Republicans. Whatever be his errors, it must be recorded to his lasting renown that he boldly declared for maintaining the Union by force. At Norfolk, Virginia, the question was put to him in writing. "I answer emphatically," replied Douglas, "that it is the duty of the President of the United States, and all others in authority under him, to enforce the laws of the United States passed by Congress, and as the courts expound them, and I, as in duty bound by my oath of fidelity to the Constitution, would do all in my power to aid the Government of the United States in maintaining the supremacy of the laws against all resistance to them, come from what quarter it might. In other words, I think the President, whoever he may be, should treat all attempts to break up the Union by resistance to the laws, as Old Hickory treated the nullifiers in 1832."‡

All parties entered upon the political canvass with considerable spirit; but the chances of the Republicans were so manifestly superior that their enthusiasm easily outran that of all their competitors. The character and antecedents of Mr. Lincoln appealed directly to the sympathy and favor of the popular masses of the Northern States. As pioneer, farm-laborer, flat-boatman, and frontier politician, they saw in him a true representative of their early if not their present condition. As the successful lawyer, legislator, and public debater in questions of high statesmanship, he was the admired ideal of their own aspirations. The popular fancy seized upon his personal characteristics as effective symbols of their zealous partisanship.

While the Illinois State Republican Convention was in session at Decatur (May 10th), about a week before the Chicago Convention, the balloting for State officers was interrupted by the announcement, made with much mystery, that "an old citizen of Macon County" had something to present to the convention. When curiosity had been sufficiently aroused, John Hanks, Lincoln's fellow-pioneer, and a neighbor of Hanks were suddenly marched into the convention, each bearing upright an old fence-rail, and displaying a banner with an inscription to the effect that these were two rails from the identical lot of three thousand which, when a pioneer boy, Lincoln had helped to cut and split to inclose his father's first farm in Illinois, in 1830. These emblems union. I do not believe that every Breckinridge man is a disunionist, but I do believe that every disunionist in America is a Breckinridge man."—Douglas, Baltimore speech, September 6th, 1860.

‡ Douglas, Norfolk speech August 25th, 1860.

* G. T. Curtis, "Life of Buchanan," Vol. II., p. 294.
 ** In my opinion there is a mature plan throughout the Southern States to break up the Union. I believe the election of a Republican is to be the signal for that attempt, and that the leaders of the scheme desire the election of Lincoln so as to have an excuse for dis-

Springfield, Ill. May 23. 1860

Hon: George Ashmun.

President of the Republican National Convention.

Sir:

I accept the nomination tendered me by the Convention over which you presided, and of which I am formally apprized in the letter of yourself and others, acting as a Committee of the Convention, for that purpose.

The declaration of principles and sentiments, which accompanies your letter, meets my ~~entire~~ approval; and it shall be my care not to violate, or disregard it, in any part.

Imploring the assistance of Divine Providence, and with due regard to the views and feelings of all who were represented in the Convention; to the rights of all the States, and territories, and people of the nation; to the inviolability of the Constitution, and the perpetual union, harmony, and prosperity of all, I am now happy to co-operate for the practical success of the principles declared by the Convention.

Your obliged friend, and fellow citizen
A. Lincoln

FAC-SIMILE OF LINCOLN'S LETTER OF ACCEPTANCE.

of his handiwork were received by the convention with deafening shouts, as a prelude to a unanimous resolution recommending him for President. Later, these rails were sent to Chicago; there, during the sittings of the National Republican Convention, they stood in the hotel parlor at the Illinois headquarters, lighted up by tapers, and trimmed with flowers by enthusiastic ladies. Their history and campaign incidents were duly paraded in the newspapers, and throughout the Union Lincoln's ancient and local *sobriquet* of "Honest Old Abe" was supplemented by the national epithet of "The Illinois Rail-splitter." Of the many humors and peculiarities of the cam-

paign, one feature deserves special mention. Political clubs, for parades and personal campaign work, were no novelty; now, however, the new expedients of a cheap yet striking uniform and a half-military organization were tried with marked success. When Lincoln made his New England trip, immediately after the Cooper Institute speech, a score or two of active Republicans in the city of Hartford appeared in close and orderly ranks, wearing each a cap and large cape of oil-cloth, and bearing over their shoulders a long staff, on the end of which blazed a brilliant torch-light. This first "Wide Awake" * Club, as it called itself, marching with soldierly step,

* We condense the following account of the origin of the "Wide Awakes" from memoranda kindly furnished us by Mr. William P. Fuller, one of the editors of the Hartford "Courant" in 1860, Major J. C. Kinney, at present connected with the paper, and General Joseph R. Hawley, the principal editor, now United States Senator from Connecticut, and who in 1860 marched in the ranks in the first "Wide Awake" parades.

The "Wide Awake" organization grew out of the first campaign meeting in Hartford on February 25th, 1860—State election campaign. Hon. Cassius M. Clay was the speaker, and after the meeting was escorted to the Allyn House by a torch-light parade.

Two of the young men who were to carry torches, D. G. Francis and H. P. Blair, being dry-goods clerks, in order to protect their clothing from dust and the oil liable to fall from the torches, had prepared capes of black cambric, which they wore in connection with the glazed caps commonly worn at the time. Colonel George P. Bissell, who was marshal, noticing the uniform, put the wearers in front, where the novelty of the rig and its double advantage of utility and show attracted much attention. It was at once proposed to form a campaign club of fifty torch-bearers with glazed caps and oil-cloth capes instead of cambric; the torch-bearing club to be "auxiliary to the Young Men's Republican Union." A meeting to organize formally

and military music, escorted Mr. Lincoln, on the evening of March 5th, from the hall where he addressed the people, to his hotel. The device was so simple and yet so strikingly effective that it immediately became the pattern for other cities. After the campaign opened, there was scarcely a county or village in the North without its organized and drilled association of "Wide Awakes," immensely captivating to the popular eye, and forming everywhere a vigilant corps to spread the fame of, and solicit votes for, the Republican presidential candidate. On several occasions twenty to thirty thousand "Wide Awakes" met in the larger cities and marched in monster torch-light processions through the principal streets.

His nomination also made necessary some slight changes in Mr. Lincoln's daily life. His law practice was transferred entirely to his partner, and instead of the small, dingy office so long occupied by him, he was now given the use of the Governor's room in the State-house, which was not needed for official business during the absence of the legislature. This also was a room of modest proportions, with scanty and plain furniture. Here Mr. Lincoln, attended by only his private secretary (Mr. Nicolay), passed the long summer days of the campaign, receiving the constant stream of visitors anxious to look upon a real presidential candidate. There was free access to him; not even an usher stood at the door; any one might knock and enter. His immediate personal friends from Sangamon County and central Illinois availed themselves largely of this opportunity. With men who had known him in field and forest he talked over the incidents of their common pioneer experience with unaffected sympathy and interest, as though he were yet the flat-boatman, surveyor, or village lawyer of the early days. The letters which came to him by hundreds, the newspapers, and the conversation of friends, kept him sufficiently informed of the progress of the campaign, in which personally he took a very slight part. He made no addresses, wrote no public letters, held no conferences. Political leaders several times came to make campaign speeches at the Republican wig-

was appointed for March 6th; but before the new uniforms were all ready, Abraham Lincoln addressed a meeting in Hartford on the evening of March 5th. After his speech, the cape-wearers of the previous meeting with a number of others who had secured their uniforms escorted Mr. Lincoln to the hotel.

The club was formally organized on the following night. Mr. William P. Fuller, city editor, had, in noticing this meeting for organization, written in the "Concent" of March 31: "THE WIDE AWAKES.—The Republican club-room last evening was filled as usual with those who are going to partake in the great Republican triumph in this State in April next," etc.,

wam in Springfield. But, beyond a few casual interviews on such occasions, the great presidential canvass went on with scarcely a private suggestion or touch of actual direction from the Republican candidate.

It is perhaps worth while to record Lincoln's expression on one point, which adds testimony to his general consistency in political action. The rise of the Know-nothing or American party, in 1854-5 (which was only a renewal of the Native-American party of 1844), has been elsewhere mentioned. As a national organization, the new faction ceased with the defeat of Fillmore and Donelson in 1856; its fragments nevertheless held together in many places in the form of local minorities, which sometimes made themselves felt in contests for members of the legislature and county officers; and citizens of foreign birth continued to be justly apprehensive of its avowed jealousy and secret machinery. It was easy to allege that any prominent candidate belonged to the Know-nothing party, and attended the secret Know-nothing lodges; and Lincoln, in the late senatorial, and now again in the presidential, campaign, suffered his full share of these newspaper accusations.

We have already mentioned that in the campaign of 1844 he put on record, by public resolutions in Springfield, his disapprobation of, and opposition to, Native-Americanism.* In the later campaigns, while he did not allow his attention to be diverted from the slavery discussion, his disapproval of Know-nothingism was quite as decided and as public. Thus he wrote in a private letter, dated October 30th, 1858:

"I understand the story is still told and insisted upon that I have been a Know-nothing. I repeat what I stated in a public speech at Meredosia, that I am not, nor ever have been, connected with the party called the Know-nothing party, or party calling themselves the American party. Certainly no man of truth, and I believe no man of good character for truth, can be found to say on his own knowledge that I ever was connected with that party." †

So also in the summer of 1860, when his candidacy for President did not permit his writing public letters, he wrote in a confidential note to a friend:

etc. The name "Wide Awakes" was here applied to the Republican Young Men's Union, torch-bearers included; but at the meeting of March 6th, the torch-bearers appropriated it by making it the distinctive title to their own special organization, which almost immediately, there as elsewhere, swallowed up the names and the memberships of other Republican clubs. Just one year after they escorted Mr. Lincoln in their first parade, he was inaugurated President of the United States.

* Compare THE CENTURY, Jan., 1887, p. 396.

† Lincoln to Edward Lusk, Oct. 30th, 1858. MS.

"Yours of the 20th is received. I suppose as good or even better men than I have been in American or Know-nothing lodges; but, in point of fact, I never was in one, at Quincy or elsewhere. . . . And now a word of caution. Our adversaries think they can gain a point if they can force me to openly deny the charge, by which some degree of offense would be given to the Americans. For this reason it must not publicly appear that I am paying any attention to the charge." *

His position on the main question involved was already sufficiently understood; for in his elsewhere quoted letter of May 17th, 1859, he had declared himself against the adoption by Illinois, or any other place where he had a right to oppose it, of the recent Massachusetts constitutional provision restricting foreign-born citizens in the right of suffrage. It is well to repeat the broad philosophical principle which guided him to this conclusion: "Understanding the spirit of our institutions to aim at the elevation of men, I am opposed to whatever tends to degrade them." †

As the campaign progressed the chances of the result underwent an important fluctuation, involving some degree of uncertainty. The Democratic disruption, and the presence of four tickets in the field, rendered it possible that some very narrow plurality in one or more of the States might turn the scale of victory. Calculating politicians, especially those belonging to the party hitherto in power, and who had enjoyed the benefits of its extensive Federal patronage, seized eagerly upon this possibility as a means of prolonging their official tenure, and showed themselves not unwilling to sacrifice the principles of the general contest to the mere material and local advantage which success would bring them.

Accordingly, in several States, and more notably in the great State of New York, there was begun a quiet but unremitting effort to bring about a coalition or "fusion," as it was termed, of the warring Democratic factions, on the basis of a division of the spoils which such a combination was hoped to be able to secure. Nor did the efforts stop there. If the union of the two factions created the probability, the union of three seemed to insure certainty, and the negotiations for a coalition, therefore, extended to the adherents of Bell and Everett. Amid the sharp contest of ideas and principles which divided the coun-

try, such an arrangement was by no means easy; yet in a large voting population there is always a percentage of party followers on whom the obligations of party creeds sit lightly. Gradually, from talk of individuals and speculations of newspapers, the intrigue proceeded to a coquetting between rival conventions; where the formal proceedings encountering too much protest and indignation, the scheme was handed over to standing committees, who could deliberate and bargain in secret. It must be stated to the credit of Douglas, that he publicly rejected any alliance not based on his hobby of "non-intervention"; ‡ but the committees and managers cared little for the disavowal. In due time they perfected their agreement that the New York electoral ticket (numbering 35) should be made up of adherents of the three different factions in the following proportion: Douglas, 18; Bell, 10; Breckinridge, 7.§ This agreement was carried out, and the fusion ticket thus constituted was voted for at the presidential election by the combined opponents of Lincoln.

In Pennsylvania, notwithstanding that Douglas disfavored the scheme, an agreement or movement of fusion also took place; but in this case it did not become complete, and was not altogether carried out by the parties to it, as in New York. The electoral ticket had been nominated by the usual Democratic State convention (March 1st) prior to the Charleston disruption, and, as it turned out, about one-third of these nominees were favorable to Douglas. After the disruption, the Douglasites also formed a straight, or Douglas, electoral ticket. In order to unite the two wings at the October State election, the Executive Committee of the original convention recommended (July 2d) that the electors first nominated should vote for Douglas if his election were possible; if not, should vote for Breckinridge. A subsequent resolution (August 9th) recommended that the electors should vote for either Douglas or Breckinridge, as the preponderance of Douglas or Breckinridge votes in the State might indicate. On some implied agreement of this character, not clearly defined or made public, the Douglas, Breckinridge, and Bell factions voted together for governor in October. Being beaten by a considerable majority at that election, the impulse to fusion was

* Lincoln to Hon. A. Jonas, July 21st, 1860. MS.

† Lincoln to Dr. Theodore Canisius, May 17th, 1859.

‡ "I will give you my opinion as to fusion. I think that every man [*sic*] who believes that slavery ought to be banished from the halls of Congress, and remanded to the people of the Territories subject to the Constitution, ought to fuse and act together; but that no Democrat can, without dishonor, and forfeiture of self-respect and principle, fuse with anybody who is in favor of intervention, either for slavery or against slavery. Lincoln

and Breckinridge might fuse, for they agree in principle. I can never fuse with either of them, because I differ from both. I am in favor of all men acting together who are opposed to this slavery agitation, and in favor of banishing it from Congress forever; but as Democrats we can never fuse, either with Northern abolitionists, or Southern bolters and secessionists."—Douglas, speech at Erie, Penn., "N. Y. Tribune," October 3d, 1860, p. 4.

§ Greeley, "American Conflict," Vol. I., p. 324.

greatly weakened. Finally the original Democratic State Committee rescinded (October 12th) all its resolutions of fusion, and the Douglas State Committee withdrew (October 18th) its straight Douglas ticket. This action left in the field the original electoral ticket nominated by the Democratic State convention at Reading prior to the Charleston Convention, untrammelled by any instructions or agreements. It was nevertheless a fusion ticket in part, because nine of the candidates (one-third of the whole number) were pledged to Douglas. What share or promise the Bell faction had in it was not made public. At the presidential election it was voted for by a large number of fusionists; but a portion of the Douglasites voted straight for Douglas, and a portion of the Bell men straight for Bell.*

In New Jersey also a definite fusion agreement was reached between the Bell, Breckinridge, and Douglas factions. An electoral ticket was formed, composed of 2 adherents of Bell, 2 of Breckinridge, and 3 of Douglas.† This was the only State in which the fusion movement produced any result in the election. It turned out that a considerable fraction of the Douglas voters refused to be transferred by the agreement which their local managers had entered into. They would not vote for the two Bell men and the two Breckinridge men on the fusion ticket, but ran a straight Douglas ticket, adopting the three electors on the fusion ticket.‡ By this turn of the canvass the 3 Douglas electors whose names were on both tickets were chosen, but the remainder of the fusion ticket was defeated, giving Lincoln 4 electoral votes out of the 7 in New Jersey. Some slight efforts towards fusion were made in two or three other States, but accomplished nothing worthy of note, and would have had no influence on the result, even had it been consummated.

All these efforts to avert or postpone the great political change which was impending were of no avail. In the long six years' agitation popular intelligence had ripened to conviction and determination. Every voter substantially understood the several phases of the great slavery issue, its abstract morality, its economic influence on society, the intrigue of the Administration and the Senate to make Kansas a slave State, the judicial status of slavery as expounded in the Dred Scott decision, the validity and the effect of the fugitive-slave law, the question of the balance of political power as involved in the choice between slavery extension and slavery restric-

tion,—and reaching beyond even this, the issue so clearly presented by Lincoln whether the States ultimately should become all slave or all free. In the whole history of American politics the voters of the United States never pronounced a more deliberate judgment than that which they recorded upon these grave questions at the presidential election in November, 1860.

From much doubt and uncertainty at its beginning, the campaign swept onward through the summer months, first to a probability, then to an assurance of Republican success. In September the State of Maine elected a Republican governor by 18,000 majority. In October the pivotal States gave decisive Republican majorities: Pennsylvania 32,000 for governor, Indiana nearly 10,000 for governor, and Ohio 12,000 for State ticket and 27,000 on congressmen. Politicians generally conceded that the vote in these States clearly foreshadowed Lincoln's election. The prophecy not only proved correct, but the tide of popular conviction and enthusiasm, rising still higher, carried to his support other States which were yet considered uncertain.

The presidential election occurred on November 6th, 1860. In seventeen of the free States—namely, Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, Vermont, New York, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, California, and Oregon—all the Lincoln electors were chosen. In one of the free States (New Jersey) the choice resulted in 4 electors for Lincoln and 3 for Douglas, as already explained. This assured Lincoln of the votes of 180 presidential electors, or a majority of 57 in the whole electoral college. The 15 slave States were divided between the other 3 candidates. Eleven of them—Alabama, Arkansas, Delaware, Florida, Georgia, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, and Texas—chose Breckinridge electors, 72 in all. Three of them—Kentucky, Tennessee, and Virginia—chose Bell electors, 39 in all; and one of them—Missouri—Douglas electors, 9 in number, which, together with the 3 he received in the free State of New Jersey, gave him 12 in all; the aggregate of all the electors opposed to Lincoln being 123.

The will of the people as expressed in this popular vote was in due time carried into execution. As the law prescribes, the presidential electors met in their several States on the 5th of December, and cast their official votes according to the above enumeration. And on

* The vote in Pennsylvania stood: Lincoln, 268,030; Breckinridge nominally, 178,871; Douglas, 10,705; Bell, 12,776.

† Greeley, "American Conflict," Vol. I., p. 328.

‡ Greeley, "American Conflict," Vol. I., p. 328.

the 13th of February, 1861, the Congress of the United States in joint session made the official count, and declared that Abraham Lincoln, having received a majority of the votes of presidential electors, was duly elected President of the United States for four years, beginning March 4th, 1861.

One feature of the result must not be omitted. Many careless observers felt at the time that the success of Lincoln was due entirely to the fact of there having been three opposing candidates in the field; or, in other words, to the dissensions in the Democratic party, which divided its vote between Breckinridge and Douglas. What merely moral strength the Democratic party would have gained had it remained united, it is impossible to estimate. Such a supposition can only be based on the absence of the extreme Southern doctrines concerning slavery. Given the presence of those doctrines in the canvass, and no hypothesis can furnish a result different from that which occurred. In the contest upon the questions as they existed, the victory of Lincoln was certain. If all the votes given to all the opposing candidates had been concentrated and cast for a "fusion ticket," as was wholly or partly done in five States, the result would have been changed nowhere except in New Jersey, California, and Oregon; Lincoln would still have received but 11 less, or 169 electoral votes — a majority of 35 in the entire electoral college. It was a contest of ideas, not of persons or parties. The choice was not only free, but distinct and definite. The voter was not, as sometimes happens, compelled to an imperfect or partial expression of his will. The four platforms and candidates offered him an unusual variety of modes of political action. Among them the voters by undisputed constitutional majorities, in orderly, legal, and unquestioned proceedings, chose the candidate whose platform pronounced the positive and final popular verdict that slavery should not be extended, and whose election unchangeably transferred the balance of power to the free States.

BEGINNINGS OF REBELLION.

DISUNION was not a fungus of recent growth in American politics. Talk of disunion, threats of disunion, accusations of intentions of disunion, lie scattered rather plentifully through the political literature of the country from the very formation of the Government. In fact, the present Constitution of the United States was strenuously opposed by large political factions, and, it may almost be said, succeeded by only a hair's-breadth. That original opposition perpetuated itself in some degree in the form of doubts of its duration and prophecies

of its failure. The same dissatisfaction and restlessness resulted in early and important amendments, but these did not satisfy all dissenters and doubters. Immediate and profound conflict of opinion sprang up over the administration and policy of the new Government; active political parties and hot discussion arose, the one side proclaiming that it was too strong, the other asserting that it was too weak, to endure.

Before public opinion was well consolidated, the war of 1812 produced new complaints and new opposition, out of which grew the famous Hartford Convention. It has been charged and denied, that this was a movement of disunion and rebellion. The exact fact is not important in our day; it is enough that it was a sign of deep political unrest and of shallow public faith. Passing by lesser manifestations of the same character, we come to the eventful nullification proceedings in South Carolina in the year 1832. Here was a formal legislative repudiation of Federal authority with a reserved threat of forcible resistance. At this point disunion was in full flower, and the terms nullification, secession, treason, rebellion, revolution, coercion, constitute the current political vocabulary. Take up a political speech of that period, change the names and dates, and the reader can easily imagine himself among the angry controversies of the winter of 1860.

Nullification was half-throttled by Jackson's proclamation, half-quieted by Clay's compromise. But from that time forward the phraseology and the spirit of disunion became a constant factor in congressional debate and legislation. In 1850, it broke out to an extent and with an intensity never before reached. This time it enveloped the whole country, and many of the wisest and best statesmen believed civil war at hand. The compromise measures of 1850 finally subdued the storm; but not till the serious beginning of a secession movement had been developed and put down, both by the general condemnation of the whole country, and the direct vote of a union majority in the localities where it took its rise.

Among these compromise acts of 1850 was the admission of California as a free State. The gold discoveries had suddenly filled it with population, making the usual probation as a Territory altogether needless. A considerable part of the State lay south of the line of 36°, 30', and the pro-slavery extremists had demanded that it should be divided into two States — one to be a free, and the other to be a slave State — in order to preserve the political balance between the sections, in the United States Senate. This being refused, they not only violently opposed the compromise measures, but organized

a movement for resistance in South Carolina, Georgia, and Mississippi, demanding redress, and threatening secession if it were not accorded. A popular contest on this issue followed in 1851 in these States, in which the ultra-secession party was signally overthrown. It submitted sullenly to its defeat; leaving however, as always before, a considerable faction unsatisfied and implacable, only awaiting a new opportunity to start a new disturbance. This new opportunity arose in the slavery agitation, beginning with the repeal of the Missouri Compromise in 1854, and ending with the election of Lincoln. During this six years' controversy, disunion was kept in the background because the pro-slavery party had constant and sanguine hopes of ultimate triumph. It did not despair of success until the actual election of Lincoln, on the 6th of November, 1860; consequently, even in the Southern States, as a rule, disunion was frowned upon till near the end of the presidential campaign, and only paraded as an evil to be feared, not to be desired.

This aspect, however, was superficial. Under the surface, a small but determined disunion conspiracy was actively at work. It has left but few historical traces; but in 1856 distinct evidence begins to crop out. There was a possibility, though not a probability, that Frémont might be elected President; and this contingency the conspirators proposed to utilize by beginning a rebellion. A letter from the governor of Virginia to the governors of Maryland and other States is sufficient proof of such an intent, even without the evidence of later history.

"RICHMOND, VA., Sept. 15th, 1856.

"DEAR SIR: Events are approaching which address themselves to your responsibilities and to mine as chief Executives of slave-holding States. Contingencies may soon happen which would require preparation for the worst of evils to the people. Ought we not to admonish ourselves by joint counsel of the extraordinary duties which may devolve upon us from the dangers which so palpably threaten our common peace and safety? When, how, or to what extent may we act, separately or unitedly, to ward off dangers if we can, to meet them most effectually if we must?"

"I propose that, as early as convenient, the governors of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Texas, Arkansas, Mississippi, and Tennessee shall assemble at Raleigh, N. C., for the purpose generally of consultation upon the state of the country, upon the best means of preserving its peace, and especially of protecting the honor and interests of the slave-holding States. I have addressed the States only having Democratic Executives, for obvious reasons.

"This should be done as early as possible before the presidential election, and I would suggest Monday, the 13th of October next. Will you please give me an early answer, and oblige,

"Yours most truly and respectfully,

"HENRY A. WISE.

"His Excellency Thomas W. Ligon,

"Governor of Maryland."

If any explanation were needed of the evident purpose of this letter, or of the proposed meeting, it may be found in the following from Senator Mason, of Virginia, to Jefferson Davis, of Mississippi, who was at the time Secretary of War under President Pierce:

"SELMA, NEAR WINCHESTER, VA.,

"Sept. 30th, 1856.

"MY DEAR SIR: I have a letter from Wise, of the 27th, full of spirit. He says the governors of North Carolina, South Carolina, and Louisiana have already agreed to rendezvous at Raleigh, and others will—this in your most private ear. He says, further, that he had officially requested you to exchange with Virginia, on fair terms of difference, percussion for flint muskets. I don't know the usage or power of the department in such cases, but if it can be done, even by liberal construction, I hope you will accede. Was there not an appropriation at the last session for converting flint into percussion arms? If so, would it not furnish good reason for extending such facilities to the States? Virginia probably has more arms than the other Southern States, and would divide, in case of need. In a letter yesterday to a committee in South Carolina, I give it as my judgment, in the event of Frémont's election, the South should not pause, but proceed at once to 'immediate, absolute, and eternal separation.' So I am a candidate for the first halter.

"Wise says his accounts from Philadelphia are cheering for Old Buck in Pennsylvania. I hope they be not delusive. *Vale et Salute* [sic].

"J. M. MASON.

"Colonel Davis." "

In these letters we have an exact counterpart of the later and successful efforts of these identical conspirators conjointly with others, to initiate rebellion. When the Senatorial campaign of 1858 between Lincoln and Douglas was at its height, there was printed in the public journals of the Southern States the following extraordinary letter, which at once challenged the attention of the whole reading public of the country, and became known by the universal stigma of "The Scarlet Letter." In the light of after events it was both a revelation and a prophecy:

"MONTGOMERY, June 15th, 1858.

"DEAR SIR: Your kind favor of the 15th is received. I heartily agree with you that [no] general movement can be made that will clean out the Augean stable. If the Democracy were overthrown, it would result in giving place to a greater and hungrier swarm of flies.

"The remedy of the South is not in such a process. It is in a diligent organization of her true men for prompt resistance to the next aggression. It must come in the nature of things. No national party can save us; no sectional party can ever do it. But if we could do as our fathers did—organize 'committees of safety' all over the Cotton States (it is only in them that we can hope for any effective movement)—we shall fire the Southern heart, instruct the Southern mind, give courage to each other, and at the proper moment, by one organized concerted action, we can precipitate the Cotton States into a revolution.

"The idea has been shadowed forth in the South by Mr. Ruffin; has been taken up and recommended in the 'Advertiser' (published at Montgomery, Alabama), under the name of 'League of United Southern-

"Victor, 'American Conspiracies,' p. 520.

ers,' who, keeping up their old party relations on all other questions, will hold the Southern issue paramount, and will influence parties, legislatures, and statesmen. I have no time to enlarge, but to suggest merely. In haste, yours, etc.,

"WM. L. YANCEY.

"To James Slaughter, Esq."*

The writer of this "Scarlet Letter" had long been known to the country as a prominent politician of Alabama, affiliated with the Democratic party, having once represented a district of that State in Congress, and of late years the most active, pronounced, and conspicuous disunionist in the South. In so far as this publication concerned himself, it was no surprise to the public; but the project of an organized conspiracy had never before been broached with such matter-of-fact confidence.†

* Quoted in Appendix to Globe for 1859-60, p. 313.

† As an evidence of the disunion sentiment combination which lay like smoldering embers under the surface of Southern politics, it is instructive to read a hitherto unpublished letter from Governor Henry A. Wise, of Virginia, to a gentleman in Philadelphia, for a copy of which we are indebted to General Duncan S. Walker. The other letter of Wise — previously quoted, — shows us his part and interest in the proposed conspiracy against Frémont; but the erratic governor had, after the lapse of nearly two years, become an anti-Lecompton-Douglasite, and was ready to give confidential warning of designs with which he was only too familiar. As this was written nearly three weeks before Yancey's "Scarlet Letter," its concurrent testimony is of special significance:

"RICHMOND, VA., May 28th, 1858.

"TO WM. SERGEANT, ESQ.

"MY DEAR SIR: I write to you almost from a sick-bed. I am just up out of a two weeks' bedridden illness, and am very weak. Mr. Forney's letter does not surprise me, for the suggestions and queries are natural and necessary, and to me not at all offensive or disagreeable. Yet I would not go before the public at this time with such a correspondence as it calls for. The present aspect of politics is gloomy enough. It is well to define what it is. The *Kansas* question has not been the cause of a split in the Democratic party. It has only been the pretext for a development of dissension which previously existed. The truth is that there is in the South an organized, active, and dangerous faction, embracing most of the Federal politicians, who are bent upon bringing about causes of a dissolution of the Union. They desire a united South, but not a united country. Their hope of embodying a sectional antagonism is to secure a sectional defeat. At heart, they do not wish the Democracy to be any longer national, united, or successful. In the name of Democracy they propose to make a nomination for 1860, at Charleston; but an ultra nomination of an extremist; on the slavery issue alone; to unite the South on that one idea; and on that to have it defeated by a line of sectionalism which will inevitably draw swords between fanatics on one side and fire-eaters on the other. Bear it in mind, then, that they desire to control a nomination for no other purpose than to have it defeated by a line of sections. They desire defeat, for no other end than to make a pretext for the clamor of dissolution. This must be borne in mind in order to understand why it is that the argument of splitting the Democracy has not only no weight with them for desisting from their madness, but is the very stimulus which pricks them on to the extreme of designed defeat, so it be purely

An almost universal condemnation by the public press reassured the startled country that the author of this revolutionary epistle was one of the confirmed fanatics who were known and admitted to exist in the South, but whose numbers, it was alleged, were too insignificant to excite the most distant apprehension.

The letter was everywhere copied, its author denounced, and his proposal to "precipitate the Cotton States into a revolution" held up to public execration. Mr. Yancey immediately printed a statement deploring the betrayal of personal confidence in the publication, and to modify ‡ the obnoxious declaration by a long and labored argument. But in the course of this explanation he furnished additional proof of the deep conspiracy disclosed by the "Scar-

sectional. This you see is their only hope. What will be their scheme of action? To pack the Charleston Convention with fire-eating disunionists from the South, and with Lecompton Democrats of the North — to nominate a Southern Lecomptonite, purposely to be defeated by a sectional vote! The Administration don't or won't see this, and an Administration organization cannot prevent it, perhaps, if it did or would see it. What then? The only hope is in the anti-Lecomptonite Democrats, North and South. I have no doubt we can beat them on the Lecompton issue in Virginia, North Carolina, Kentucky, Tennessee, Arkansas, and Maryland. The Lecomptonites have in fact the pap-fed office-holders alone in the free States North and West, but they will send their whole force and ten times more to Charleston. What have our friends to do, then? Why, to adhere to the national Democracy, the Union-saving Democracy, to save Democracy itself from maladministration. We must claim our identity, and never let go the party. We must organize, and send all our forces to Charleston. The consequence will probably be that every Northern, Western, and Middle State will be split. They will be divided, and, like New York in the Cincinnati Convention, be neutralized and count nothing. Or the Lecomptonites will be counted entirely out. In either event, a minority, a combined Southern and office-holding minority, will nominate at Charleston. It will then be time enough for the anti-Lecomptonite Democrats to decide not to abide by a nomination so made. What, then, if they do not? Why, they may return to their respective States, appeal to the people who still abide a national platform, and still desire to preserve the Union, and, in their respective States, make their own nominations. This may save the North from absorption by black-Republicanism, may throw the election into the House of Representatives, and save the Union. I see no other course. The word now should be silent, quiet, active organization, with a preconcerted understanding as to ultimate action. Let us be earnestly conservative; maintain party relations until forced to separate action, and when forced, be prepared to save and not destroy the country and the party.

"This is crude, I know, but you may fill the skeleton with muscle and nerve. Show this to Mr. Forney as my general view, and beg him not to publish it at this time at all events.

"All are well except myself. Love to all.

"Yours truly, HENRY A. WISE." MS.

‡ "I am a secessionist and not a revolutionist, and would not 'precipitate' but carefully prepare to meet an inevitable dissolution." — Yancey to Pryor. "Richmond South," copied in "National Intelligencer," Sept. 4th, 1858.

let Letter." He made mention of "A well-considered Southern policy, a policy which has been digested, and understood, and approved by the ablest men in Virginia, as you yourselves must be aware," to the effect that while the Cotton States began rebellion, "Virginia and the other border States should remain in the Union," where, by their position and their counsels, they would form a protecting barrier to the proposed separation. "In the event of the movement being successful," he continued, "in time Virginia and the other border States that desired it could join the Southern Confederacy."

Less uncertainty than ordinary hung over the final issue of the presidential campaign of 1860. To popular apprehension the election of Lincoln became more and more probable. The active competition for votes by four presidential tickets greatly increased his chances of success; and the verdict of the October elections appeared to all sagacious politicians to render his choice a practical certainty. Sanguine partisans, however, clung tenaciously to their favorites, and continued to hope against hope, and work against fate. This circumstance produced a deplorable result in the South. Under the shadow of impending defeat the Democrats of the Cotton States made the final months of the canvass quite as much a threat against Lincoln as a plea for Breckinridge. This preaching of secession seemed to shallow minds harmless election buncombe; but when the contingency finally arrived, and the choice of Lincoln became a real event, they found themselves already in a measure pledged to resistance. They had vowed they would never submit; and now, with many, the mere pride of consistency moved them to adhere to an ill-considered declaration. The sting of defeat intensified their resentment, and in this irritated frame of mind the secession demagogues among them lured them on skillfully into the rising tide of revolution.

In proportion to her numbers, the State of South Carolina furnished the largest contingent to the faction of active conspirators; and to her, by a common consent, were accorded the dangers and honors of leadership. Since conspiracies work in secret, only fragmentary

proofs of their efforts ever come to light. Though probably only one of the many early agencies in organizing the rebellion, the following circular reveals in a startling light what labor and system were employed to "fire the Southern heart" after the November election:

"CHARLESTON, Nov. 10th, 1860.

"EXECUTIVE CHAMBER, 'The 1860 Association.'

"In September last, several gentlemen of Charleston met to confer in reference to the position of the South in the event of the accession of Mr. Lincoln and the Republican party to power. This informal meeting was the origin of the organization known in this community as 'The 1860 Association.'

"The objects of the Association are:

"*First.* To conduct a correspondence with leading men in the South, and by an interchange of information and views prepare the slave States to meet the impending crisis.

"*Second.* To prepare, print, and distribute in the slave States, tracts, pamphlets, etc., designed to awaken them to a conviction of their danger, and to urge the necessity of resisting Northern and Federal aggression.

"*Third.* To inquire into the defenses of the State, and to collect and arrange information which may aid the Legislature to establish promptly an effective military organization.

"To effect these objects a brief and simple Constitution was adopted, creating a President, a Secretary, and Treasurer, and an Executive Committee, specially charged with conducting the business of the Association. One hundred and sixty-six thousand pamphlets have been published, and demands for further supplies are received from every quarter. The Association is now passing several of them through a second and third edition.

"The conventions in several of the Southern States will soon be elected. The North is preparing to soothe and conciliate the South by disclaimers and overtures. The success of this policy would be disastrous to the cause of Southern Union and Independence, and it is necessary to resist and defeat it. The Association is preparing pamphlets with this special object. Funds are necessary to enable it to act promptly. 'The 1860 Association' is laboring for the South, and asks your aid.

"I am, very respectfully, your obedient servant,

"ROBERT N. GOURDIN,

"Chairman of the Executive Committee." *

The half-public endeavors of "The 1860 Association" to create public sentiment were vigorously seconded by the efforts of high official personages to set on foot concerted official action in aid of disunion. In this also, with becoming expressions of modesty, South Carolina took the initiative. On the 5th of October, Governor Gist wrote a confidential letter,† which he dispatched by a secret

which is so essential to success. Although I will consider your communication confidential, and wish you so to consider mine so far as publishing in the newspapers is concerned, yet the information of course will be of no service to me unless I can submit it to reliable and leading men in consultation for the safety of our State and the South; and will only use it in this way. It is the desire of South Carolina that some other State should take the lead, or at least move simultaneously with her. She will unquestionably call a convention as soon as it is ascertained that a majority of the electors will support Lincoln. If a single State secedes, she will follow her. If no other State takes the lead, South

agent to his colleagues, the several governors of the Cotton States, whom the bearer, General S. R. Gist, visited in turn during that month of October. Governor Gist wrote that, in view of the almost certain election of Lincoln, it became important to have a full and free interchange of opinion between the Southern States, that concert of action might be obtained. It was the desire of South Carolina that some other State should take the lead. She would unquestionably call a convention. "If a single State secedes, she will follow her. If no other State takes the lead, South Carolina will secede (in my opinion) alone, if she has any assurance that she will be soon followed by another or other States; otherwise it is doubtful."

Carolina will secede (in my opinion) alone, if she has any assurance that she will be soon followed by another or other States; otherwise it is doubtful. If you decide to call a convention upon the election of a majority of Electors favorable to Lincoln, I desire to know the day you propose for the meeting, that we may call our convention to meet the same day if possible. If your State will propose any other remedy, please inform me what it will probably be, and any other information you will be pleased to give me.

"With great respect and consideration,

"I am yours, etc., WM. H. GIST.

"Governor Thos. O. Moore." MS.

"EXECUTIVE DEPARTMENT,

"RALEIGH, N. C., Oct. 18th, 1860.

"DEAR SIR: I have the honor to acknowledge the receipt of your favor of the 5th, which reached me on the 12th inst.

"In compliance with your request, I will give as accurately as it is in my power to do the views and feelings of the people of North Carolina upon the important subject of your communication.

"Political differences and party strife have run so high in this State for some years past, and particularly during the past nine months, that anything like unanimity upon any question of a public nature could scarcely be expected; and such is the case with the one under consideration. Our people are very far from being agreed as to what action the State should take in the event of Lincoln's election to the Presidency. Some favor submission, some resistance, and others still would await the course of events that might follow. Many argue that he would be powerless for evil with a minority party in the Senate, and perhaps in the House of Representatives also; while others say, and doubtless with entire sincerity, that the placing of the power of the Federal Government into his hands would prove a fatal blow to the institution of negro slavery in this country.

"None of our public speakers I believe have taken the ground before the people that the election of Lincoln would, of itself, be a cause of secession. Many have said it would not, while others have spoken equivocally.

"Upon the whole I am decidedly of opinion that a majority of our people would not consider the occurrence of the event referred to as sufficient ground for dissolving the union of the States. For which reason I do not suppose that our Legislature, which will meet on the 19th prox., will take any steps in that direction—such for instance as the calling of a convention.

"Thus, sir, I have given you what I conceive to be the sentiment of our people upon the subject of your

The responses to this inquiry given by the Executives of the other Cotton States were not all that so ardent a disunionist could have wished, but were yet sufficient to prompt him to a further advance. The adjoining State of North Carolina was first to reply.* "Our people are very far from being agreed as to what action the State should take," wrote Governor Ellis; "some favor submission, some resistance." He intimated that no convention would be called, and that the State would not secede, but on the other hand added, "I do not think North Carolina would become a party to coercion." Louisiana sent an equally lukewarm answer.† Governor Moore said, while he believed in the right of secession for just cause, he would not advise it, and did not

letter, and I give it as an existing fact, without comment as to whether the majority be in error or not.

"My own opinions, as an individual, are of little moment. It will be sufficient to say, that as a States Rights man, believing in the sovereignty and reserved powers of the States, I will conform my actions to the action of North Carolina, whatever that may be. To this general observation I will make but a single qualification—it is this: I could not in any event assent to, or give my aid to a political enforcement of the monstrous doctrine of coercion. I do not for a moment think that North Carolina would become a party to the enforcement of this doctrine, and will not therefore do her the injustice of placing her in that position, even though hypothetically.

"With much respect, I have the honor to be,

"Your obt. servt.,

"JOHN W. ELLIS.

"His Excellency William H. Gist,

"Governor of So. Carolina." MS.

† "ALEXANDRIA, LA., 26th October, 1860.

"HIS EXCELLENCY GOVERNOR GIST.

"DEAR SIR: Your favor of the 5th inst. was received a few days ago at this place. I regret my inability to consult with as many of our leading citizens as I wished, but I will not delay in replying any longer. You will [of course] consider my letter as private, except for use in consultation with friends.

"I shall not call a convention in this State if Lincoln is elected, because I have no power or authority to do so. I infer from your letter that an authority has been vested in you by your Legislature to call a convention in a specified contingency. Our Legislature has taken no action of that or any similar kind. That body will meet in regular annual session about the middle of January; but it is not improbable that I may consider it necessary to convene it at an earlier day, if the complexion of the Electoral Colleges shall indicate the election of Lincoln.

"Even if that deplorable event shall be the result of the coming election, I shall not advise the secession of my State, and I will add that I do not think the people of Louisiana will ultimately decide in favor of that course. I shall recommend that Louisiana meet her sister slave-holding States in council to consult as to the proper course to be pursued, and to endeavor to effect a complete harmony of action. I fear that this harmony of action, so desirable in so grave an emergency, cannot be effected. Some of the Cotton States will pursue a more radical policy than will be palatable to the border States, but this only increases the necessity of convening the consultative body of which I have spoken. I believe in the right of secession for

think the people of Louisiana would ultimately decide in favor of that course. The answer at Mississippi was a little more radical.* Governor Pettus replied that both politicians and people seemed willing to do anything to prevent that State from passing under the Black Republican yoke. He thought Mississippi would call a council of the Southern States, and if that council should advise secession,

just cause, of which the sovereignty must itself be the judge. If therefore the General Government shall attempt to coerce a State, and forcibly attempt the exercise of this right, I should certainly sustain the State in such a contest.

"There has never been any indication made by Louisiana, or by any public body within her limits, of her probable course in the event of an election of a Black President, and she is totally unprepared for any warlike measures. Her arsenals are empty. While some of her sister States have been preparing for an emergency, which I fear is now imminent, she has been negligent in this important matter.

"If coming events should render necessary the convocation of the Southern Convention, I shall endeavor to compose the representation of Louisiana of her ablest and most prudent men, if the power shall be vested in me to appoint them. However, I presume the Legislature will adopt some other course in the appointments. The recommendations of such a body assembled in such a crisis must necessarily carry great weight, and if subsequently ratified and adopted by each State by proper authority, will present the South in united and harmonious action.

"I have the honor to be your Excellency's obt. servt.,
"THOS. O. MOORE." MS.

* "MACON, Oct. 26th, 1860.

"HIS EXCELLENCY GOV. GIST.

"DEAR SIR: Your letter of Oct. 5th was handed me by General Gist. Having but few moments to reply, I write this more to acknowledge its receipt than to reply to its contents. Our friends in this State are willing to do anything they may have the power to do to prevent the State from passing under the Black Republican yoke. Our people know this, and seem to approve such sentiments, yet I do not believe Mississippi can move alone.

"I will call our Legislature in extra session as soon as it is known that the Black Republicans have carried the election. I expect Mississippi will ask a council of the Southern States, and if that council advise secession, Mississippi will go with them. If any State moves, I think Mississippi will go with her. I will write at length from Jackson.

"Yours respectfully,

"JOHN J. PETTUS." MS.

† "EXECUTIVE DEPARTMENT.

"MILLEDENTINE, GA., Oct. 31st, 1860.

"HIS EXCELLENCY W. H. GIST.

"DEAR SIR: I have the honor to acknowledge the receipt of your favor by the hand of General Gist, with whom I have had a free interchange of opinions. In the event of the election of Mr. Lincoln to the Presidency I have no doubt that Georgia will determine her action by a convention of the people, which will probably be held before the 4th day of March next. Her legislature, which convenes here next Wednesday, will have to determine on the time when the convention shall be held. My opinion is that the people of Georgia will, in case of the election of Lincoln, decide to meet all the Southern States in convention and take common action for the protection of the rights of all.

she would go with them. Mississippi would not move alone, but if any State moved, she would go with her. Georgia hung in a more uncertain balance.† Governor Brown answered he had no doubt Georgia would determine her action by a convention; that he favored retaliatory legislation, and thought the people would be inclined to wait for an overt act. Alabama, her governor replied,‡ did not con-

Events not yet foreseen may change their course and might lead to action on the part of Georgia without waiting for all the Southern States, if it should be found necessary to her safety. I have handed General Gist a copy of my message on our federal relations, which will be sent to our legislature on the first day of the session. I send only the forms from the press as it is just being put in type. I may make some immaterial alterations before it is completed. If your State remains in the Union, I should be pleased that she would adopt such retaliatory measures as I recommend in the message, or others which you may determine to be more appropriate. I think Georgia will pass retaliatory laws similar to those I recommend, should Lincoln be defeated. Should the question be submitted to the people of Georgia, whether they would go out of the Union on Lincoln's election without regard to the action of other States, my opinion is they would determine to wait for an overt act. The action of other States may greatly influence the action of the people of this State. This letter is not intended for publication in the newspapers, and has been very hastily prepared.

"I have the honor to be your Excellency's

"Obt. servt.,

"JOSEPH E. BROWN." MS.

‡ "EXECUTIVE DEPARTMENT,

"MONTGOMERY, ALA., Oct. 25th, 1860.

"HIS EXCELLENCY W. H. GIST.

"DEAR SIR: Your letter of the 5th inst. was handed me a few days since by General Gist. I fully concur with you in the opinion that Lincoln will be elected President, and that a full and free interchange of opinion between the Executives of the Southern States, and especially of the Cotton States, should be had as to what ought to be done and what will be done by them to protect the interest and honor of the slave-holding States in the event he should be elected.

"My opinion is, that the election of Lincoln alone is not sufficient cause for a dissolution of the Union; but that fact, when taken in connection with the avowed objects and intentions of the party whose candidate he is, and the overt acts already committed by that party in nullifying the fugitive-slave law, and the enactment of personal liberty bills in many of the non-slaveholding States, with other acts of like kind, is sufficient cause for dissolving every tie which binds the Southern States to the Union.

"It is my opinion that Alabama will not secede alone, but if two or more States will coöperate with her, she will secede with them; or if South Carolina or any other Southern State should go out alone and the Federal Government should attempt to use force against her, Alabama will immediately rally to her rescue.

"The opinions above expressed are predicated upon observation and consultation with a number of our most distinguished statesmen. The opinion thus expressed is not intended as a positive assurance, but is my best impression as to what will be the course of Alabama. Should Lincoln be elected, I shall certainly call a convention under the provisions of the resolutions of the last General Assembly of the State. The convention cannot be convened earlier than the first

sider the election of Lincoln in itself sufficient cause for disunion ; but, taken in connection with other objects and acts of the North, it was. In his opinion she would not secede alone, but would coöperate with two or more Southern States ; or would rally to the aid of South Carolina in resisting coercion. He intended calling a convention as soon as practicable. Florida, though the last to respond, was loudest in her eagerness to embark in the revolt.* Governor Perry wrote : " Florida is ready to wheel into line with the gallant Palmetto State, or any other Cotton State or States in any course which she or they may in their judgment think proper to adopt." He suggested that she might be unwilling to lead off, but would most assuredly coöperate or follow the lead of any single Cotton State.

Two agencies have thus far been described as engaged in the work of fomenting the rebellion : the first, secret societies of individuals, like " The 1860 Association," designed to ex-

Monday in February next, and I have fixed upon that day (in my own mind). The vote of the electors will be cast for President on the 5th day of December, after which it will require a few days to ascertain the result. Thirty days' notice will have to be given after the day upon which the delegates to the convention will be elected, and the convention is required to convene in two weeks after the election. This is not a matter of discretion with me, but is fixed by law. I regret that earlier action cannot be had, as it may be a matter of much importance that all the States that may determine to withdraw from the Union should act before the expiration of Mr. Buchanan's term of service.

" The facts and opinions herein communicated you are at liberty to make known to those with whom you may choose to confer, but they are not to be published in the newspapers.

" I have had a full and free conversation with General Gist, the substance of which is contained in this letter. He will, however, give it to you more in detail. It is my opinion that all the States that may determine to take action upon the election of Lincoln should call a convention as soon as practicable after the result is known. With great respect, your obt. servt.

" A. B. MOORE." MS.

* " EXECUTIVE DEPARTMENT, Nov. 9th, 1860.
" HIS EXCELLENCY GOV. GIST.

" DEAR SIR: Your communication of the 5th ultimo reached me per last mail under cover from General States Rights Gist, with an explanatory note from that gentleman in relation to the subject-matters thereof.

" The mode employed by your Excellency to collect authoritatively the views of several of the Executives of the Southern States as to their plan of action in the event of the election of Lincoln, commends itself

cite the masses and create public sentiment ; the second, a secret league of Southern governors and other State functionaries, whose mission it became to employ the governmental machinery of States, in furtherance of the plot. These, though formidable and dangerous, would probably have failed, either singly or combined, had they not been assisted by a third of still greater efficacy and certainty. This was nothing less than a conspiracy in the very bosom of the National Administration at Washington, embracing many United States Senators, Representatives in Congress, three members of the President's Cabinet, and numerous subordinate officials in the several Executive departments. The special work which this powerful central cabal undertook by common consent, and successfully accomplished, was to divert Federal arms and forts to the use of the rebellion, and to protect and shield the revolt from any adverse influence, or preventive or destructive action of the General Government.

warmly to my judgment. Concert of action can alone be arrived at by a full and free interchange of opinion between the Executives of the Cotton States, by whom it is confidently expected that the ball will be put in motion.

" We are in the midst of grave events, and I have industriously sought to learn the public mind in this State in the event of the election of Lincoln, and am proud to say Florida is ready to wheel into line with the gallant Palmetto State, or any other Cotton State or States in any course which she or they may in their judgment think proper to adopt, looking to the vindication and maintenance of the rights, interests, honor, and safety of the South. Florida may be unwilling to subject herself to the charge of temerity or immodesty by leading off, but will most assuredly coöperate with or follow the lead of any single Cotton State which may secede. Whatever doubts I may have entertained upon this subject have been entirely dissipated by the recent elections in this State.

" Florida will most unquestionably call a convention as soon as it is ascertained that a majority of the electors favor the election of Lincoln, to meet most likely upon a day to be suggested by some other State.

" I leave to-day for the capital, and will write you soon after my arrival, but would be pleased in the mean time to hear from you at your earliest convenience.

" If there is sufficient manliness at the South to strike for our rights, honor, and safety, in God's name let it be done before the inauguration of Lincoln.

" With high regard, I am yours, etc.,

" M. S. PERRY.

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XXXI.

THE sugar maples were yet in a glow of crimson; the hillsides were yet green; the sunshine was yet warm and cheering, when Mr. Stratford announced to Mrs. People

his intention of returning to his city home.

"It's a good deal earlier than you've ever gone yet," said she, "and I'm very sorry for it. But it's not to be wondered at, for you'd find it very lonely here with everybody away, and even Enoch himself gone out West, which is a thing he never did before, and which I hope won't end by his becomin' an emigrant, for I'm sure I don't want to go into any such wild country, or indeed into any country at all, except here, which I'm sure is a good enough place for anybody; and why Enoch shouldn't be satisfied to stay where he is, with everything comfortable around him, and crops as good as his neighbors', and plenty to eat and drink, I can't see for the life of me. If you knew the Stull fam'ly now, they might be some company for you; but then, ag'in, I don't s'pose you could git much out of 'em. Old Stull himself has gone back to town, and the two little girls have gone to school, but that Stull young woman and her mother are here ag'in, and, what's more, that Mr. Crisman, who Miss Armatt gave the sack to, is here too and courtin' Miss Matilda as if he was tryin' to ketch a train. Well, well," continued the good woman, corrugating her brow as the memory of broken schemes came to her, "things don't always turn out as they're wanted to, but I don't mind sayin' it to you, Mr. Stratford, that if I'd ever turned out to be that girl's mother-in-law, I couldn't have lived with her, which would have had its advantages in one way, for then I'd 'a' lived here, and not there, which would 'a' suited me better, for I don't want to leave Enoch, and if John had got the old place I'd been satisfied and asked no more; and, although Mrs. Stull is her own mother, the best I can wish for her is that she won't have to live with her, which, considerin' what kind of man he must be which Miss Gay and Mrs. Justin had to give his walkin' papers

to, won't be exactly what people mean when they talk about a heaven on earth."

When Stratford returned to New York, thoroughly convinced of Mr. Crisman's new attachment, his mind, instead of being in a state of certainty and decision, was in a condition of very great uncertainty, in regard to what he would do, and of very great indecision as to what he ought to do. Gay being free from Crisman, as she surely was, his appointed work was done; and what excuse could he make to himself for continuing that work? That dangerous space over which he had proposed to carry the young fellow-being in whom he had taken so great an interest had proved narrower than he had supposed it would be, and was already crossed. The vision of Arthur Thorne standing on the opposite bank proved this. Whatever might or might not happen to Gay from Thorne's love of her, the girl had no present need of Horace Stratford.

This was all clear and plain enough, and yet Stratford did not say to himself that his work being done he would step aside. "I will see her first," he thought, "and then I will decide upon my plan of action." The next morning after his arrival in the city, he went to Mrs. Justin's house. Gay had gone out, but Mrs. Justin was delighted to see him.

"I was afraid," she said, "that this fine weather would keep you in the country, and it is very encouraging to see you make your appearance so soon. And as for Gay, I am glad to say that her condition is improved. To be sure, she eats very little, she is easily tired, and she will not take medicines, but since she came to the city she is brighter and shows more interest in things. And I am quite sure," said Mrs. Justin, looking steadfastly at Stratford, "that your exchange of the pleasures of the shooting season for premature town life will have a beneficial effect upon her."

There was point to this remark, for Stratford was an earnest sportsman, and it had hitherto been his custom to invite some of his friends to Cherry Bridge during the shooting season.

"I shall be very glad," said he, "if in any way I can be of benefit to Miss Armatt."

"Don't be so cold and formal!" exclaimed the lady. "Why don't you look at the matter in a natural and sensible light? Gay has

missed you, and will be ever so glad to meet you again, and you know that I shall be more than glad to see you together again. Do you know why she is brighter and more cheerful than she was?"

"On account of the change to the city air, I suppose," he answered. "That is often of as much advantage as change to country air."

"It is nothing of the sort," said Mrs. Justin. "As soon as I decided that she was to come with me to town and not to make her expected visit to Maryland, she began to brighten. I know she wants to see her sister, but I also know that she wishes very much more to be with you, and if she had gone home she probably would have staid there until she began her post-collegiate course. But now that her health obliges her to be here with me, and, consequently, with you, her conscience is satisfied, and she is happier."

Stratford made no reply, but turned to a window and looked out.

"Of course you have heard," said Mrs. Justin, after a short silence, "that Mr. Crisman is paying attention to Miss Stull. I had the news from Mrs. People, who wrote to me about my winter supply of poultry, and inserted the item as a bit of flavoring. She says he is there every week."

"I have heard that," said Stratford.

"I must admit," continued the lady, "that when I received this news I was mortified that a man could so quickly turn from our Gay to Matilda Stull. And yet, upon thinking it over, I believe that we ought to feel rather satisfied than otherwise. Knowing as I do that Mr. Crisman is totally unworthy of Gay, I cannot but feel somewhat pleased that he has been able to compensate himself for any injury he may imagine he received at our hands."

Mrs. Justin arose, and stood beside Stratford. "Our old ships are now all behind us, and burned," she said, "and I pray for the most favoring winds to fill the new sails which shall bring Gay and you together. Now, don't say anything! That is one of the remarks to which no answer is required."

When Stratford called the next day he was received by Gay in the library, a room which Mrs. Justin now almost entirely surrendered to her young friend. The light from the high, wide window fell full upon the young girl as she arose, bright-eyed, to greet her visitor. When Gay reseated herself upon the soft-cushioned chair, the action showed a change in her which was instantly noticed by Stratford. The Gay Armatt of the old days at Cherry Bridge had never reclined. She was a girl who sat up straight, who moved quickly, whose presence suggested youthful vigor and activity.

Stratford drew a low chair near her and placed it so that he could face her as they talked. Whatever might be her present lack of strength or vitality, it had not affected her beauty. Never had she seemed so charming to the eyes of Stratford. Her morning dress of blue may have relieved the delicate color in her cheek, and brought out the pure whiteness of her neck and wrists, and the happy light in her eyes may have given something of its brightness to the smile upon her perfect lips, and even her unwonted languor may have infused new grace into that half-reclining figure; but, whatever were the reasons, Stratford now sat before a woman whose beauty fully satisfied him. He had always given due appreciation to Gay's personal attractions, but heretofore he had felt that there was something wanting, some little touch, he knew not what. That touch had now been given.

"Do you see this?" said Gay, holding up a book which had been lying open and face downward upon a little table at her side. "Perhaps you are not familiar with this style of literature. It is what is popularly called a novel."

"I am very familiar with novels," said Stratford, "and I have read that one."

"And I have read those," said Gay, pointing to a pile of books on the floor by the window, "and all of them in a little more than a week. I expected that by this time I should be working away in superheated mathematics and that sort of thing, but Mrs. Justin has put an interdict on study. I do scarcely anything but read novels and look at clothes. Whenever we go out we always go to shops, and, although we don't buy much, we have all sorts of things spread out and wonder how they would look made up. Mrs. Justin says that clothes cogitation is very restful to the mind."

"Does your mind need rest?" asked Stratford.

"I don't know," said Gay. "My body seems to need a good deal of it, and Mrs. Justin says I must show no favoritism; one must have just what the other gets. You see, I have given up thinking for myself; Mrs. Justin does that for me now."

"I did not suppose," said Stratford, "that you would ever allow any one to do your thinking for you."

"Oh, dear me!" exclaimed Gay, "you don't know how nice it is! You ought to try it. By the way," she added, with a quick start of animation, "will you let me do some thinking for you?"

"It will be something entirely novel to me," said Stratford, "and I should like it as a bit of experience."

"Well, then," said Gay, "please empty your mind of everything in it, and I will fill it for you. You are now thinking as follows: Here is a girl, or I should say a young woman, who is not feeling as much like an English sparrow as she did during the summer, but who is quite as well and quite as strong as a good many people who work or study or slave in all sorts of ways all day long, and a great part of the night besides. She has a friend, a dear friend, who is one of the noblest women on earth, and who is just as good and lovely as it is possible for any woman to be, but who has, in spite of all this, a blot upon her character. This is that she is too kind. It is a white blot, and a very beautiful one to look at, but still it is a blot, and it interferes with her ability to make the young person I am thinking of do what she ought to do. She lets this white blot spread itself over her sober judgment and several of her other good qualities, and she tells this young person that she must not do anything all day that is in the least bit like work or study. Now, I know this is all wrong. That girl would be a great deal happier, and it would be ever so much better for her in every way, if she were to shut up the novel she is reading, and stop short without knowing what happens next or how it ends, and apply herself to matters that are of importance and value; and if she takes up again those things which are the real object of her life she will become as much interested in them as she used to be, and will pay no attention to those little tired feelings which soon grow up into incurable laziness if one is not very careful. Now, I shall talk to that young person and make her see these things as I do. I don't think it will be at all difficult. I shall tell her that if she continues in her present indolent condition she will get rusty in the studies she has been working at this summer, and if she goes backward instead of keeping straight on, as I am sure her soul is longing to do, I really do not know what will become of her. I am quite certain she will take my advice, because she has the greatest confidence in my judgment. And indeed, considering how I have helped her and counseled her, and in all sorts of ways been of the greatest good and service to her, she must be horribly stupid if she don't know by this time that what I advise she ought to do. There is another reason, too, why I should advise her. If I sit and look at her reading novels and neglecting her duties and cultivating habits of laziness, and say nothing about it, I shall make her think that, though I must disapprove of what she is doing, I am keeping quiet merely because she is not quite well, and ought to be treated like a child or an in-

valid. Now, I know that this will grieve her very much, and so I shall speak out, and tell her that she ought to take up her work just where she put it down when she left Cherry Bridge, and I shall also tell her that when I can—that is to say, of course, not so often as I used to do in the country, but at times when it will not interfere with anything else I want to do—I will come and help her, and give her little hints about all sorts of things just as I did when we were in the country together. And now, sir," said Gay, who by this time was sitting up straight in her chair, her face slightly flushed and every trace of languor gone, "how do you like your train of thought?"

While Gay had been speaking, Stratford had sat gazing upon her. He had heard nearly all she had said, but some phrases here and there had escaped his attention because his mind was so busily at work for itself. "Do I love this beautiful girl?" he asked himself, as Gay's words gave to his mind a vision of one who extends her hands to a friend without intending or knowing that those outstretched arms may, instead, receive a lover.

As Stratford thus sat, thinking and listening, one of his arms hung over the side of his low chair, and as he unconsciously moved his hand his fingers touched a bow of ribbon on one of the folds of Gay's dress which lay upon the floor. Entirely unnoticed by her, he took an end of the ribbon between his thumb and finger and gently held and pressed it. This was on Gay; it was a part of her; it was a link between him and that beautiful creature flushing and warming before him. Through that bit of blue ribbon might pass an electric thrill which should change his being and make him blind to extended hands, seeing only outstretched arms.

He crumpled the ribbon in his fingers, his blood flowed quicker, and his eye grew brighter. "I could love her," he said to himself.

Gay went on talking. She was making him know now how much she depended on him, and how desirous she was for his society. She was sitting erect, and therefore nearer to him, but her eyes were fixed upon his face, and she knew not that he held her ribbon. "I could love her," he repeated to himself. Then his mind stopped, and began to work backward. "But if I do love her," he thought, "I shall never love myself again. I have sworn that I would do this thing, and that I would go through it without blame or blemish; and, to me, the purest love of this girl would be blame and blemish."

He dropped the ribbon from between his fingers, and placed his hand upon the arm of his chair.

"And now, sir," said Gay, "how do you like your train of thought?"

Stratford answered slowly. "I am not sure," he said, "but that it might be of advantage for you to take up your studies again; at least to a moderate extent. At any rate, as you so much desire it, it may be well to make the trial. Of course I shall be much pleased to drop in here from time to time and give you all the assistance that I can."

Then, after some inquiries in regard to Mrs. Justin, and some messages for her, he took leave of Gay, and went away with a cold face and a hot and troubled heart.

"My work is done," he said to himself. "Yes," he reasserted, as he clenched his fist, "it is done, done, done!"

When Mrs. Justin returned home, she disapproved entirely of what Gay told her Mr. Stratford had advised. Indeed she spoke a little petulantly about it. "I cannot imagine what he could have been thinking of," she said. "Instead of being well enough to study, you seem to me to be less able to endure any sort of work than you were some days ago. I shall allow no studying; you may be sure of that."

Gay was lying back in the library chair, her novel in her lap, open at the same pages which had been turned down on the table when Stratford had left her an hour before. "You mustn't find fault with Mr. Stratford," she said. "I advised him to advise me as he did, and I told him I hoped he would sometimes come and help me in the old way. He said he would, and I don't think he minded the trouble at all. I don't think he minded much, either way. He is always very good."

"Gay," said Mrs. Justin, "have you been talking a very great deal? Why do you close your eyes that way while you speak to me?"

"I don't know," said Gay. "I can't explain exactly how I feel. I am not hungry; I can't think of anything in particular that I care for. I have been trying to rouse myself up by thinking how I am wasting my time, but I don't believe I care just now whether I am wasting my time or not. I don't know exactly why, but this world seems to me an aimless sort of place."

Mrs. Justin gazed tenderly and kindly on the face of her young friend. "But it would be an easy matter, my dear," she said, "to make the world full of purpose."

"I suppose so," answered Gay, closing her eyes again as she languidly clasped her hands above her head.

XXXII.

VATOLDI'S was now enjoying what might be called a regenerated success. The total cessation of business during the alterations had given the public time to forget all about the boycotting troubles as well as the decadence of the establishment during the admin-

istration of Enoch Bullripple, while the great improvements now seen in the restaurant brought it not only its old customers but an abundance of new ones. The cooks, in their caps, baked, boiled, and broiled with enthusiasm and content; the waiters, in their jackets and aprons, gave solicitous attention to the desires of every comer; and John People stood behind his new desk, with his form as round, his carriage as upright, and his hair as smoothly brushed as of yore. But upon his brow there was more of cheerfulness and less of resignation. Some of this change arose from the fact that John was now a partner in the concern—a partner in a very small degree in fact, but still a partner; and it was not necessary to be so much resigned when what he did was partly for his own benefit. It is probable, although John would not have admitted it, that his increase of cheerfulness was due in a greater degree to his total loss of Matilda Stull. John's attachment to this young lady had been very wearing upon him. When hope lent him no assistance his progress was slow and painful, and when she gave him a helping hand she carried him along entirely too fast; he lost his breath, his legs became weak. It was well for him that he was stopped in time; now his breath was full and regular, his pace moderate, and his legs were strong.

There was a new refrigerator, and in one corner there frequently stood a plate containing a plump, fat, mutton-chop, a piece of tenderloin, or a choice veal-cutlet; seldom did it hold a sweet-bread or bit of dainty game, for Miss Burns was the owner of a vigorous appetite and a moderate purse. This young lady was now an habitual customer of Vatoldi's. There was something about the place which made a meal in any other restaurant extremely unsatisfactory to her; and if, for any reason, a day passed without her coming there, John was sure to drop in at the store and inquire about her health.

Miss Burns enjoyed more than the ordinary advantages of Vatoldi's, for John made it his business to see that her preference for that place was not detrimental to her fortune. From the amount due on the little bill which she presented to him he invariably deducted a certain percentage. To this the young lady frequently demurred and shook her head, but John, who had always something else to do, and who was not in the habit of talking much to customers at the desk, passed over her objections with a smile and gave his attention to the something else. Miss Burns would have demurred still more, had she known that John never failed to make up the deficit in her payments out of his own pocket. She ought to have supposed this, but young ladies who are

thinking of Johns do not always think of everything else.

The time came, however, when John felt that he must explain this financial method; and one evening, when the diners at Vatoldi's had all finished their meals, he called on Miss Burns at her boarding-house.

"I am sorry," said John, when he had explained the object of his visit, "that you ever thought it worth while to say anything about those little discounts, for the matter is really of no consequence at all. You see, I have a share in the business."

"Oh, yes," said Miss Burns, "I always supposed that."

"Yes," said John, "and people have thought I owned a good deal bigger part of it than is really the truth. But that's neither here nor there, and don't hurt anybody. Now it is to my interest to make the restaurant as pleasant a place as I can to everybody, and if I have any particular friend who finds it convenient to come there, I'm sure I ought to make it pleasant for her. And I leave it to yourself to say if it is not pleasanter to feel that you're partly taking lunch with a friend—not entirely, for perhaps you wouldn't do that, but partly—than to always sit down to an out-an-out bought meal?"

Miss Burns was crocheting an afghan. It was a good-sized one, big enough to cover a lounge which would be long enough for a gentleman to lie down upon. She got the wools at cost price from the store in which she was employed, and could, therefore, afford to make a nice large afghan. It had three plain dark green stripes, and two Roman stripes of bright and variegated colors. She was working on one of the Roman stripes now.

"That would be very nice," she said, "if one came to visit, but then you know I don't come to visit you."

John was about to ask, "Not even partly?" but, being a slow speaker, he had time to think that it would not do to intimate anything like that.

"And you know," continued Miss Burns, working a thread of dark blue into her stripe, "that it isn't right to have a gentleman regularly giving you things, especially your daily food; though, of course, you only do it partly; but that is what it comes to."

John passed his hand over his brow, and then turning his chair so as more directly to face Miss Burns, he put his right elbow upon the table at which they sat, and, intently gazing into her face as she spoke, he said: "I am sorry your mind is made up in such a way that you don't like to accept a little hospitality from a friend, not because of what it is, for it really amounts to nothing at all, but only

because it comes regular. But what would you say to a friend who would give you not only part of your lunch, but all of it? And not only your lunch, but your breakfast and dinner, and a supper too if you were inclined that way; and not only week days, but Sundays, and every day; and who would give you, besides, every frock you wore, your shoes, your bonnets, gloves, umbrellas, and trimmings, and everything needful from hair-pins to cloaks?"

As John spoke thus, Miss Burns's complexion, which was usually a little pallid, began to assume the hue of some pale pink wool which lay in her basket, but she did not speak, nor look up from her work, and John went on:

"And what would you say if, every time you wanted anything, whether it was to wear, or to eat, or to use in a house, or for sickness or health, or for journeys, or for friends in trouble, or for your own pleasures and joys and comforts, you went to this friend and you took them from him?"

Miss Burns's complexion had been gradually changing from the color of the pink wool to that of a ball of ashen gray hue which also lay in the basket. A sickening fear came over her that she might have mistaken the significance of John's words.

"Do you mean Providence?" she asked.

"No, me," said John.

The color of the brightest scarlet in Miss Burns's basket now flushed into her face. "That would be very nice," she presently said; and no Berlin wool could be softer than her tone.

JOHN PEOPLE was a straightforward man of business with a conscience, and when everything had been satisfactorily arranged between Miss Burns and himself, he deemed it his duty to inform his principal that he was going to be married. Seldom before had Mr. Stull been so thoroughly angry. John had been forgiven for the sins of his uncle and had been again taken into dignified favor, but the vile and treacherous action which he now proposed raised against him the wildest storm of Mr. Stull's indignation. What would a secret be worth—an overwhelmingly important secret—in the hands of a newly married man! With John as a bachelor—and Mr. Stull expected that his sense of honor and duty to his employer would keep him such—the secret was safe; but with a young wife secrecy might as well be blown to the winds and the bank president advertise in the daily papers that he was prepared to furnish the public with refreshments at his restaurant known as Vatoldi's. John's intentions might be honorable, but his wife would worm the secret out of him, and the world would soon know all. Better that John

should die than marry! Had Mr. Stull lived two hundred years before, he would have slain his manager on the spot.

This blow to Mr. Stull was aggravated by the fact that his mind was beginning to assume its normal condition of august tranquillity. All his branches of business were now proceeding to his entire satisfaction, and Enoch Bullripple, the only present thorn in his side, promised soon to become an insignificant prickle. The Western heirs of the Cherry Bridge farms had been informed of the nature of their claims, and Mr. Turby, who desired to act as their agent as well as Mr. Stull's, had written to them that there was every reason to believe that the matter could be settled with but little loss of time, and the sale of the property ordered for the benefit of the heirs. Mr. Stull's plans were all made. He would buy both farms, not in his own name, but in that of a Mineral Development Company which he would organize. In the course of time this purchase would probably prove a good investment. Enoch Bullripple would be ejected from the farm he now held, but, as he possessed Mr. Stull's secret, his subsequent treatment must be very prudently managed. Mr. Stull owned some Western lands, and he would sell Enoch Bullripple a small tract of these, securing himself by mortgage. He would then, if necessary, assist the old man to go out there and settle. The motive for this great generosity would be ascribed to Mr. Stull's interest in John People. With Enoch Bullripple out in Idaho, and under obligation, Mr. Stull would feel that he had punished the cunning villainy of the old farmer without endangering his secret.

But now John's announcement had banished every trace of august tranquillity. Mr. Stull's anger almost overcame him. Anathemas, reproaches, and denunciations crowded to his lips, but in the midst of his indignation he felt the necessity for prudence. Even so faithful a worm as John might turn.

"I shall say nothing to you now," he growled; "I will speak about this another time."

It would have been utterly impossible for Miss Matilda Stull to choose a more unsuitable moment than the evening of that day in which to announce to her father her engagement to Mr. Crisman. Mr. Stull was in the library of his spacious city mansion, a room furnished with everything that the library of a gentleman of wealth and culture should contain. The books on the shelves were most admirably selected, many of them being imported expressly for Mr. Stull, as he declined to introduce reprints into his library. The furniture was heavy and elegant. The walls, the floors, the windows, showed that the room had been furnished with thoughtful taste. Even

those things with which a gentleman solaces himself in the intervals of study were not forgotten: on a pair of stag's horns over the mantelpiece hung a number of handsome pipes, and an eastern jar filled with tobacco stood beneath them; through the glass doors of a buffet which stood in a corner could be seen decanters and glasses; and between two framed engravings of hunting-scenes hung a pair of fencing-foils and wire masks; while from a nickel-plated hook was suspended flat against the wall a large hammock of rare and beautiful workmanship which might be stretched to another nickel-plated hook in the opposite wall.

Yet in spite of all these appurtenances of elegant and comfortable studiousness, this was a room to be looked at, but not used. Mr. Stull was content to own his books; he did not care to read them, and the cases were always locked. He did not smoke, and the pipes on the stag's horns had never been used. He tasted wine or spirits only on rare occasions, and not a drop of their contents had ever been poured from the decanters in his buffet. He was not a fencer, and the foils and masks were fastened to the wall. He was a man who did not lounge, and the hammock on the hook was never stretched to the opposite wall. The room was furnished so as to appear as Mr. Stull thought a gentleman's library and study ought to appear, but he used no part of it except a small table under a gas-light, with a drawer in which he kept writing materials, and a leather-covered chair which always stood before it.

In this chair, and at this table, sat Mr. Stull when his daughter entered the room. Paper lay before him, and he had a pen in his hand, but he was not writing; he was savagely thinking, and endeavoring to form a plan of action in regard to John People. Miss Matilda saw that her father was in a very bad humor, and yet she did not hesitate in her purpose. She had not come to ask anything of her august parent; she had come to tell him something.

Mr. Stull looked up darkly, and encountered the somewhat petite but extremely well-formed features of Miss Matilda, upon which an expression of calm determination seemed to have been set and screwed. Without a preface, and with no sign of embarrassment, she briefly announced the fact that she and Mr. Charles Crisman, now in business in the mercantile house of Irkton, Perrysteer & Co., had made an engagement to marry each other.

Mr. Stull pushed back his chair with an imprecation which seldom fell from his dignified lips. "What do you mean?" he exclaimed.

"I mean exactly what I have said," answered his daughter Matilda.

Now rose J. Weatherby Stull in his wrath. In one day two persons, wholly dependent on him for everything they had in the world, had come to him and declared their intention of making unlawful marriages, for to him a marriage against his will was unlawful. To the first offender he had, as yet, said nothing or done nothing; but in this case, no caution, no prudence was necessary, and he launched upon his daughter the paternal thunder. He bade her never to mention to him again this stranger of whom she had spoken. He forbade her ever to speak to, or to write to, or even to think of, said stranger; and he ordered her to her room, there to remain until he had determined how she should be punished, and where she should be sent to be cured of this most unnatural, most disrespectful, and most atrocious folly.

Miss Stull declined to do any of these things.

Mr. Stull arose. "Do you wish me to take you by force to your room? Am I to be driven crazy by members of my family and by hirelings? Am I to hear twice a day that these dependents upon me intend, without my permission, and against my will, to marry?"

"Was the other one John People?" asked Miss Matilda.

Mr. Stull sat down as if he had been shot. "John People!" he gasped. "What is he to me?"

"He manages your restaurant," calmly replied his daughter, "and I have reason to believe that he wants to marry."

Mr. Stull sat and looked steadfastly at his daughter. Not a word did he speak, and it might almost be said not a thought did he think. His involuntary muscles and functions went on with their work, but every faculty, physical or mental, over which he ordinarily exercised volition was at a standstill. In only one way did he give any evidence of his ordinary reasoning powers. He presently turned to look towards the library door.

"Oh, that's all right," said Miss Matilda. "I shut it when I came in. I intended to speak of this restaurant business before long," she went on to say, "and I may as well do it now as at any other time, for it is a matter which concerns Mr. Crisman and myself as much as it does you. I began to suspect you had something to do with Vatoldi's when you used so often to urge mother and me to go there, and made a point of it especially on those days when you knew we were going shopping with the carriage. Mother never thought anything about it, but it struck me that you wouldn't take so much interest in a place of that sort if you didn't make something out of it. At first I supposed you had merely put some money into the concern, but I got into the habit of watching you when you were sitting

in your regular place at the upper end of the room where you could see everything, and if ever a man looked like the proprietor of an establishment, you looked like the proprietor of Vatoldi's. I remember one day that two young men came in and sat down with their hats on, and John People was so busy he didn't see them; but you looked at him just as you look at our two little girls in church, and the instant he caught your eye you told him, just as plainly as if you had spoken, to attend to those two men, which he immediately did. And then, when the strike began there, and the boycotting, and all that sort of thing, and I saw how you were troubled, that stamped and sealed the matter in my mind. I knew very well that you would never concern nor worry yourself so much about a business that didn't belong to you. Still I didn't know whether you were only a partner or sole proprietor, but when I saw John People up in the country this summer, I asked him if the restaurant belonged to one person or a firm, and he answered, 'One person,' and immediately changed the conversation. He had no idea what his words meant to me, but he might just as well have said, 'Your father is the proprietor.' I kept this little bit of knowledge entirely to myself, knowing it would come of use some day. I think it is the first really valuable possession I ever acquired entirely by my own exertions, and I am sure it comes in very well now. If you had not shown so much objection to my marriage with Mr. Crisman, I should not have mentioned it at present. But I should have spoken of it before long, so it does not matter. I won't say anything more this evening, but will leave you to think over the subject of my engagement. I will say, though, that Mr. Crisman is a very genteel and stylish young gentleman, and that mother is entirely satisfied with him. You know the house he is in is one of the best in the city, and there isn't a speck of fault of any kind to be found with him. As to money, he can make it fast enough if he is properly helped."

With this remark Miss Matilda left the room.

What was in Mr. Stull's mind during the next three days nobody knew. Even his wife, although she saw that the soul of her consort was a storm-center of passion, heard nothing from him except an occasional thunder-clap of indignation concerning her complicity in Matilda's engagement. That there was some reason greater than this for the wrath that raged within him was plain enough to her, but she had no idea what it was, and her daughter would not tell her.

To Miss Matilda, her father spoke not a word during this period. He ignored her. He did not even look at her. In fact he had

very little to say to any one. When he was at home he shut himself up for the greater part of the time in his library, and when John came to him at the bank he spoke as few words as possible, and made no allusion to his manager's intended marriage. John was content to wait awhile for his employer's decision, but he had determined, no matter what that decision might be, that he would marry Miss Burns.

But Matilda was of a different turn of mind. She was not willing to wait more than three days for a decision concerning her affairs. At the end of that time she went to her father's study, where she knew he had shut himself up. When she entered she closed the door quickly behind her and stood by it, her hand still on the knob. Her father on seeing her sprang so suddenly to his feet that he nearly overturned the table before him.

"Now, don't shout out anything, father," she said, "for old Miss Manderson is in the parlor with mother, and if you begin that way I shall just open the door, and if she hears you abusing your daughter the whole church will soon know it. As you won't speak to me, I have come to speak to you. I have been thinking over this matter, and I have worked out in my mind the very best things that you can do. In the first place, you must give up that restaurant business; it isn't fair to me, nor to Mr. Crisman, nor to mother and the girls, nor to yourself, for that matter, that you should keep it any longer. The secret is sure to be found out, and very soon, if John People gets married, which I know he will, and think he ought to, besides, for the young woman is very suitable. I have bought things of her several times in order to find out what sort of person she is. If that restaurant matter is made public while you are still in the business it will ruin us all as far as society is concerned, and you have no right to bring anything of that kind upon Mr. Crisman and me, to say nothing of your wife and two young daughters. I don't want to seem hard, but I have got to speak the truth. If it is found out after you are out of the business it will be bad enough, but it will be a different affair. I know very well that in this city it doesn't matter much what a man has been, but it matters very much indeed what he is. You can either sell out to John People, or to somebody else, and take a mortgage on what he can't pay cash for, so you will still have an income from the place without having anything to do with it. And the sooner you get rid of it, the safer and better it will be for us all."

During this speech Mr. Stull had remained standing, and at two or three points his lips and face had moved as if the provocation to speak had been stronger than the resolution he had taken to hold no converse with this un-

natural daughter; but, as was usually the case with him, his resolution triumphed, and he remained sternly silent. No one but his daughter Matilda could have forced a communication of any kind upon him, but he knew well that unless he was willing to take the consequences of a very disagreeable scene,—which he was not,—he would be obliged to listen to her.

There was another reason why, in spite of the rage which boiled within him, he stood and listened to his daughter: he was keenly interested in what she was saying.

Miss Matilda continued: "As for Mr. Crisman and me, the best thing to do is to consider that matter as settled, because, having made up my mind to marry him, of course I shall do it. If you ever intend to give me any money at all, there can be no better way to do it than to let Mr. Crisman have it, and put it into his business and be made a partner. He told me that the 'Co.' is composed of persons belonging to the house who have been taken in, in that way, and he says a partnership is open to him whenever he has the money. That will not only help me to become a rich woman, but will also give me a position in society, for being the wife of a partner in a leading mercantile firm is very different from being the wife of a mere salesman. And you know that my position in society will be as much to you and all the family as it is to me. That is all I have to say, and if you have made up your mind not to speak to me for a week, I don't object to waiting for the three or four days that are left; but if it is for a longer time than that, you'd better write to me what you decide to do. And now I'll go and send somebody to see if they can clean the carpet of that ink which you didn't know you spilled when you jumped up so suddenly."

XXXIII.

ON several occasions, moderately near each other, Mr. Stratford went to see Gay Armatt, and, together, they took up the old books and studies. But the reading and the discussing did not go on in the old way. Gay had lost her interest in her work and in her future, and seemed to have forgotten that she had had aspirations. If study did not actually tire her or bore her, at least the earnest enthusiasm with which she used to pursue it was entirely gone. Stratford was not slow to see this, and gradually, and always with a sufficient reason, he lengthened the intervals between his visits to Gay; and then, taking advantage of standing invitations from some of his old friends, he went on a visit of a few weeks to Boston and Cambridge.

He was glad to go. Not only did he tell himself that his work with Gay was done, but

she now told him, though not in words, that such work as he had been doing was done. The friends whom he visited did not find him quite the lively companion he used to be, and this proved to them that summers and autumns spent in sparsely settled mountain regions are not beneficial to the spirits of a man. One afternoon in Cambridge he was invited to attend a Thursday tea given by the young ladies of the Harvard Annex, which invitation he promptly declined. The friend who had proposed to accompany him was much surprised.

"I thought you took an interest in the higher education of girls," she said, "and would like to see what we are doing at the Annex."

"That is all very true in the past tense," he answered, "but you really cannot expect a person always to take the same interest in a thing."

Mr. Arthur Thorne, however, made it a point to visit at Mrs. Justin's house as often as he could find any reasonable excuse for so doing. He saw a good deal of Gay, and, in a measure, his society interested her. He gave her no law lessons, nor did he talk upon any subject fifteen seconds after he fancied that she had lost interest in it, striving always to find out what would best please her. He was often able to engage her attention pleasantly, and after a time she became rather glad to see him. Every day he grew more and more in love with her, but of this Gay knew nothing. Had she been any one but herself, or even had she been truly herself, she might have seen it, but just now her mental as well as her physical powers were working slowly and feebly.

Mrs. Justin perceived plainly enough that Thorne's love for Gay was becoming devotion, and this knowledge greatly troubled her. But there was nothing for her to do. She could not, with any show of reason, throw obstacles in the way of the young man's visits, for she had no right to constitute herself the guardian of Mr. Stratford's interests, and these interests formed the only possible reason why Arthur Thorne's course should in any way be obstructed. If she could have used obstacles at all, they would have been piled up in the present path of Mr. Stratford, who was wandering away from what was most desirable, just, and right, not only for himself but for Gay, and even for poor Mr. Thorne, who was blindly and ardently striving for something which she was quite certain he could never possess.

One afternoon when Mr. Thorne called he was told that Miss Armatt was not well, and was confined to her room; and the next day, and the next, and a good many days afterward, and often several times a day, he came and made inquiries, but he could not see her.

There was something the matter with Gay, believed to be malarial, which greatly prostrated her, but the disease was one in which the attending physician found very little of what might be called pronounciation. The malaria, which is so generally believed to be at the bottom of all disorders which do not assume definite and recognizable forms, declined to put forth any point which might advantageously be laid hold of. To add to this difficulty in the way of the physician, Gay would do nothing to assist him. All his appeals for cooperation on her part were totally unavailing. Food, medicine, and other agents for restoring health and strength had proved of so little service that after having lost her interest in them she seemed also to have lost interest in the effect they were designed to produce.

Mrs. Justin gave up all other pursuits of her life and devoted herself to the nursing of Gay. The relatives in Maryland were written to, and the married sister came to the city, but was obliged soon to return to her home and her family of small children. Other doctors were called in to consult with Gay's attending physician, but still that sly, cunning, and malicious malaria refused to come forth from the roots of Gay's energy and life, among which it appeared to have intertwined and intrenched itself.

Stratford came home from Boston, and on him fell not only the heavy weight of sorrow at the sad condition of his young friend, but sundry sharp stings from his own conscience and an amount of reproach and condemnation from Mrs. Justin for which he was not at all prepared. The time had passed, she believed, for ordinary censure or admonition. Stratford ought to be made to feel that on him alone depended Gay's restoration to health.

"Whatever else is the matter with Gay," she said, "I believe that her life is now ebbing away from her because she does not care for it. This world is empty to her. You made it empty, and you can fill it. Even now, if you become to her what you used to be, and give her the hopes which I am sure you once gave her, I believe she will want to live."

Stratford was much moved. "I cannot believe," he said, "that what you say is true. But even if it were true, and Gay's life depended on me, I could not save her as you propose without being false to her and false to myself."

Mrs. Justin looked almost angrily at him for a moment. "Then," she said, "you should not have taken from her the man who did love her."

Stratford walked home, his heart chilled and pained. The first thought that had come to him after Mrs. Justin's last words was that it was better that Gay should die than to be mar-

ried to such a man as Crisman. But now he asked himself: Was it better? Hard, cold reason did not deny him her support, but the support was neither cheering nor bracing. "Can it be true," the other question came to him again and again, "that I am the only one who can make her care to live?" He had believed that Arthur Thorne could be such a one; but now, when things were coming to him very bare and true and sharp, he could not say to himself that he had unreservedly hoped that Arthur Thorne, or any other man, would take Gay Armatt wholly to himself. There is a selfishness that sometimes lives within our noblest impulses without our knowing it. Some sudden burst of light may make the impulse transparent and show us the little hard stone lying at the heart of it. Some such light now broke upon Stratford, but he saw nothing plainly. All that was clear to him was that he must assert again and again: "I will be true to myself, and, thereby, true to her!"

Two days after this, when Arthur Thorne came as usual in the afternoon to Mrs. Justin's house, he met Stratford, who was just leaving.

"You cannot see Mrs. Justin," said the latter; "she has been up the greater part of the night, and is now asleep."

"How is Miss Armatt?" asked Arthur.

"They tell me she is weaker to-day than she was yesterday," answered Stratford.

"And that is what they said yesterday," said Thorne.

"Yes," said Stratford; and turning away his face, he made a step towards the door.

Arthur laid his hand upon his arm. "Tell me," he said, in words low-spoken but trembling with force, "can it be that I am never to see her again?"

Stratford turned and put his hands upon his friend's shoulders and looked for a moment in his face. Then he said, speaking slowly: "I have been to see her physician this morning, and I am convinced he has given up all hope of a rally of her strength. My dear boy, I am afraid that you will never see her again." And with that he went away, leaving Arthur standing in the hall.

The two men were not rivals: they loved each other and were now especially drawn together; but it was impossible for Stratford to talk longer with Arthur. The half-hour before, Mrs. Justin had come to him, and, putting a cold white hand in his, had said: "We must think no more about those things of which we have been talking. It is now too late." She did not say, "even for you," but there was that in her large sad eyes which carried these words straight into his heart.

Arthur Thorne stood in the hall until a maid-servant came to him; and knowing so

well who he was and why he came, she gently told him that the nurse, who was preparing some broth for Miss Gay just now, would stop on her way upstairs, and might be able to tell him something about her. And she opened the drawing-room door and left him.

Without answer, Arthur walked into the room, and, after a few steps, stopped, his eyes upon the floor. He was waiting for no one; he expected no one; he stood there without a purpose; he knew nothing in the world but that he should never see Gay again.

This young man was truly, powerfully, overwhelmingly in love. Since he had not been able to see Gay, he had loved her more than when he had been with her. His soul reached out toward her with an agony of craving that only a wildly loving heart can understand. His love was based upon no hopes, no expectations, no purposes; it had nothing to do with the future, nothing to do with the past; it was, simply, that now, this very moment, he loved her; his soul lived in her. And now he knew that never again should he hear her voice, never look into her eyes, never see her, in life again!

His blood ran fire and ice. He knew it was true that, although she was not dead, she had gone from him. He had no rights; he was nothing to her; he had never made himself anything to her. Why should any one allow him to see her again? To all intents and purposes he was an outside stranger. He would never see her again!

Suddenly his body trembled. His right hand stretched itself open, and then shut close and tight. His soul rose up in rebellion. This thing could not be. Heaven and earth might say so, but he would not admit it. It must be that he should again see Gay. She was not his Gay, but she possessed him wholly and utterly. He must see her again in life, were it only one glance at a tip of a curl of her hair.

Arthur Thorne was the most conventional of men, but down about him fell his conventionality as if it had been shaken to pieces by an earthquake.

He put his hat upon a chair; he listened; he knew exactly what he was about; every faculty rushed to the aid of the one action for which he now lived. He knew where Gay was. Mrs. Justin had told him of the large bright room at the back of the house adjoining the young girl's chamber, where, upon a lounge from which she could look out at the sky, she lay through the livelong day, thinking less, eating less, living less, as each day passed on. "It may be this is the one moment," Arthur said to himself, "in which I can see her. The nurse will come up, Mrs. Justin may awake, the relatives are expected. Now!"

With noiseless steps he passed along the hall, then up the one flight of softly carpeted stairs to a door with a portière partly drawn across it. He looked through the narrow opening into the large bright room in which of late his thoughts had so constantly dwelt. And, O Heavens! there was Gay, upon a lounge, close to the window, the sunlight falling on the soft folds of her lightly tinted dress and on the bright colors of a shawl thrown partly over her. It was Gay! He saw her!

The young girl lay perfectly motionless, her face slightly turned toward the window, her half-open eyes gazing out into the bright air but looking upon nothing. Her beautiful face was not changed in contour; all the roundness and softness and delicacy of outline were there, but the color had faded away. Her light-brown almost golden hair curled and waved, as of old, upon her forehead, and a mass of it was thrown to one side upon a cushion on which her head was resting. Her little hands were clasped together under her shawl, and they were very thin, and her form under its soft drapery was thin and weak and almost done with everything.

Gay, herself, was nearly done with everything. It was not a malady of the soul or of the affections which had prostrated this young girl, and under which her life was wasting. It was, indeed, that malignant and subtle spirit of disease for which the doctors had been seeking, and which would, long ago, have come forth, its head bowed for the death-stroke, had Gay brought up her forces against it. But she brought up none. Medicine and skill can do nothing without the assistance of vital force, and the only warfare in which Gay's young soul was able to engage seemed directed against the vital forces. All that would sustain her body or her mind had become repulsive to her. Her soul had ceased to be hungry, and the example of her soul was followed by her body.

This girl had been true to every normal impulse of her nature. She had had a purpose in life, noble, intellectual, of high aim. But this had not been all. She had loved. Thus stood her woman's nature, equipped for the battle of life. But love had been taken from her, roughly and suddenly, and the manner of its taking had been such that it had gone, absolutely and utterly. There had been nothing to take the place of this love. The warmest, truest friendship could not do it. Already a true friendship, unripened into love, had shown its powerlessness. What was left was a half-soul; and girls like Gay, with half-souls, die.

Gay was in a dream. It was a day-dream, although not one which sprang from her own volition. She was too weak for that now. Whatever came into her mind wandered there of its own accord; and the dream that now

came to her was one of earlier days, of the days when her life began to fill with purpose and meaning, and yet days that were so near they scarcely seemed to belong to the past. Into this dream came all her youth and happiness; and so came love. But it was not a vision of flowing streams and bending shades, of warm-tinted sunset skies, of the majesty of mountains, or the wide-spreading verdure of the fields. No kindred soul breathed to her words of high intent and stirring hope. She wandered in thoughtless bright content with the young Charlie she first had known and loved. The moonlight of their walks fell upon city squares and parks. They talked and laughed in the midst of walls and windows, cold ceilings and unyielding floors, but the spirit of young love made these as delicate of tint and tone, as odorous of perfume, and as soft of footfall as white clouds in the clear blue sky, the tender blossoms of the grape, and the soft grass upon the fields. This was the early, fresh, and blossom love, and as it first showed the signs of woman's life within her, so memory, wandering freely, went back to it and sat beside it, finding it purer, sweeter, more enduring than all else.

And thus the young girl lay, knowing no present and no future; lost even to all the past except that she was simply happy, and held the boy, Charlie, by the hand.

Suddenly she felt a touch upon her shoulder. A man was kneeling by her.

"I could not help it," he said. "I saw you, and I could not keep myself from coming to you. Will you not speak to me, dear Gay?"

She slowly turned her head toward him, and her large eyes opened wide, but in them was no surprise, no questioning. Just now dreams were to her like real life, and real life like a dream. She wondered not at either.

"Mr. Thorne," she said, in a voice very low and perfectly calm.

"Yes," said Arthur, his words trembling with passionate emotion which he was struggling to subdue, "it is I, and I came to tell you—Heaven has given me this chance, and I must tell you quickly. O Gay, I love you! I have loved you almost ever since I knew you! And now, dear Gay, it nearly kills me—"

The poor fellow could not speak his mind. His fine sensibilities would not suffer him to say to Gay that he could not let her die without knowing that he loved her. But this is what he meant.

Gay looked at him very steadily and quietly. Her mind was going back. "Was that the reason that you taught me law?" she said.

"It was the reason I lived," said Arthur. "It was the reason for everything I thought, and everything I did. O Gay, perhaps I

ought to have told you before, but then I did not think—and afterward came the time when there was no opportunity. But now I have this one chance. I know that you may not care anything about me, but I could not help it! I must come and tell you how I love you, love you, love you!"

As he spoke tears came into his eyes, and some of them rolled down his cheeks. Gay looked at him with more interest than she had looked at anything for days, but her manner was still very quiet and apparently untouched by any emotion.

"Do you know," said she, "that I am not going to live?"

Thorne did not answer, but the expression that came into his face showed, even to the listless mind of Gay, that he knew it.

"It is a great pity," she said, her large eyes still fixed upon him, "that you should feel this way now."

"I feel so now," he said, "and I shall feel so always. It don't make any difference what happens, I shall feel so all my life—always—forever!"

Gay still looked at him, but said nothing. Suddenly his manner changed.

"O Gay!" he exclaimed in a tone of almost wild importunity, "why will you die? It is too terrible, too dreadful! Why will you not do everything to make yourself live? They tell me you do not fight against Death. Why will you not rouse yourself up and fight against it? For the sake of everybody who loves you—for the sake of this beautiful world—for your own sake, dear Gay?"

She looked at him for a moment, a slight shade of uncertainty upon her brow. For weeks she had received from Mrs. Justin, from her doctor, from her attendants and friends, the most earnest and anxious entreaties to battle against Death, but there was nothing in Gay's nature to give response to these prayers, and day by day they fell upon her ear colder and more commonplace. But the words spoken by Arthur Thorne, coming from him, and in this way, and at this time, and with something behind them of which her mind took cognizance but did not act upon, seemed altogether different and novel.

"What do you mean?" she asked.

Arthur did not answer. The words that came to him were too many, too ordinary, too weak. His eyes fell upon a tall heavy flask, the sight of which struck a pang to his heart. He knew it well. It contained a strengthening and revivifying cordial which had been ordered by Gay's doctor, and which Arthur, at Mrs. Justin's request, had procured for her. This he had done more than a week before, and as it now stood between him and the light it told

the tale of this young girl's surrender. Its contents could scarcely have been tasted.

Arthur arose, and approached the table. He did not speak; he could scarcely shape his thoughts. The power of this remedy, upon which so much hope and reliance had been placed, had never been tried. Somewhere there was a cruel sin. He had made himself well aware of the nature of the cordial, for it concerned Gay. Pouring a small quantity of the liquid into a glass, he again knelt by the side of the young girl.

"Will you not drink this?" he said. "It will help you to fight Death. Dear Gay, do not refuse it!" And he held the glass toward her.

She looked steadily into his eyes, and upon her lips came a smile, faint and shadowy; but no fainter nor more shadowy than the interest in life and this world that awoke within her.

"If you wish it so much, I will try," she said. "But you will have to raise my head."

With the glass in one hand, Arthur passed the other beneath her head. Her soft masses of silky hair enveloped his hand, and some of it fell over his wrist. It was Gay's head that lay in his open palm, warm, round, and heavy. She could not lift it; he it was who should raise it! Every fine hair that touched him seemed to send an electric thrill throughout his soul and body; it belonged to that dear Gay whom he loved.

Slowly and gently he raised her, and placed the glass to her lips. She drank it, and then he tenderly lowered her head and drew out his hand from her hair.

Gay turned her eyes toward him with a full, earnest gaze. "Thank you," she said, "and I think you had better take some of it yourself. You are very pale."

That she should say it was enough. He rose to his feet, poured out a glassful of the cordial and drank it. Then he came back to the lounge.

"Do you feel better?" she said.

For a few moments Arthur could not speak, and, when he did, his voice was husky and slightly tremulous. That she should think of him!

"Dear Gay," he said, "will you not let them give it to you? Think of this dear world, and do not die. And now I must go. Perhaps I have staid too long. But I have seen you! I have told you!"

She drew out from under the shawl one of her thin little hands, and Arthur clasped it in both of his own. He was about to press upon it a passionate kiss, but with a sudden effort he restrained himself. He had told her; that was all; and he had no right to touch her with his lips. His eyes filled with tears, and he left the room.

When the nurse, who had experienced delay-

ing difficulties in the preparation of a delicacy with which she designed to tempt whatever lingering trace of appetite might yet remain with her young charge, heard above her the quick closing of the front door, she exclaimed: "There! that gentleman has gone! But I can't say I'm sorry. It's a harder thing to answer his questions now than it ever was before."

An hour or two afterwards she said to Mrs. Justin: "I wish that young gentleman had staid, for I know it would have pleased him wonderful to hear that Miss Armatt took three tablespoonsfuls of the broth I made her. How she suddenly came to have all that appetite I can't imagine."

(To be continued.)

Gay was then sleeping, and when she awoke Mrs. Justin was sitting by her side. The eyes of the young girl instinctively moved towards the window, outside of which the air was still bright with the light of day; but suddenly she turned them on her friend.

"Dear," she said, "don't you want to give me some of that drink Mr. Thorne poured out for me?"

"Mr. Thorne!" exclaimed Mrs. Justin.

"That is it," said Gay, glancing towards the table. "He was very good, and I am glad I took it."

Frank R. Stockton.

SNUBBIN' THROUGH JERSEY. II.

HIS first attempt to turn the *Cowles* at Titusville had failed dismally. At the critical moment and when the *Cowles* was within an arm's measure of turning her full length, the line had parted, blocking the whole traffic of the canal, and filling the air with the pungent objections of

the Patriarch quietly, closely examining her stern, "I could handle her."

Behind the locker in Dusenberry's private cabin aft was an ordinary 100-foot tape-line. The Patriarch took one bank of the basin and one end of the line and Scraps the other. Less than the boat's length below, careful measurement showed the canal slightly wider than where the *Cowles* lay aground. At this point the unwelcome difference of three feet was reduced to two. The Patriarch now crawled along on his knees, plunged his arm under the water, and felt carefully the muddy edge of the yielding earth bank. The profanity of the

half a score of captains, who, from chunker, skiker, and barge expressed in English, terse if not elegant or pious, their condemnation of a "pissel of fools who would try to sail a grain-boat over a ten-acre lot."

"If she was three feet shorter," remarked

impeded chunker fleet temporarily ceased, and a curious and expectant crowd of natives followed his movements with attention.

"Here we are!" he shouted, springing to his feet. "Get out another line, warp her down, and run her nose in here. The muskrats have done it. Here's a 'cave-in' as deep as a well."

Later in the evening when Dusenberry, seated on his cabin top, smoked his pipe in the moonlight, with the bow of the *Cowles* turned toward Trenton and the tow-lines coiled on deck for the morning start, he was overheard to remark to his wife between the puffs: "Marthy, queer kind of canalin' this, rootin' round in musk-rat holes. Never knowed

brought milk, another berries, and a fourth a request from a bevy of pretty girls timidly eying the awnings and flags from a bridge beyond, that they be allowed to come aboard before starting.

Will the artistic eyes gathered around the charming table in the cozy *salon*, with the sunlight sifting in through the awning overhead, ever forget the oval face with the brown eyes framed in the Gainsborough hat, and how daintily she poured tea from that old Satsuma pot covered with pink and yellow peonies, which the Scribe treasured? Were not the rugs spread on deck and the cushions piled high, and was not the Scribe's guitar handed up, and do they not often hear now in the stillness of their studios the soft voices blending with the gurgling plash of the water about the bow and the cry of the tow-boy as he urges his rested mules back to Trenton? Finally, is it not a tradition that this digression up a feeder, although not on the original programme, left behind it some of the most lasting impressions of this most eventful expedition?

But Trenton hove in sight. Before even the outlying bridges were reached there could be seen the dense smoke of its many chimneys clouding the summer sky, while the roar of constantly passing trains heard afar off bespoke its busy life.

Our tow-boy was not an engaging-looking boy to contemplate. Since his first appearance on deck the previous afternoon he had remained at the end of his tow-line and steadily cared for his team. At this distance he presented a travel-stained, bedraggled aspect. The remnant of a slouch hat clung to one ear, a shock of red hair slanted like a thatched roof over the other. His shirt, trousers, and cowhide shoes presented a series of patches as varied as a sample card. Over all these was ground and smeared and plastered the red dust of his native State.

The Scribe had regarded the patient, plodding form of the tow-boy for some hours. As he looked now and then over his book from his easy-chair under the awning in the afternoon light, he could see him a cable's length ahead, now walking, now riding, now, again, resting, stretched out full length on the near mule's back, with his head reclining on the crupper of the harness, and his feet hooked in the hames and collar, fast asleep.

"Boys," said he, after some reflection, "that tow-boy doesn't have much comfort in life. Let's invite him to dinner."

Whether it was owing to the novelty of the idea, or the old spirit of Bohemianism and good fellowship that characterized the group,—and, for that matter, all other such groups the

RAISING THE UPPER GATE.

them varmints wuz good for anything before 'cept to skin, and they ain't."

Then he leaned forward and whispered, "We might have done worse than winterin' here. Guess the pay would 'a' held out."

THE morning that broke over the pretty village of Titusville was one to be remembered. A sound sleep, a plunge in the cool basin, and a cup of coffee on deck before the sun had crept up the hill far enough to get a good look at the *Cowles*, refreshed everybody. Nor was the sun all alone in his anxiety to see the show-boat. The people turned out. One man sent down half a cartload of ice. Another

world over,—or whether their individual kindly sympathy prompted the courtesy, is not known; but it is a fact that Brashies instantly called Moses and ordered another plate at table, and that the Patriarch and Scraps proceeded at once to carry out the Scrib's idea.

He came up to the side of the boat, and looked up with an air of wonderment that was delightful. He warn't rigged for comp'ny. Chuck him a bottle of beer and a sandwich. He warn't hungry. But that didn't suit the Scrib. He must slack up his tow-line, tie that team by the willows, and come aboard now while the soup was hot.

"Well, if you crowd me," he said; "though you kin see I ain't fitten."

When, however, he descended the broad staircase into the hold and caught sight of the rich interior, with its softened light from many colored lamps and lanterns, and the luxuriousness everywhere apparent, then the dinner-table, with its refreshing linen and masses of wild flowers filling the center, he slid down upon the nearest divan with the remark: "Gosh bang! but you fellers hev slickened her up!" After that nothing could move him. He would have a pipe if there was one handy, but he didn't want no "wittles."

Whether it was the mild stimulant of the Long Jack, or the perfect equality and good fellowship that surrounded him and was steadily maintained, which broke down his reserve,

WAITING FOR THE TOW TO MAKE UP.

is not worth deciding; but thus be it said, that the Scribe interested him at once in his profound ignorance of the genus mule. "Guess you never lived with mules," said Monahan. "When you come to have them by yer fifteen years you finds them out." Then followed some revelations based upon personal observations. To the world in general the mule is a stubborn, vicious, and unintellectual beast, not safe abaft the beam. No one credits the animal with ambition, character, or any feelings akin to human moods; but to all this the driver emphatically objected. "Kick? why, of course;

I slacked up the line to slide by. I was on the mule. First I knew, we was all five of us in the water, the four mules scared to death, and the yacht and the schooner havin' a swearin' match. I yanked the string that slips the hook in the whiffletree, set free the mules, and got 'em all out. Then I joined sides with the schooner."

It was Monahan's opinion that canaling was healthy if people would walk enough to keep well. He often made two fourteen-mile trips a day, and one day within a week had done thirty-eight miles with a light boat, starting at

ON THE BORDER OF AN OVERFLOW.

it is the way they talk, same as a dog's tail. They won't kick you if you treat them decent. I have had them white ones more 'n five years, and never a cross word out of 'em. That old wheeler knows as much as I do. When I'm asleep on his back, and we comin' to a bridge, he ups and lets drive with his heels, much as to say, 'Who's runnin' this team?' Nights I always sleep on the long stretches, 'cause I know he'll slack up and drop the line for a boat to pass when he sees a light near to. He follows me 'round like a dog."

"How did you do it?"

"Reckon he remembers how I fished him out of the drink one night. Some galoots from down river, goin' through in a small yacht, anchored and went to bed. I guess they was the first crowd ever anchored in the canal. I came along with an old schooner called the *Tempest*, full of coal, bound for New Haven.

five o'clock in the morning. The drivers were all ages, from twelve years up. They got thirty dollars a month and board through the season. They put up at any station where they happened to be, and were on call in turn. It might be that they had only time to feed the team before starting on another lift. Each driver had the entire care of his team and harnesses. His own rest and sleep must be taken in snatches. No, they didn't count much on things between meals.

The braying of one of the impatient teams put an end to the interview, and, with profuse thanks, the guest hurried to pick up the slack line. It is a short run from Trenton down to Bordentown, and for the most part devoid of particular interest from a picturesque point of view. The tow-path is splendidly kept up, and through the trees a short distance away the Delaware glimmered in the sunlight. As

ONE OF THE HOPKINSON HOUSES, BORDENTOWN.

the canal approaches Bordentown it widens out into a basin of considerable size. Several small ponds lead out of it. On their banks two or three busy shipyards, where scows are built, find their place. Along a tongue of land extending into the basin was a group of small picturesque houses, completely in character with the place. They faced on the narrow lane. At the back door of each house was a landing with one or two skiffs tied to posts, and the water lapping the lower step. Off to the right of the company's office are the stables; for this, like New Brunswick, is one end of the Raritan canal. One more deep lock and the Delaware is before the voyager.

There was every reason why the deck should be occupied by an anxious and expectant group as the *Cowles* neared Bordentown. Every square acre of this lovely village is historical ground. Here in the good old days Benjamin Franklin spent a night. Here lived Joseph Bonaparte, the elder brother of Napoleon I., sometime king of Naples and of Spain; Prince Lucien Murat; Judge Joseph Hopkinson, the author of "Hail, Columbia," and his father, Judge Francis Hopkinson, the signer; Commodore Stewart, known as "Old Ironsides"; Parnell's mother now resides there; and here lived Tom Paine, and the family of Yturvide, the Mexican emperor, who passed several months here a short time after the husband and father met his death at the hands of his own people in Padilla.

High up, overlooking the winding canal and the gently curving Delaware, is the bluff, or real-

ly promontory, near which Bonaparte built his mansion. The noble trees fringing the wood-crowned height could still be seen from where the *Cowles* was moored; but the grand old house, with its richly carved doors, ample stairway, generous library, and dining-room enriched with ornaments and bits of furniture from the Luxembourg, has long since passed out of the memory of any but the oldest inhabitants.

In the quaint streets of the old-fashioned town can now be found the sloping roof and dormer-windows of the Murat house, where Madame Murat taught school in the days of their poverty; and farther on the old Hopkinson mansion, where for the first time, to the accompaniment of the harpsichord, were heard the strains of the national anthem.

The whole-souled hospitality for which the town has been noted for more than a century was not wanting, and half an hour after the boat had been made snug and safe with her bow-line over a wharf-post and the stern-line to one of the mooring spiles, the entire party were booked for a game at tennis, a drive through the suburbs, and unlimited invitations to break bread in a dozen houses at once.

The Patriarch and Brushes, by reason of their kinship with some of the earlier settlers, felt instantly at home, and prepared to make everybody else so. Extra Chinese lanterns were unpacked and hung on deck; some rich silks and Venetian embroideries thrown over the standing easels; the 'cello was re-strung; an extra dozen of plates and an equal number of

CAPTAIN DUSENBERRY.

cups and saucers were purchased, that Moses might catch his breath between soup and fish; all the brass jars and pottery filled with such wild flowers and tall grasses as could be hastily gathered; smoking jackets, old pipes, well-worn slippers, and like bachelor traps and trappings tucked under divans and behind the furniture, and the whole interior, by a cunning touch here and there, was transformed into a lady's boudoir.

Moses was in his element. Ices revolved around on deck, served in after-dinner coffee saucers, followed by relays of cake (Bordentown brand) on a Delft plaque. Punch was brewed down in the salon in an Imari bowl, and ladled out in small Venetian cups of a varied and difficult pattern, but yet of a certain homogeneousness of form and style when not seen too close together.

Maidens in the freshest of summer costumes reclined on the Turkish divans. Up on deck, in out-of-the-way places, far forward or aft, behind the apron of the awning and other such secluded spots, couples were tucked away and only discovered by the red spark of a cigar or the ringing laugh that told the story of the night. If the stately dames who graced the drawing-rooms of the olden time could have looked down upon the fair faces and forms of their descendants, they would not have believed in the degeneracy of the times.

During all this festivity there was one grim, solitary figure who sat like a Sphinx. He moved only once, and that when a lantern fell from a slat in the awning above, rolling its candle at his feet. Then he rose from his seat beside the useless tiller, ground the taper

under his heel, and stealthily dropped the harmless Japanese decoration overboard.

"They'll blow us up, be gosh! they will," he said. "Wish they'd take them women folks and get out and let a man sleep. Here it is after midnight. Marthy, if they don't stop this racket I'll begin swabbin' the decks, I will, be gosh! and drown some on 'em."

Dusenberry's murderous intent was, however, never carried out. It is true he swabbed the decks; but not until the gray dawn had broken into dappled gold were the sleepy inmates of the grand salon awakened by the tramp of his bare feet overhead striking the deck like a wet fish. Then the swash of his bucket scattered the water through the half-open hatches, and roused the inmates.

"Moses," came from a divan far aft, "go up on deck and tell the captain to be careful of his water. Regular mill-stream pouring down my back!" And "Moses," called out another, this time the Scribe, "bring me a bath towel, and let down the awning-apron, and put out the ladder. I'm going to have a dip overboard."

"So am I," returned the Patriarch, springing from his couch.

In less time than it takes to tell it, all four heads were bobbing about like corks in the cool water of the canal, after which they all wormed up the straight ladder, were rubbed

THE LOCK-TENDER'S ASSISTANT.

down like race horses, and in five minutes thereafter were taking their coffee from the fragrant pot over which Moses presided. This was always on deck in the open air and sunlight, from a low table convenient to cushions and rugs, and within reach of every man's outstretched arm.

Viewed of a Pullman buffet car, all dust and water, inhabitant of a White Star saloon cabin,

hangings curtaining off the after-part of the hold, and reappear with an easel, which he placed in a favorable light under the hatch. Then he tiptoed back and returned with a canvas and palette. He whispered to the Scribe: "Look at that girl's head—regular Titian! Tell Brushes to keep on until I get an outline of it. Please don't move, my lady; you are positively delightful."

THE DESERTED HOUSE.

with its air full of carbonic acid and its table rack-worn and empty! do you know what it is to breakfast on deck in the soft morning air, with the fleecy clouds overhead, the shimmer and splash of water among the cool of sedge and lily pads, and the green fields before you fringed and backed by dark cedars? Of course you don't, and never did. Misguided traveler! return to the ways of your ancestors! Try a canal-boat.

By nine o'clock sundry friends who had helped make the previous night merry were hailed, welcomed, and escorted up the gang-plank and down into the salon. Breakfast was served in due course without a protest from Moses, who, assisted by "Marthy," struck from this Jersey rock not only water, but other liquids and solids not referred to in the original text.

Then the music was hunted up, and Brushes drew his bow across his 'cello, and guests and hosts sank into easy-chairs or threw themselves on the divans as the symphonies of Beethoven filled the interior.

It was then that Scraps was seen to start from his seat, disappear quietly behind the silk

But she did move, only to strike a more charming pose, and so did the entire group. Then the symphony ceased, and soon two more easels bore down like a battery upon the lovely head with its arching eyebrows and golden hair, and thus the early morning hours slipped away.

HEADING a procession consisting of five or six coal-boats, two oil-boats, and a two-masted schooner, the *Cowles* pulled out in the cool hours of the next morning with all flags set to the breeze. From Bordentown up to Trenton is a steady lift. The first lock has a rise of fourteen feet, and the next two are very nearly as high. On the right bank the heavy trains puffed up the grade, and on the other, shaded by the lofty wide-spreading willows and constantly tempted by the grassy green bank, almost within reach, the patient mules plodded along in the red dust. For three miles the bank behind the tow-path is very high and compactly built, with willows thickly planted, a veritable bulwark against the Delaware, which sweeps along a short distance away. In the spring the river comes up to the very banks, and is a constant source of danger. At

such times the path-walker is on duty day and night, plugging the smallest holes with sod, filling in where the rain has started a gully, and building the bank higher where it has washed away. In ordinary times each walker has a stretch of fourteen miles to watch. He walks down the tow-path one day and back on the heel-path the next, with a shovel or pick with which to make repairs, or armed with a scythe to trim the briars, ivies, and elders. His worst enemy is the musk-rat, whose holes, running far into the bank, may at any moment make an outlet and become a dangerous break. Against these ravages the company supply a special guardian in the person of the ratter. The whole length of the canal is divided up among several men who make it their business to trap musk-rats all the year round. They use an ordinary steel trap without teeth, which they set as near as possible in the path of the main entrance or regularly used track to the rat-hole. The men are paid wages by the day, and the noses and tails are redeemed by the company at fifteen cents once a month. The pelts belong to the ratter, and are cured by him, to be sold later at an average of about eighteen cents each. Any rat trapped within a mile of the canal is a legitimate catch, and a day's work is from ten to fifteen.

"What harm can a rat do a mile away?" asked Scraps.

"He may come over here any fine morning, and if he don't, his children will. You can't count on a rat till he is skinned. I have been trapping them thirteen years, and I don't know all their ways yet. Sometimes they are too cunning to go within ten feet of a man's track, and other times they will walk into a bag and lie down."

THE BOYS FROM THE POTTERY.

A RATTER.

Then, as a special favor, he produced from the lock-house a white musk-rat caught by him and stuffed by the same hand, in an attitude which the animal never could have assumed when alive, and which was suggestive of the three-toed sloth in the museum.

"What I don't understand," said the ratter, as he fondled a pile of pelts, "is, why any animal wastes so much backbone in tail." As no one was prompt with a solution of this, word was given to the tow-boy, and the slack line was taken up.

The canal below Trenton is considerably discolored by chemicals, mostly iron, which are poured into it from the works on the banks, but on the high level where the feeder comes in, the water is comparatively pure. The boys from the potteries which stretch along the tow-path towards Princeton make full use of their opportunities. The *Cowles* was in luck, and approached this quarter during the noon hour.

"Hey, Micky," said an urchin, as he poised on a post ready for a dive, "look at de circus!" "Tain't no circus; that's a likeness boat," said Micky. Another one offered to chip in and buy the occupants some long pants, while a companion of his, dripping with water, offered to swim out and lick the cook for four cents. Moses went below, and the opportunity passed. During this running fire the windows in the potteries were crowded with heads, and each head had something to say. The canal literally swarmed with boys of all ages, colors, and proficiency in swimming. They ran ahead of the boat, took a long dive, and came up in time to catch the tow-rope, or perhaps one would

get astride of the ruddier-lilale, when instantly others plunged in, made a race for him, seized him and each other by any available limb, and hung on in a bunch or strung out in the wake with the boat under full headway. But the approach of a propeller, one of the line which sends through one boat each way daily on the way to Baltimore or New York, quickly scattered the boys, and in a few minutes the

shadows deepened and the blue vanished from the sky, a procession of coal-boats, each with its green light forward, passed silently in review and disappeared around the bend. Against the dark background nothing could be seen of the mules, but in the water, reversed, were their reflections perfectly outlined. As the boats approached they seemed to take on an unusual size, and with it an air of dignity.

A NEIGHBOR NEAR KINGSTON.

Crocker was outside the city and fast approaching green fields and grateful shade. Long before the afternoon had gone, a halt for the night was made near a picturesque clump of willows which partly obscured a deserted house. Its storm-beaten eaves were almost overtopped by the weeds which luxuriated in a tangled garden. Atop the broken palings of the fence an ivy and a trumpet-vine found their devious paths, and along the bank which once skirted the walk blossomed a profusion of pink, black, and white hollyhocks. The team was sent ahead to the next station, with orders to call at nine the following day. Sketching-traps were fished out, and everybody was at work. The Scribe gathered the blossoms, Moses started off afield with a basket on each arm, and in twenty minutes the *Crocker* was deserted save by "Marthy" and her lord. On deck, after dinner, as the long

There was something impressive in their silent, steady advance, as one after another their lights came into view, approached, and passed. The boatmen were silent. The man at the helm, attracted by the unusual illumination on the *Cowles*, in a low tone called his mate, or spoke to his wife, and said no more. Wearied with steering all day in the hot sun, and anticipating an all-night's run with a bare chance of hitting the tow at New Brunswick the next morning, the men paid little attention to anything else than the work before them or the necessity of resting while opportunity offered. Early in the procession a detached team passed, the whiffletree chains clanking against the stones, and the tow-boy singing to himself as he rode by, seated sidewise on the rear mule, with his back to the canal.

"He's happy."

"You bet," came from the darkness, into

which the Scribe's remark had penetrated. "No more teaming to-night; I've cast two shoes on the leader and broken a trace, and there ain't no smith nearer than Kingston."

Suddenly, at a distance through the trees shone a strong, steady light somewhat higher than the others; then the first rays of the moon caught something white moving in the tree-tops, and in a moment more the tall masts of a schooner, with topsails bunched, appeared against the brightening sky. As she passed close to the *Cowles*, the Patriarch, Brushes, and the Scribe vaulted aboard, intending

Brushes, "we'll get on the next boat we meet and ride back."

Twenty minutes later a light boat approached, and as she passed, the trio, relying on their welcome, hastily transferred their persons. As the shining awning of the *Cowles* again came in sight, the Scribe pointed it out to the puzzled boatman. Then instantly it was all clear to him. "Bin down along advertising; where do you show next?" Just as the party clambered on board and bade the *Mary Ann* good-night, Dusenberry disappeared in his cabin, saying, "Marthy, these fellows been

"MANNED BY CHILDREN."

to get off at the next bridge, wherever that was, and walk back on the heel-path. It proved to be the schooner *Wave*, which had loaded with coal at Philadelphia for Bridgeport. Why did they go through the canal? It was more convenient. Running day and night, the passage is made in thirty-six hours. Wasn't it partly because they were afraid to trust the old hulk outside the capes? That had something to do with it. How far was Kingston? Five miles. How far to the next bridge? Four miles. How could the gentlemen get off? Couldn't unless they'd swim. The boat was deeply loaded and had to be kept in the middle of the canal. "All right," said

off snaking some peach orchard. There'll be 'n officer aboard here next, and we'll have to swear they was in bed. If the Lord ever gets us back to old Erie, I don't want any more side shows in mine."

Just before sunrise next morning the rumbling of a thunder-storm and the pattering of heavy drops on the deck overhead brought every one to his feet to lash the awning and make things secure. The two after-hatches were closed. The forward one was tilted in the direction of the storm, and with the flies of an old tent, an abundance of cord, and a few screw eyes, a canvas fence as high as the shoulders was built about the gangway to keep

THE stern of the "TERROR"

was evident. Everything shone in fresh paint of decided hues. The rudder-blade was deep blue and the tiller striped with yellow and brown. Across her square stern in white letters on a black ground, festooned with filigree, was painted her name, the *Terror*. Towards night the sun broke through, and the day ended in a brilliant display of cloud scenery. With the first patch of blue sky word was sent by a passing chunker to have the team up at eight o'clock that evening. While at dinner the voice of Dusenberry was heard in conversation with the tow-boy.

"You fellows going down along to-night?" came from the tow-path.

"They say they be," said Dusenberry.

"Where will you tie up?"

"Somewhere this side of York; I ain't makin' no plans."

"Ten Mile Lock?" inquired the persistent driver, anxious to know what his trip was to be.

"Give it up," said Dusenberry; "this is good enough for me."

After a brief silence the gentle ripple of the waves pushed up by the square nose of the *Cowles* indicated that she was once more under way. The landscape by night was that of a new country. Before the moon rose it required a keen eye to follow the shore, and a practiced hand to keep the boat off the bank. Steering a canal-boat seems easy, but it is sometimes harder than it looks. An empty boat, eight feet out of water, with an awning to catch

the rain from blowing in. Dusenberry had his hands full with his own awning, his bird-cages, and Marthy in terror of the thunder. "No use leaving here to-day," said the Patriarch, as he and the Scribe prepared for their plunge in the drizzle. "This is our first gray day, and we must make the most of it. Here's a haunted house and no end of stuff within reach." There was no dissenting opinion, and Dusenberry was therefore ordered to send word by the next passing boat, countermanding the order for the team.

"We can run down in the night," added Brushes. While breakfast was being served in a sheltered spot aft, the hatches were lifted to air the salon. Marthy as usual improved the opportunity to make up the divans and put things to rights. The withered flowers were thrown away and the vases replenished with fresh ones. Moses cleaned and trimmed the lamps, took account of stock, filled the pitcher with ice-water, and then busied himself with the breakfast dishes. The forenoon was spent in watching the clouds, tinkering, writing letters, and overhauling sketches made on the trip. Scraps was busy with pen-and-ink drawings intended for reproduction. The Patriarch, suddenly alarmed lest all the glory of the unique interior should some day vanish like the flame from a candle, started an elaborate pastel, and Brushes, sharing his fear, laid in one corner of the boat in water-colors. When the rain ceased, nature was again at the mercy of the brush and pencil, and the knights made the most of it. From the deck the most picturesque of the passing boats were hastily sketched. One appeared to be manned by children. On the top of the house were two little girls, and peeping over the edge of an empty, painted box, evidently kept for the purpose, was a third. The helmsman was a boy, who ate his lunch as he swung the tiller. On another boat the helpmate was doing the family washing, in spite of the weather. The commander's pride in his craft

BELOW PRINCETON.

ABOVE THE LOCK AT KINGSTON.

every breath of air, will give a strong man plenty of exercise. In the darkness the lights behind on the bridges where the country roads cross the canal glowed like stars low down on the horizon. Suddenly the *Cowles* rounded a bend, and a bright light seemed to shoot from a clump of dark trees. "Blow your horn, blow your horn!" yelled the tow-boy. "How was I to know this was a bridge," grumbled Dusenberry as Marthy finished a long blast, and gathered breath for another. A moment more and a stream of yellow light from the bank illumined the whitewashed bridge as it swung upstream. The *Cowles* grazed the end, bumped heavily against the heel-path bank, and headed around for the next stretch. The rising moon solved Dusenberry's severest perplexities. A bridge a mile off was in plain sight. Under the railroad bridge at Princeton Junction, by the beautiful farms which stretch up to the collegiate town a mile or two to the left and on towards Kingston, the *Cowles* went at a good pace. The moonlight completely disguised familiar scenery, and when the tow-boy slacked up to let the boat run into the lock at Kingston, no one recognized the place. Sometime after midnight, while the Scribe, who had volunteered to relieve Marthy, was taking a trick at the helm, the low white buildings of Ten Mile Lock

appeared. The *Cowles* found a place at the crib among a number of boats heading in both directions, and made fast. The lights on deck were extinguished, the two after-hatches closed, and all was quiet for the night. Far away astern somewhere among the Roman candles and empty packing-boxes, in the direction of Dusenberry's cabin, came a sound of no uncertain meaning. "Brushes," said the Scribe, as he adjusted his mosquito-net, "his snore is worse than his war-cry." Early in the morning the lock-tender came on board with the mail, which he had thoughtfully gathered at the Bound Brook post-office, some three miles off. Moses returned to the lock-house in his company, and long before the heat of the day three hundred pounds of ice were stored in the refrigerator, and with it fresh vegetables, blueberries, chickens, and all that could be spared from a passing butcher's wagon. It was the middle of the forenoon before the team was summoned. One more run would end at New Brunswick; the next morning would dawn with the *Cowles* at New York, and the outing at an end. But there was no escape. The charter of the boat ran out the next day, and she must not only be handed over to her owners promptly, but delivered empty. Without special interest the hours passed, until about five

o'clock the high railroad bridge at New Brunswick loomed up in the distance. Had the New York tow gone? No, the huge tug was made fast to the coal-wharf and near by her boats enough to make up a tow. Nothing now remained but to await the ebb tide.

"Brushes," said the Scribe, as the great tow fell into line on its way towards New York from New Brunswick, "Dusenberry has just interviewed me as to what this expedition is all about. He says we hain't showed nowhere, nor give no concerts, nor pulled teeth, nor

eling coal don't help one's temper or one's appreciation of the Venus of Milo. Dusenberry isn't so bad as he seems. When Moses broke the Delft plaque yesterday and was about to throw the pieces overboard, Dusenberry caught them on the fly, and he and Marthy have been all the afternoon trying to stick them together with flour-paste as a decoration for her kitchen."

"Verily some good seed has fallen on apparently stony ground," mused the Patriarch, half aloud.

WILLOWS NEAR PRINCETON.

distributed no hand-bills, nor asked nobody to subscribe to no book; we hain't sold no ancient things 'cept we did it at night, and he and Marthy has watched and nothin's gone over the side, and he should like to know. now we are p'inted for home, what we started for, and whether we got it, and whether it's any fault of his'n if we hain't."

"Tell him," said the Patriarch, who was stretched out on the deck watching the sunset clouds mirrored in the still waters of the widened river, "tell him our sole object is to improve our digestive apparatus, our breathing apparatus, and our ability to sleep eight hours at a stretch, and that if he would laugh more and grumble less it would not be half so hard for him to swing his tiller, and twice as easy for him to be agreeable to his neighbors."

"Make allowance for his early training," chimed in Scraps. "Driving mules and shov-

"And that isn't all," continued Scraps. "Only to-day as I lay dozing on my divan I overheard Dusenberry tell Moses that he guessed next week the old girl (that is, the *Cowles*) would look naked enough after the stuff was h'isted out of her, and that this trip had kind o' spiled him for canalin'."

"Oh, ye bric-à-brac gods," piously rejoined the Patriarch, intoning his voice. "Another convert."

A general comparison of notes and observations followed. Brushes said he also had remarked that Dusenberry had acquired of late a habit of assorting the wild flowers that daily came aboard, and had made one corner of Marthy's kitchen fresh and cheery with field daisies and fragrant water-lilies. The Patriarch, being pressed, admitted that he had caught him examining intently the wrong side of a Turkish rug and speculating with Marthy

as to the possibility of her duplicating it the next winter. The Scribe chimed in that it was catching, and that he had detected the tow-boy tying dandelions to his hat-band, and braiding the mule's tail. All agreed, however, that the captain was undergoing a positive change of heart. This became certain when below New Brunswick the *Cowles* was crowded out of her position and forced on the outside of the main tow to take

during the preceding three weeks were reclaimed, assorted, and packed away. A subdivision of colors and brushes and an interchange of sketches took place. Fragile lanterns and the more delicate silks and hangings were packed in convenient drawers. The great Sypher chest was filled with the extra rugs and cushions, and the smaller and more breakable bric-à-brac bestowed inside the original studio cases under the after-hatch.

THE "COWLES" IN HARBOR AT TEN MILE LOCK.

unprotected the thumping around the *Romer*. When this occurred, the deck and salon waited as usual for the sulphurous smell which generally followed any expression of Dusenberry's opinions to his fellow-boatman on occasions like this, concluding with an ardent wish for the immediate consignment of the whole load of second-hand truck to a climate warmer and more remote. Judge, then, of their surprise when this came sifting down the open hatches.

"Get out that fender. Get it out, gol darn you, and get aft with it—quick. Want to smash something, do you? What do you think we've got aboard here, anyhow,—potatoes or baled hay,—that you're kicking 'round like a loose mule? You break something and you'll find out! Why, be gosh, we've got teacups and sassers aboard here worth more'n your whole mud scow, mules and all."

THE expedition was nearing its end. This was seen everywhere. Sketches which had been tacked up for a day to dry and left permanently to decorate were slid into portfolios. The book-shelves were dismantled and each occupant claimed his own. Knickknacks, pipes, tobacco-pouches, slippers, caps, and painting-jackets which had been used indiscriminately

It was evident that the beauty of the interior still possessed the occupants like a spell; and as each man removed from its place some rare object which had gone to make up the unique salon, he felt a pang as though ashamed of the work he was engaged in.

At last the tall spire of Trinity could be seen outlined against the morning sky, and the great bank of yellow fog hanging like a cloud over the city.

The tow broke up into sections. One to Gowanus, another to Newtown Creek, and a third to Redhook. The *Cowles* under special tow glided up to her dock at East Thirty-fourth street, the home of the wharf rat and the dock tramp. As she neared her berth a man could be seen climbing a tall spile. Presently he waved his hat and shouted through his hand:

"What boat's that?"

"The *Seth G. Cowles*," returned Dusenberry.

"All right, Cap; your owner's been waiting for you for a week. You're chartered to take a load of lime to Sands Point, and you got to hustle 'round and get your truck out or you'll lose it."

Later in the day three furniture wagons toiled up the ascending grade of Thirty-first street. From their sides and ends protruded

the tops and arms of antique chairs, loose bits of rugs, brass lamps, mattresses, rolls of matting, cooking utensils, boxes, barrels, crates, pictures, canvases, easels, and awning-poles. They were followed by four individuals who seemed to act as a body-guard. Three of these

wore knickerbockers; the fourth a sombrero of unusual size. All were sunburnt to a light chocolate brown. As the procession disappeared over the brow of the hill, it left the impression on the mind of the observer that the party was homeless but had rescued its traps.

"H. H.'S" GRAVE.

GOD, for the man who knew Him face to face
Prepared a grave apart, a tomb unknown,
Where dews drop tears, and only winds make moan,
And white archangels guard the narrow space.
God gives to His beloved sleep; the place
Where His seer slept was set remote, for rest,
After the forty years of desert quest,
The Sinai terrors, and the Pisgah grace.
So, clear-eyed priestess, sleep! remembering not
The fiery scathe of life, nor trackless years;
Not even Canaan's sun-kissed, flowery meads.
God shields, within His hollowed hand, the spot
Where brooding peace rebukes unquiet tears.
She sleepeth well who hath wrought such noble deeds!

IV.

"IS THAT YOU, BUD?"

MRS. STUCKY, making her way homeward through the gathering dusk, moved as noiselessly and as swiftly as a ghost. The soft white sand beneath her feet gave forth no sound, and she seemed to be gliding forward, rather than walking, though there was a certain awkward emphasis and decision in her movements suggesting something altogether human in their suggestions. The way was lonely. There was no companionship for her in the whispering sighs of the tall pines that stood by the roadside, no friendliness in the constellations that burned and sparkled overhead, no hospitable suggestion in the lights that gleamed faintly here and there from the windows of the houses in the little settlement. To Mrs. Stucky all was commonplace. There was nothing in her surroundings as she went towards her home to lend wings even to her superstition, which was eager to assert itself on all occasions.

It was not much of a home to which she was making her way — a little log-cabin in a pine thicket, surrounded by a little clearing that served to show how aimlessly and how hopelessly the lack of thrift and energy could assert itself. The surroundings were mean enough and squalid enough at their best, but the oppressive shadows of night made them meaner and more squalid than they really were. The sun, which shines so lavishly in that region, appeared to glorify the squalor, showing wild passion-flowers clambering

along the broken-down fence of pine-poles, and a wisteria vine running helter-skelter across the roof of the little cabin. But the night hid all this completely.

A dim, vague blaze, springing from a few charred pine-knots, made the darkness visible in the one room of the cabin, and before it, with his elbows on his knees and his chin in his hands, sat what appeared to be a man. He wore neither coat nor shoes, and his hair was long and shaggy.

"Is that you, Bud?" said Mrs. Stucky.

"Why, who'd you reckon it wuz, maw?" replied Bud, looking up with a broad grin that was not at all concealed by his thin sandy beard. "A body'd sorter think, ef they 'uz

ter ketch you gwine on that a-way, that you 'spected ter find some great somebody er nuth'er a-roostin' in here."

Mrs. Stucky, by way of responding, stirred the pine-knots until they gave forth a more satisfactory light, hung her bonnet on the bed-post, and seated herself wearily in a rickety chair, the loose planks of the floor rattling and shaking as she moved about.

"Now, who in the nation did you reckon it wuz, maw?" persisted Bud, still grinning placidly.

"Some great somebody," replied Mrs. Stucky, brushing her gray hair out of her eyes and looking at her son. At this, Bud could contain himself no longer. He laughed almost uproariously.

"Well, the great Jemimy!" he exclaimed, and then laughed louder than ever.

"Where've you been?" Mrs. Stucky asked, when Bud's mirth had subsided.

"Away over yander at the depot," said Bud, indicating Little Azalia. "An' I fotch you some May-pops too. I did that! I seed 'em while I waz a-gwine 'long, an' I sez ter myself, *seece*. You jess wait thar tell I come 'long back, an' I'll take an' take you ter maw,' says yee."

Although this fruit of the passion-flower was growing in profusion right at the door, Mrs. Stucky gave this grown man, her son, to understand that May-pops such as he brought were very desirable indeed.

"I wonder you didn't fergit 'em," she said.

"Who? me!" exclaimed Bud. "I jess like fer ter see anybody ketch me fergittin' 'em. Now I jess would. I never eat a one nuth'er—not a one."

Mrs. Stucky made no response to this, and none seemed to be necessary. Bud sat and pulled his thin beard and gazed in the fire. Presently he laughed and said:

"I jess bet a hoss you couldn't guess who I seed—now I jess bet that."

Mrs. Stucky rubbed the side of her face thoughtfully and seemed to be making a tremendous effort to imagine who Bud had seen.

"'Twer'n't no man en 'twern't no Azalia folks. 'Twuz a gal."

"A gal!" exclaimed Mrs. Stucky.

"Yes'n, a gal, an' *ef* she wa'n't a zooner you may jess take an' knock my chunk out."

Mrs. Stucky looked at her son curiously. Her cold gray eyes glittered in the firelight as she held them steadily on his face. Bud, conscious of this inspection, moved about in his chair uneasily, shifting his feet from one side to the other.

"'Twer'n't no Sal Badger," he said, after a while, laughing sheepishly; "'twern't no Maria Matthews, 'twern't no Lou Hornsby, an' 'twern't no Martha Jane Williams, nuth'er.

She wuz a bran'-new gal, an' she went ter the tavern, *she* did."

"I've done saw 'er," said Mrs. Stucky placidly.

"You done saw 'er, maw!" exclaimed Bud. "Well, the great Jemimy! What's her name, maw?"

"They didn't call no names," said Mrs. Stucky. "They jess sot thar an' gormandized on waffles an' batter-cakes, an' didn't call no names. Hit made me dribble at the mouf the way they went on."

"Wuz she purty, maw?"

"I sot an' looked at um," Mrs. Stucky went on, "an' I 'lowed maybe the war moughter come betwixt the old un an' her good looks. The t'other one looks mighty slick, but, Lordy! She hain't nigh ez slick ez that ar Lou Hornsby; yit she's got lot's purtier motions."

"Well, I seed 'er, maw," said Bud, gazing into the depths of the fireplace. "Atter the ingine come a-snortin' by, I jumped up behind the hack whar they puts the trunks, an' I got a right good glimp' un 'er, an' ef she hain't purty then I dunner what purty is. What'd you say her name wuz, maw?"

"Lordy, jess hark ter the creetur! Hain't I jess this minute hollered an' tole you that they hain't called no names?"

"I 'lowed maybe you moughter hearn the name named an' then drapt it," said Bud, still gazing into the fire. "I tell you what, she made thet ole hack look big, *she* did!"

"You talk like you er start crazy, Bud," exclaimed Mrs. Stucky, leaning over and fixing her glittering eyes on his face. "Lordy, what's she by the side er me? Is she made out'n i'on?"

Bud's enthusiasm immediately vanished, and a weak flickering smile took possession of his face.

"No'm—no'm! that she hain't made out'n i'on. She's lots littler'n you is—lots littler. She looks like she's sorry."

"Sorry! What fer?"

"Sorry fer we all."

Mrs. Stucky looked at her son with amazement not unmixed with indignation. Then she seemed to remember something she had forgotten.

"Sorry fer we all, honey, when we er got this great big pile er tavern vittles?" she asked with a smile, and then the two fell to and made the most of Mrs. Haley's charity.

At the tavern Helen and her aunt sat long at their tea, listening to the quaint gossip of Mrs. Haley, which not only took a wide and entertaining range, but entered into details that her guests found extremely interesting. Miss Tewksbury's name reminded Mrs. Haley of a Miss Kingsberry, a Northern lady, who had

taught school in middle Georgia, and who had "writ a sure enough book," as the genial landlady expressed it. She went to the trouble of hunting up this "sure enough" book, a small school dictionary, and gave many reminiscences of her acquaintance with the author.

In the small parlor, too, the ladies found General Garwood awaiting them, and they held quite a little reception, forming the acquaintance, among others, of Miss Lou Hornsby, a fresh-looking young woman who had an exclamation of surprise or a grimace of wonder for every statement she heard and for every remark that was made. Miss Hornsby also went to the piano and played and sang "Nelly Gray" and "Lily Dale" with a dramatic fervor that could only have been acquired in a boarding-school. The Rev. Arthur Hill was also there, a little gentleman whose side-whiskers and modest deportment betokened both refinement and sensibility. He was very cordial to the two ladies from the North, and strove to demonstrate the liberality of his cloth by a certain gayety of manner that was by no means displeasing. He seemed to consider himself one of the links of sociability, as well as master of ceremonies, and he had a way of speaking for others that suggested considerable social tact and versatility. Thus, when there was a lull in the conversation, he started it again, and imparted to it a vivacity that was certainly remarkable, as Helen thought. At precisely the proper moment, he seized Miss Hornsby and bore her off home, tittering sweetly as only a young girl can, and, the others following the example thus happily set, left Helen and her aunt to themselves, and to the repose that tired travelers are supposed to be in need of. They were not long in seeking it.

"I wonder," said Helen, after she and her aunt had gone to bed, "if these people really regard us as enemies?"

This question caused Miss Tewksbury to sniff the air angrily.

"Pray, what difference does it make?" she replied.

"Oh, none at all," said Helen. "I was just thinking. The little preacher was tremendously gay. His mind seemed to be on skates. He touched on every subject but the war, and that he glided around gracefully. No doubt they have had enough of war down here."

"I should hope so," said Miss Tewksbury. "Go to sleep, child; you need rest."

Helen did not follow this timely advice at once. From her window she could see the constellations dragging their glittering procession westward, and she knew that the spirit of the night was whispering gently in the tall pines, but her thoughts were in a whirl. The

scenes through which she had passed and the people she had met were new to her, and she lay awake and thought of them until at last the slow-moving stars left her wrapped in sleep, a sleep from which she was not aroused until William shook the foundations of the tavern with his melodious bell, informing everybody that the hour for breakfast had arrived.

Shortly afterwards, William made his appearance in person, bringing an abundance of fresh, clear water. He appeared to be in excellent humor.

"What did you say your name is?" Helen asked. William chuckled, as if he thought the question was in the nature of a joke.

"I'm name' Willum, ma'm, en my mammy, she name' Sa'er Jane, en de baby, she name' Phillypeener. Miss 'Ria, she say, dat baby is de likeliest nigger baby w'at she y'ever been see sence de war, en I speck she is kaze Miss 'Ria aint been talk dat away 'bout eve'y nigger baby w'at come 'long."

"How old are you?" Miss Tewksbury inquired.

"I dunno'm," said William, placidly. "Miss 'Ria, she says I'm lots older dan w'at I looks ter be, en I speck dat's so, kaze mammy say dey got ter be a runt 'mongst all folks's famblies."

Helen laughed, and William went on:

"Mammy say ole Miss gwine come see you all. Mars Peyt' gwine bring 'er."

"Who is old Miss?" Helen asked. William gazed at her with unfeigned amazement.

"Dunner who ole Miss is? Lordy! you de fus' folks w'at aint know ole Miss. She Mars Peyt's own mammy, dat's who she is, en ef she come lak dey say she comin', hit'll be de fus' time she y'ever sot foot in dish yer tavern less'n 'twuz indurance er de war. Miss 'Ria say she wish ter goodness ole Miss 'ud sen' word ef she gwine stay ter dinner so she kin fix up somepin n'er nice. I dunno whe'er Miss Hallie comin' er no, but ole Miss comin', sho, kaze I done been year um sesso."

"And who is Miss Hallie?" Helen inquired, as William still lingered.

"Miss Hallie — she — dunno'm, ceppin' she des stays dar 'long wid um. Miss 'Ria say she mighty quare, but I wish turrer folks wuz quare lak Miss Hallie."

William staid until he was called away, and at breakfast Mrs. Haley imparted the information which, in William's lingo, had sounded somewhat scrappy. It was to the effect that General Garwood's mother would call on the ladies during their stay. Mrs. Haley laid great stress on the statement.

"Such an event seems to be very interesting," Helen said rather dryly.

"Yes'm," said Mrs. Haley, with her peculiar emphasis, "it rather took me back when

I heard the niggers talkin' about it this mornin'. If that old lady has ever darkened my door, I've done forgot it. She's mighty nice and neighborly," Mrs. Haley went on, in response to a smile which Helen gave her aunt, "but she don't go out much. Oh, she's nice and proud — Lord, if pride 'ud kill a body, that old 'oman would 'a' been dead too long ago to talk about. They're all proud — the whole kit and b'lin'. She mayn't be too proud to come to this here tavern, but I know she aint never been here. The preacher used to say that pride drives out grace, but I don't believe it, because that 'ud strip the Garwoods of all they've got in this world; and I know they're just as good as they can be."

"I heard the little negro boy talking of Miss Hallie," said Helen. "Pray, who is she?"

Mrs. Haley closed her eyes, threw her head back, and laughed softly.

"The poor child!" she exclaimed. "I declare I feel like cryin' every time I think about her. She's the forlornest poor creetur the Lord ever let live, and one of the best. Sometimes, when I git tore up in my mind, and begin to think that everything's wrong-end foremost, I jess think of Hallie Garwood, and then I don't have no more trouble."

Both Helen and her aunt appeared to be interested, and Mrs. Haley went on:

"The poor child was a Herndon — I reckon you've heard tell of the Virginia Herndons. At the beginning of the war she was married to Ethel Garwood, and, bless your life, she hadn't been married mor'n a week before Ethel was killed. 'Twa'n't in no battle, but jess in a kind of skirmish. They fotch him home, and Hallie come along with him, and right here she's been ev'ry sence. She does mighty quare. She don't wear nothin' but black, and she don't go nowhere less'n it's somewheres where there's sickness. It makes my blood run cold to think about that poor creetur. Trouble hits some folks and glances off, and it hits some and thar it sticks. I tell you what, them that it gives the go-by ought to be monst'ous proud."

This was the beginning of many interesting experiences for Helen and her aunt. They managed to find considerable comfort in Mrs. Haley's genial gossip. It amused and instructed them, and at the same time gave them a standard, half-serious, half-comical, by which to measure their own experiences in what seemed to them a very quaint neighborhood. They managed in the course of a very few days to make themselves thoroughly at home in their new surroundings, and, while they missed much that tradition and literature had told them they would find, they found much to excite their curiosity and attract their interest.

One morning, an old-fashioned carriage, drawn by a pair of heavy-limbed horses, lumbered up to the tavern door. Helen watched it with some degree of expectancy. The curtains and upholstery were faded and worn, and the panels were dingy with age. The negro driver was old and obsequious. He jumped from his high seat, opened the door, let down a flight of steps, and then stood with his hat off, the November sun glistening on his bald head. Two ladies alighted. One was old, and one was young, but both were arrayed in deep mourning. The old lady had an abundance of gray hair that was combed straight back from her forehead, and her features gave evidence of great decision of character. The young lady had large, lustrous eyes, and the pallor of her face was in strange contrast with her somber drapery. These were the ladies from Waverly, as the Garwood place was called, and Helen and her aunt met them a few moments later.

"I am so pleased to meet you," said the old lady, with a smile that made her face beautiful. "And this is Miss Tewksbury. Really, I have heard my son speak of you so often that I seem to know you. This is my daughter Hallie. She doesn't go out often, but she insisted on coming with me to-day."

"I'm very glad you came," said Helen, sitting by the pale young woman after the greetings were over.

"I think you are lovely," said Hallie, with the tone of one who is settling a question that had previously been debated. Her clear eyes from which innocence, unconquered and undimmed by trouble, shone forth, fastened themselves on Helen's face. The admiration they expressed was unqualified and unadulterated. It was the admiration of a child, but the eyes were not those of a child. They were such as Helen had seen in old paintings, and the pathos that seemed part of their beauty belonged definitely to the past.

"I lovely?" exclaimed Helen in astonishment, blushing a little. "I have never been accused of such a thing before."

"You have such a beautiful complexion," Hallie went on placidly, her eyes still fixed on Helen's face. "I had heard — some one had told me — that you were an invalid. I was so sorry." The beautiful eyes drooped, and Hallie sighed gently.

"My invalidism is a myth," Helen replied, somewhat puzzled to account for the impression the pale young woman made on her. "It is the invention of my aunt and our family physician. They have a theory that my lungs are affected and that the air of the pine-woods will do me good."

"Oh, I hope and trust it will," exclaimed Hallie, with an earnestness that Helen could trace to no reasonable basis but affectation. "Oh, I do hope it will. You are so young — so full of life."

"My dear child," said Helen, with mock gravity, "I am older than you are — ever so much older."

The lustrous eyes closed, and for a moment the long, silken lashes rested against the pale cheek. Then the eyes opened and gazed at Helen appealingly.

"Oh, impossible! How could that be? I was sixteen in 1862."

"Then," said Helen, "you are twenty-seven, and I am twenty-five."

"I knew it — I felt it!" exclaimed Hallie, with pensive animation.

Helen was amused and somewhat interested. She admired the peculiar beauty of Hallie, but the efforts of the latter to repress her feelings, to reach, as it were, the results of self-effacement, were not at all pleasing to the Boston girl.

Mrs. Garwood and Miss Tewksbury found themselves on good terms at once. A course of novel-reading, seasoned with reflection, had led Miss Tewksbury to believe that Southern ladies of the first families possessed in a large degree the Oriental faculty of laziness. She had pictured them in her mind as languid creatures, with a retinue of servants to carry their smelling-salts, and to stir the tropical air with palm-leaf fans. Miss Tewksbury was pleased rather than disappointed to find that Mrs. Garwood did not realize her idea of a Southern woman. The large, lumbering carriage was something, and the antiquated driver threatened to lead the mind in a somewhat romantic direction, but both were shabby enough to be regarded as relics and reminders rather than as active possibilities.

Mrs. Garwood was bright and cordial, and the air of refinement about her was pronounced and unmistakable. Miss Tewksbury told her that Dr. Buxton had recommended Azalia as a sanitarium.

"Ephraim Buxton!" exclaimed Mrs. Garwood. "Why, you don't tell me that Ephraim Buxton is practicing medicine in Boston? And do you really know him? Why, Ephraim Buxton was my first sweetheart!"

Mrs. Garwood's laugh was pleasant to hear, and her blushes were worth looking at as she referred to Dr. Buxton. Miss Tewksbury laughed sympathetically but primly.

"It was quite romantic," Mrs. Garwood went on, in a half-humorous, half-confidential tone; "Ephraim was the school-teacher here, and I was his eldest scholar. He was young and green and awkward, but the best-hearted,

the most generous mortal I ever saw. I made quite a hero of him."

"Well," said Miss Tewksbury, in her matter-of-fact way, "I have never seen anything very heroic about Dr. Buxton. He comes and goes and prescribes his pills like all other doctors."

"Ah, that was forty years ago," said Mrs. Garwood, laughing. "A hero can become very commonplace in forty years. Dr. Buxton must be a dear, good man. Is he married?"

"No," said Miss Tewksbury. "He has been wise in his day and generation."

"What a pity!" exclaimed the other. "He would have made some woman happy."

Mrs. Garwood asked many questions concerning the physician who had once taught school at Azalia, and the conversation of the two ladies finally took a range that covered all New England, and, finally, the South. Each was surprised at the remarkable ignorance of the other; but their ignorance covered different fields, so that they had merely to exchange facts and information and experiences in order to entertain each other. They touched on the war delicately, though Miss Tewksbury had never cultivated the art of reserve to any great extent. At the same time there was no lack of frankness on either side.

"My son has been telling me of some of the little controversies he had with you," said Mrs. Garwood. "He says you fairly bristle with arguments."

"The general never heard half my arguments," replied Miss Tewksbury. "He never gave me an opportunity to use them."

"My son is very conservative," said Mrs. Garwood, with a smile in which could be detected a mother's fond pride. "After the war, he felt the responsibility of his position. A great many people looked up to him. For a long time after the surrender we had no law and no courts, and there was a great deal of confusion. Oh, you can't imagine! Every man was his own judge and jury."

"So I've been told," said Miss Tewksbury.

"Of course you know something about it, but you can have no conception of the real condition of things. It was a tremendous upheaval coming after a terrible struggle, and my son felt that some one should set an example of prudence. His theory was, and is, that everything was for the best, and that our people should make the best of it. I think he was right," Mrs. Garwood added with a sigh, "but I don't know."

"Why, unquestionably!" exclaimed Miss Tewksbury. She was going on to say more; she felt that here was an opening for some of her arguments, but her eyes fell on Hallie, whose pale face and somber garb formed a

curious contrast to the fresh-looking young woman who sat beside her. Miss Tewksbury paused.

"Did you lose any one in the war?" Hallie was asking softly.

"I lost a darling brother," Helen replied.

Hallie laid her hand on Helen's arm, a beautiful white hand. The movement was at once a gesture and a caress.

"Dear heart!" she said, "you must come and see me. We will talk together. I love those who are sorrowful."

Miss Tewksbury postponed her arguments, and, after some conversation, the visitors took their leave.

"Aunt Harriet," said Helen, when they were alone, "what do you make of these people? Did you see that poor girl and hear her talk? She chilled me and entranced me."

"Don't talk so, child," said Miss Tewksbury; "they are very good people, much better people than I thought we should find in this wilderness. It is a comfort to talk to them."

"But that poor girl," said Helen. "She is a mystery to me. She reminds me of a figure I have seen on the stage or read about in some old book."

When Azalia heard that the Northern ladies had been called on by the mistress of Waverly, that portion of its inhabitants which was in the habit of keeping up the forms of sociability made haste to follow her example, so that Helen and her aunt were made to feel at home in spite of themselves. General Garwood was a frequent caller, ostensibly to engage in sectional controversies with Miss Tewksbury, which he seemed to enjoy keenly; but Mrs. Haley observed that, when Helen was not visible, the general rarely prolonged his discussions with her aunt.

The Rev. Arthur Hill also called with some degree of regularity, and it was finally understood that Helen would at least temporarily take the place of Miss Lou Hornsby as organist of the little Episcopal church in the tackey settlement, as soon as Mr. Goolsby, the fat and enterprising book agent, had led the fair Louisa to the altar. This wedding occurred in due time, and was quite an event in Azalia's social history. Goolsby was stout, but gallant, and Miss Hornsby made a tolerably handsome bride, notwithstanding a tendency to giggle when her deportment should have been dignified. Helen furnished the music, General Garwood gave the bride away, and the little preacher read the ceremony quite impressively, so that, with the flowers and other favors, and the subsequent dinner, which Mrs. Haley called an "in-fair," the occasion was a very happy and successful one.

Among those who were present, not as invited guests, but by virtue of their unimportance, were Mrs. Stucky and her son Bud. They were followed and flanked by quite a number of their neighbors, who gazed on the festal scene with an impressive curiosity that cannot be described. Pale-faced, wide-eyed, statuesque, their presence, interpreted by a vivid imagination, might have been regarded as an omen of impending misfortune. They stood on the outskirts of the wedding company, gazing on the scene apparently without an emotion of sympathy or interest. They were there, it seemed, to see what new caper the townspeople had concluded to cut, to regard it solemnly, and to regret it with grave faces when the lights were out and the fantastic procession had drifted away to the village.

The organ in the little church was a fine instrument, though a small one. It had belonged to the little preacher's wife, and he had given it to the church. To his mind, the fact that she had used it sanctified it, and he had placed it in the church as a part of the sacrifice he felt called on to make in behalf of his religion. Helen played it with uncommon skill — a skill born of a passionate appreciation of music in its highest forms. The Rev. Mr. Hill listened like one entranced, but Helen played unconscious of his admiration. On the outskirts of the congregation she observed Mrs. Stucky, and by her side a young man with long sandy hair, evidently uncombed, and a thin stubble of beard. Helen saw this young man pull Mrs. Stucky by the sleeve and direct her attention to the organ. Instead of looking in Helen's direction, Mrs. Stucky fixed her eyes on the face of the young man and held them there, but he continued to stare at the organist. It was a gaze at once mournful and appealing — not different in that respect from the gaze of any of the queer people around him, but it affected Miss Eustis strangely. To her quick imagination, it suggested loneliness — despair, that was the more tragic because of its isolation. It seemed to embody the mute, pent-up distress of whole generations. Somehow Helen felt herself to be playing for the benefit of this poor creature. The echoes of the wedding-march sounded grandly in the little church, then came a softly played interlude, and finally a solemn benediction, in which solicitude seemed to be giving happiness a sweet warning. As the congregation filed out of the church, the organ sent its sonorous echoes after the departing crowd — echoes that were taken up by the whispering and sighing pines and borne far into the night.

Mrs. Stucky did not go until after the lights were out, and then she took her son by the hand, and the two went to their lonely cabin

not far away. They went in and soon had a fire kindled on the hearth. No word had passed between them, but after awhile, when Mrs. Stucky had taken a seat in the corner and lit her pipe, she exclaimed:

"Lordy! what a great big gob of a man! I dunner what on the face er the yeth Lou Hornsby could 'a' been a-dreamin' about. From the way she's been a-gigglin' aroun' I'd 'a' thought she'd 'a' sot her cap fer the giner'l."

"I say it!" said Bud, laughing loudly. "Whatter you reckon the giner'l 'ud 'a' been a-doin' all that time? I see 'er now, a-gigglin' an' a-settin' 'er cap fer the giner'l. Lordy, yes!"

"What's the matter betwixt you an' Lou?" asked Mrs. Stucky grimly. "'Taint been no time senst you wuz a-totin' water fer her ma, an' a-hangin' aroun' whilst she played the music in the church thar." Bud continued to laugh. "But, Lordy!" his mother went on, "I reckon you'll be a-totin' water an' a-runnin' er'n's fer thish yer Yankee gal what played on the organ up thar jess now."

"Well, they haint no tellin'," said Bud, rubbing his thin beard reflectively. "She's mighty spry 'long er that 'origin, an' she's got mighty purty han's an' mighty nimble fingers, an' ef she 'uz ter let down her ha'r, she'd be plum ready ter fly."

"She walked home wi' the giner'l," said Mrs. Stucky.

"I seed 'er," said Bud. "He sent some yuther gals home in the carriage, an' him an' the Yankee gal went a-walkin' down the road. He humped up his arm this away, an' the gal tuck it, an' off they put." Bud seemed to enjoy the recollection of the scene, for he repeated, after waiting awhile to see what his mother would have to say — "Yes, siree! she tuck it, an' off they put."

Mrs. Stucky looked at this grown man, her son, for a long time without saying anything, and finally remarked with something very like a sigh:

"Well, honey, you neenter begrudge 'em the'r walk. Hit's a long ways through the san'."

"Lordy, yes'n!" exclaimed Bud with something like a smile; "it's a mighty long ways, but the giner'l had the gal wi' 'im. He jess humped up his arm, an' she tuck it, an' off they put."

It was even so. General Garwood and Helen walked home from the little church. The road was a long but a shining one. In the moonlight the sand shone white, save where little drifts and eddies of pine-needles had gathered. But these were no obstruction to the perspective, for the road was an avenue, broad and level, that lost itself in the distance

only because the companionable pines, interlacing their boughs, contrived to present a background both vague and somber — a background that receded on approach, and finally developed into the village of Azalia and its suburbs.

Along this level and shining highway Helen and General Garwood went. The carriages that preceded them, and the people who walked with them or followed, gave a sort of processional pomp and movement to the gallant Goolsby's wedding — so much so, that if he could have witnessed it, his manly bosom would have swelled with genuine pride.

"The music you gave us was indeed a treat," said the general.

"It was perhaps more than you bargained for," Helen replied. "I suppose everybody thought I was trying to make a display, but I quite forgot myself. I was watching its effect on one of the poor creatures near the door — do you call them tackies?"

"Yes, tackies. Well, we are all obliged to the poor creature — man or woman. No doubt the fortunate person was Bud Stucky. I saw him standing near his mother. Bud is famous for his love of music. When the organ is to be played, Bud is always at the church, and sometimes he goes to Waverly and makes Hallie play the piano for him while he sits out on the floor of the veranda near the window. Bud is quite a character."

"I am so sorry for him," said Helen gently.

"I doubt if he is to be greatly pitied," said the general. "Indeed, as the music was for him, and not for us, I think he is to be greatly envied."

"I see now," said Helen, laughing, "that I should have restrained myself."

"The suggestion is almost selfish," said the general gallantly.

"Well, your nights here are finer than music," Helen remarked, fleeing to an impersonal theme. "To walk in the moonlight, without wraps and with no sense of discomfort, in the middle of December, is a wonderful experience to me. Last night I heard a mocking-bird singing, and my aunt has been asking Mrs. Haley if watermelons are ripe."

"The mocking-birds at Waverly," said the general, "have become something of a nuisance under Hallie's management. There is a great flock of them on the place, and in the summer they sing all night. It is not a very pleasant experience to have one whistling at your window the whole night through."

"Mrs. Haley," remarked Helen, "says that there are more mocking-birds now than there were before the war, and that they sing louder and more frequently."

"I shouldn't wonder," the general assented.

"Mrs. Haley is quite an authority on such matters. Everybody quotes her opinions."

"I took the liberty the other day," Helen went on, "of asking her about the Ku Klux."

"And pray, what did she say?" the general asked with some degree of curiosity.

"Why, she said they were like the shower of stars—she had heard tell of them, but she had never seen them. 'But,' said I, 'you have no doubt that the shower really occurred!'"

"Her illustration was somewhat unfortunate," the general remarked.

"Oh, by no means," Helen replied. "She looked at me with a twinkle in her eyes and said she had heard that it wasn't the stars that fell, after all."

Talking thus, with long intervals of silence, the two walked along the gleaming road until they reached the tavern, where Miss Eustis found her aunt and Mrs. Haley waiting on the broad veranda.

"I don't think he is very polite," said Helen, after her escort had bade them good-night and was out of hearing. "He offered me his arm, and then, after we had walked a little way, suggested that we could get along more comfortably by marching Indian file."

Mrs. Haley laughed loudly. "Why, bless your innocent heart, honey! that aint nothin'. The sand's too deep in the road, and the path's too narrer for folks to be a-gwine along yarm-in-arm. Lord! don't talk about perliteness. That man's manners is somethin' better'n perliteness."

"Well," said Helen's aunt, "I can't imagine why he should want to make you trudge through the sand in that style."

"It is probably an output of the climate," said Helen.

"Well, now, honey," remarked Mrs. Haley, "if he ast you to walk wi' 'im', he had his reasons. I've got my own idee," she added with a chuckle. "I know one thing—I know he's monstrous fond of some of the Northron folks. Aint you never hearn how, endurin' of the war, they fotch home a Yankee soldier along wi' Hallie's husband an' buried 'em side by side? They tell me that Hallie's husband an' the Yankee was mighty nigh the same age an' had a sorter favor. If that's so," said Mrs. Haley, with emphasis, "then two mighty likely chaps was knocked over on account of the everlastin' nigger."

All this was very interesting to Helen and her aunt, and they were anxious to learn all the particulars in regard to the young Federal soldier who had found burial at Waverly.

"What his name was," said Mrs. Haley, "I'll never tell you. Old Prince, the carriage driver, can tell you lots more'n I can. He foun' 'em on the groun' an' he fotch 'em

home. Prince use to be a mighty good nigger before freedom come out, but now he aint much better'n the balance of 'em. You all'll see him when you go over thar, bekaze he's in an' out of the house constant. He'll tell you all about it if you're mighty perlite. Folks is got so they has to be mighty perlite to niggers sence the war. Yit I'll not deny that it's easy to be perlite to old Uncle Prince bekaze he's mighty perlite hisself. He's what I call a high-bred nigger." Mrs. Haley said this with an air of pride, as if she were in some measure responsible for Uncle Prince's good breeding.

v.

It came to pass that Helen Eustis and her aunt lost the sense of loneliness which they had found so oppressive during the first weeks of their visit. In the people about them they found a never-failing fund of entertainment. They found in the climate, too, a source of health and strength. The resinous odor of the pines was always in their nostrils; the far, faint undertones of music the winds made in the trees were always in their ears. The provinciality of the people, which some of the political correspondents describe as distressing, was so genuinely American in all its forms and manifestations, that these Boston women were enabled to draw from it now and then a whiff of New England air. They recognized characteristics that made them feel thoroughly at home. Perhaps, so far as Helen was concerned, there were other reasons that reconciled her to her surroundings. At any rate, she was reconciled. More than this, she was happy. Her eyes sparkled, and the roses of health bloomed on her cheeks. All her movements were tributes to the buoyancy and energy of her nature. The little rector found out what this energy amounted to, when, on one occasion, he proposed to accompany her on one of her walks. It was a five-mile excursion, and he returned, as Mrs. Haley expressed it, "a used-up man."

One morning, just before Christmas, the Waverly carriage, driven in great state by Uncle Prince, drew up in front of the tavern, and in a few moments Helen and her aunt were given to understand that they had been sent for in furtherance of an invitation they had accepted to spend the holidays at Waverly.

"Ole Miss would 'a' come," said Uncle Prince, with a hospitable chuckle, "but she sorter ailin', en Miss Hallie, she dat busy dat she aint skacely got time fer ter tu'n 'roun'; so dey tuck'n sont atter you, ma'am, des like you wuz home folks."

The preparations of the ladies had already been made, and it was not long before they

were swinging along under the green pines in the old-fashioned vehicle. Nor was it long before they passed from the pine forests and entered the grove of live oaks that shaded the walks and drives of Waverly. The house itself was a somewhat imposing structure, with a double veranda in front, supported by immense pillars, and surrounded on all sides by magnificent trees. Here, as Helen and her aunt had heard on all sides, a princely establishment had existed in the old time before the war — an establishment noted for its lavish hospitality. Here visitors used to come in their carriages from all parts of Georgia, from South Carolina, and even from Virginia — some of them remaining for weeks at a time, and giving to the otherwise dull neighborhood long seasons of riotous festivity which were at once characteristic and picturesque. The old days had gone to come no more, but there was something in the atmosphere that seemed to recall them. The stately yet simple architecture of the house, the trees with their rugged and enormous trunks, the vast extent of the grounds — everything, indeed, that came under the eye — seemed to suggest the past. A blackened and broken statue lay prone upon the ground hard by the weather-beaten basin of a fountain long since dry. Two tall granite columns that once guarded an immense gateway supported the fragmentary skeletons of two colossal lamps. There was a suggestion not only of the old days before the war, but of antiquity — a suggestion that was intensified by the great hall, the high ceilings, the wide fireplaces, and the high mantels of the house itself. These things somehow gave a weird aspect to Waverly in the eyes of the visitors, but this feeling was largely atoned for by the air of tranquillity that brooded over the place, and it was utterly dispersed by the heartiness with which they were welcomed.

"Here we is at home, ma'am," exclaimed Uncle Prince, opening the carriage door and bowing low; "en yon' come ole Miss en Miss Hallie."

The impression which Helen and her aunt received, and one which they never succeeded in shaking off during their visit, was that they were regarded as members of the family who had been away for a period, but who had now come home to stay. Just how these gentle hosts managed to impart this impression, Helen and Miss Tewksbury would have found it hard to explain, but they discovered that the art of entertaining was not a lost art even in the piney woods. Every incident, and even accidents, contributed to the enjoyment of the guests. Even the weather appeared to exert itself to please. Christmas morning was ushered in with a sharp little flurry of snow. The

scene was a very pretty one, as the soft white flakes, some of them as large as a canary's wing, fell athwart the green foliage of the live oaks and the magnolias.

"This is my hour!" exclaimed Helen enthusiastically.

"We enjoy it with you," said Hallie simply.

During the afternoon the clouds melted away, the sun came out, and the purple haze of Indian summer took possession of air and sky. In an hour the weather passed from the crisp and sparkling freshness of winter to the wistful melancholy beauty of autumn.

"This," said Hallie gently, "is *my* hour." She was standing on the broad veranda with Helen. For reply, the latter placed her arm around the Southern girl, and they stood thus for a long time, their thoughts rhyming to the plaintive air of a negro melody that found its way across the fields and through the woods.

Christmas at Waverly, notwithstanding the fact that the negroes were free, was not greatly different from Christmas on the Southern plantations before the war. Few of the negroes who had been slaves had left the place, and those that remained knew how a Christmas ought to be celebrated. They sang the old-time songs, danced the old-time dances, and played the old-time plays.

All this was deeply interesting to the gentlewomen from Boston; but there was one incident that left a lasting impression on both, and probably had its effect in changing the future of one of them. It occurred one evening when they were all grouped around the fire in the drawing-room. The weather had grown somewhat colder than usual, and big hickory logs were piled in the wide fireplace. At the suggestion of Hallie, the lights had been put out, and they sat in the ruddy glow of the firelight. The effect was picturesque indeed. The furniture and the polished wainscoting glinted and shone, and the shadows of the big brass andirons were thrown upon the ceiling, where they performed a witch's dance, the intricacy of which was amazing to behold.

It was an interesting group, representing the types of much that is best in the civilization of the two regions. Their talk covered a great variety of subjects, but finally drifted into reminiscences of the war — reminiscences of its incidents rather than its passions.

"I have been told," said Miss Eustis, "that a dead Union soldier was brought here during the war and buried. Was his name ever known?"

There was a long pause. General Garwood gazed steadily into the fire. His mother sighed gently. Hallie, who had been resting her head against Helen's shoulder, rose from her chair and glided from the room as swiftly as a ghost.

HALLIE PLAYING FOR BED.

"Perhaps I have made a mistake," said Helen in dismay. "The incident was so strange——"

"No, Miss Eustis, you have made no mistake," said General Garwood, smiling a little sadly. "One moment——" He paused, as if listening for something. Presently the faint sound of music was heard. It stole softly from

the dark parlor into the warm firelight as if it came from far away.

"One moment," said General Garwood. "It is Hallie at the piano."

The music, without increasing in volume, suddenly gathered coherency, and there fell on the ears of the listening group the notes of an air so plaintive that it seemed like the break-

ing of a heart. It was as soft as an echo and as tender as the memories of love and youth.

"We have to be very particular with Hal-lie," said the general, by way of explanation. "The Union soldier in our burying-ground is intimately connected with her bereavement and ours. Hers is the one poor heart that keeps the fires of grief always burning. I think she is willing the story should be told."

"Yes," said his mother; "else she would never go to the piano."

"I feel like a criminal," said Helen. "How can I apologize?"

"It is we who ought to apologize and explain," replied General Garwood; "you shall hear the story, and then neither explanation nor apology will be necessary."

(To be continued.)

Joel Chandler Harris.

THE AMATEUR PHOTOGRAPHER.

THE subtle alchemy of the hobby has never worked more interesting results than in the case of the amateur photographer. That gentle madness which has given a triteness to the phrase "enthusiastic amateur," is especially engaging in

the person of one who has succumbed to the curious contagion of the camera. And there is something so communicable in this enthusiasm, that it behooves no one to regard the phenomenon with disrespectful flippancy. Who is to know that his best friend has not been taken down over night? In the street a man feels a hand upon his shoulder, and is served by Banks or Temple with a moral subpœna for a sitting.

Once acquired, the photographic passion is easily gratified. The inventive genius of the century seems to have conspired for its encouragement. The daintiest devices in wood and brass, the coyest lenses, the airiest tripods, the snuggest carrying-cases,—all seem especially endowed with that peculiar quality which tempts one who has straddled a new hobby to plant the spurs impetuously. A few years ago matters were very different. The keynote of amateur photography, the "dry-plate," has been supplied within eight or ten years, since the dry-plate process, though in use for more than a decade, was not brought to trustworthy perfection until it had undergone several seasons' trial. There were, indeed, "wet-plate amateurs," and there are to-day some who follow the example of many professionals in adhering to the older method. But amateur photography now practically means dry-plate photography. It was the amateur who welcomed the dry-plate at a time when the professional was yielding it only a cautious tolerance. Why he welcomed it may scarcely require explanation.

The principle of the wet-plate process is suggested by its name. The glass negative-plate is coated with collodion, exposed in the camera while wet, and developed at once. This implies the presence of appliances within a short distance of the place where the exposure is made. In order to make views out-of-doors the photographer was obliged to carry an outfit which in these times would look lugubriously elaborate. I have seen a "home-made" amateur wet-plate apparatus, made very ingeniously of telescoping boxes, with an eye-hole at the top, an arm-hole at each side, an orange-light window in the front (for all the tinkering with the moist plate had to be done without white, actinic light), and the whole, with its trays, baths, solutions in bottles, etc., could be reduced to a relatively small bundle.

When the dry-plate arrived it became possible to do away with all this ponderous machinery. The dry-plates, bought ready prepared, can be kept for months before use, and for months again after exposure before they are developed—a phenomenon of which the wonder is always new. Thus one may carry a camera with him through Europe, pack up the exposed plates, and, unless some custom-house official, to the amateur's unspeakable despair, insists upon opening a few of the packages to discern the meaning of their ominous weight, develop them all on his return home.

This element of portability is not the only feature of the dry-plate process which had an immediate influence upon the development of amateur photography. A capacity for rapid work was from the outset an important characteristic of the process. By continued experiment the sensitiveness of the gelatine film with which the plates are coated was from time to time increased, until now an exposure for the two-hundredth part of a second is sufficient to secure an adequate negative. The value of this achievement is wider than the field of the amateur. Within the few years during which instantaneous work has been possi-

A STREET FANT. TAKEN FROM A THIRD-STORY WINDOW BY J. WELLS CHAMPNEY.

ble, both science and art have increased their obligations to the camera. Every one remembers the burst of merriment and wonder that greeted Mr. Muybridge's pictures of the horse in motion. The motion of a sound-jarred lamp-flame, the flight of a cannon-shot, the forkings of lightning, and a thousand other phenomena have been dexterously photographed. Through this medium both the naturalist and the surgeon have gained a better knowledge of muscular action. One anatomist uses the rapid plate to settle the long-standing dispute as to whether, in the twirling of the fist, the *ulna* or the *radius* moves the more; another fastens with bee's-wax upon the line of a model's spine a row of glistening Christmas-tree balls, and then takes a dozen impressions within a second while the model is walking away from the operator. It is in this manner that instantaneous photography has made itself invaluable to students in many departments of knowledge, students who, while they are in a sense amateur photographers, make professional use of the product.

A novel result of the instantaneous process is seen in the camera without legs. "There is only one way to get along without a tripod," said a well-known New York photographer. "You must focus, and for this purpose a stick, inserted in the bottom of the camera and resting in the ground, might be used." After being assured by excellent authorities that the idea was absurd, Mr. William Schmid, of Brooklyn, N. Y., made the first of the "detective" cameras. Mr. Schmid is neither a professional photographer nor a mechanic, but a musician. Let me say behind a respectful parenthesis

that most of the improvements in modern photography have been discovered or instituted by amateurs. Working only for pleasure and attainment, the amateur thinks nothing of a risk. He indulges in most unorthodox measures, violating recognized rules of procedure, and with bewildering impunity. Then, the amateur blunders. To blunder is to discover, though it is infinitely more pleasurable to have the other fellow do the discovering. With his client waiting without to learn the result of the sitting, the professional cannot afford to discover at this price.

The "detective" solved several problems. Focusing, which is a simple matter of arithmetic, was accomplished with a lever. In order to discover the field of the lens and the situation of the image on the plate, a small camera obscura was fitted in the front of the box; and a perforated disk of black rubber made the exposure in a space of time ranging between the thirty-fifth and the one-hundred-and-thirtieth part of a second. Nothing connected with photography has proved so fascinating as this "detective" camera. Disguised in a small, inconspicuous box, which might readily be taken for a professional hand-satchel, it is indeed a "witch-machine," as it was named last summer by an astonished resident of the Tyrol, when, under its inventor's arm, it was winking its way through some of the quaintest towns of Europe. In the open air nothing is closed against the "detective." In the rigging of a tossing ocean steamer, or in a crowd on the Bowery, it is always prepared, with one eye open and the other shut. Fragments of street scenery, little *genre* bits in out-of-the-way corners, tableaux in rustic or town life, requiring instant capture, all impossible to the ordinary camera, are caught by the "detective" in their very effervescence.

In the hands of police officials the "detective" has justified its name. It has already several times figured in court proceedings, and may well be regarded with uneasiness by those whose face is not their

A "HOME-MADE" WET-PLATE OUTFIT.

MABEL. (TAKEN BY ALEXANDER BLACK.)

fortune. An English detective is described as having disguised himself as a bootblack and hidden a camera in a foot-box, with results very gratifying to the Police Department and very bewildering to the rogues.

Several varieties of the "detective," or portable, camera are in the market. Then there is the "vest camera," consisting of a false vest in which one of the false buttons forms the neck of the lens. For stealing portraits the arrangement is very ingenious, and ought to prove a valuable assistant to the caricaturist. The pictures, though small, are sometimes surprisingly good. Again, a German has secreted a camera in the hat. An ostensible ventilating aperture in the front is the eye-hole of the lens.

For larger and more serious work the portable camera is, of course, inadequate. Probably the favorite size of camera with experienced amateurs is the camera fitted for 5×8

inch plates. The size has, after all, little to do with the value of the result. Wisdom dictates the utility of a modestly small camera at the outset. In sizes larger than 5×8 inches, or 6½×8½ inches,—another useful size,—plates become somewhat expensive playthings. The discovery that negatives can be made with gelatine-coated paper, which is placed on rollers and reeled, panorama-like, at the back of the camera, has opened up interesting possibilities to the photographer.

Vastly more important than the precise size of the box is the character of the lens, upon which the quality of the photograph is wholly dependent. In his selection of a lens every shrewd amateur is careful; but as every shrewd amateur is not shrewd when he buys his first lens, it is not inadvisable to emphasize at all times the prudence, whatever the cost of the outfit, of spending at least half of the sum on

the lens; to say two-thirds of the sum would be stating a better rule.

But out-of-door apparatus is no bugbear to the amateur. So far as the camera and its immediate appliances go, no difficulty is commonly found in getting just what is needed, provided the buyer does not stake his happiness on the first camera that is shown him, without looking over the series of later inventions.

Photography indoors and the processes of the dark-room have not so many ready-made features as picture-making in the open air. The dark-room problem must be solved

of the plates is deferred until the evening (a common practice), the precautions for excluding light will be to a great extent unnecessary.

Whether simply or elaborately treated, the dark-room is certain to remain a "matter in difference" between the photographer and the head of the domestic bureau. Whether he has an apartment dedicated to his uses, or an impromptu den evolved from the bath-room and an assortment of blankets and shawls, the amateur incurs a liability to feminine displeasure, and must find his own way of offering propitiation. In case the photographer is of the other sex (a possibility of which the chances

ON THE MIAMI CANAL. (TAKEN BY J. D. SMITH.)

at the very beginning. The photographer must find some place in the house from which all light can be excluded, and where there is, if possible, running water. "I would like photography a good deal better," said a Boston lawyer the other day. "if my attic ceiling didn't slope so suddenly." It is not so much that attics are apt to have a forty-five degree emphasis, as that the absorbed operator, working with a dim light, forgets all about the slope. A permanent dark-room is probably the exception among amateurs, who are generally able to find a room or the corner of a room which may be pressed into service during the time developing is going on. If the development

daily become interestingly greater), woman's superiority over the domestic forces upon which it is necessary to rely will come into play to her benefit.

In making pictures indoors, the illumination, instead of being managed by nature, as out-of-doors, must be managed by the photographer. In the house, unless the amateur has a roof-opening of some sort, securing the "top light" of the professional, portraits and groups must be made with only the side light of windows. This unfavorable angle of light must be overcome by the use of reflectors, which may consist of an adjustable white screen, or have the unpremeditated pictur-

ROSE OF SHARON. (TAKEN BY GEORGE E. WOOD.)

esqueness of a sheet thrown over a clothes-horse. One of the first enterprises an amateur essays is the photographing of an interior. In this way he characteristically begins at the most difficult end of the art. Nothing is more precarious than photographing an interior. The windows, which supply the light, are the source of the greatest anxiety, since they themselves generally require only the short exposure given a landscape, while the dim interior demands an exposure perhaps fifty times as long. To overcome this difficulty, windows coming within the range of the lens must be covered carefully until a sufficient exposure has been given to the rest of the room. The cap is then replaced, the window coverings removed, and a short exposure given the whole.

An interior may often be photographed to advantage by gas-light. The chief obstacle in the way of success by this method is that of keeping the source of light out of the range of the lens. Several hours may be required to make a satisfactory negative, but the result will be an ample reward. A New York publisher, who can show a handsome series of negatives, once undertook to photograph his library by gas-light. So that there might be no possibility of intrusion, he did not set his camera until ten o'clock in the evening, and concluded to leave the cap off for two hours. On that night his daughter was going to an evening party. He asked her when she would be home. "At twelve o'clock, sir," she replied with readiness. There was obviously no

reason why the publisher should sit up; his daughter understood the cap arrangement thoroughly. "Maggie," he said, "when you come home you will find my camera set in the library. Go in and put on the cap and turn off the gas." The next day the publisher developed the plate. It was a complete failure, horribly over exposed; scarcely an object was discernible. "Maggie!" called the publisher from the door of his den, in tones that forbade equivocation, "*what time did you get home?*" "At—three o'clock, sir," said Maggie.

Portraits and all amateur indoor pictures are liable to have this characteristic of deep shadows, so repugnant to the business photographer.

bicyclist screws a jaunty, elfin camera upon the cross-bar of his wheel; the canoeist stows one in his locker.

Transparencies and lantern slides are readily made from negatives, and are a special hobby with many amateurs. Chicago has formed a Lantern Slide Club, evidently with a view to coöperation in this particular field. We shall doubtless soon hear of Composite Clubs, since composite portraiture has completely subjugated the amateur. A thrill of excitement is occasionally caused by the announcement that some one has photographed in color; the truth being that some one has a new scheme for the photographing of color.

ON THE WAY FROM SCHOOL. (TAKEN BY WILLIAM SCHMIDT.)

Yet these are the strong lights and shades the artist loves. The effect is warmer, more individual, than in the so-called "well-lighted" portrait or interior. I have seen portraits that left a little too much to the imagination; there is a happy mean.

In many other respects amateur work has its own special charm. Freed from the commercial necessities which fetter the professional, the amateur need have nothing but the principles of art for guidance. In this delicious liberty he well may be, and is, envied by those who must yield something to the whim of the buyer, and who have a hard fight with the Philistines in every effort to elevate the standard of their art.

The amateur has an opportunity to infuse individuality into his products,—one is expert at portraiture; another at landscape; a third is noted for his city types and localities; a fourth takes up with natural-history subjects; a fifth with yachts and water views; the

Isochromatic, orthochromatic, or axioscopic photography, as we may agree to term it, has drawn a great deal of attention of late from all who for any reason are interested in photography. The Germans have made great progress in the *farben-empfindliche* ("color-sensitive") methods. In the United States science and art have been placed under obligations to Mr. Ives, of Philadelphia, who has completely mastered the hitherto insurmountable difficulty of gaining in a photograph the relative color values of the objects photographed.

A New York physician, the windows of whose house overlook the East River from the bluff on the east side of the city, is too busy to go after subjects, but lets his subjects, like his patients, come to him. At the window of an upper room in his house he has a camera set with a drop-shutter,—used for instantaneous work,—carefully adjusted. From his easy-chair in the consulting-room on the lower floor he can look out on the river, can see the

PORTRAIT OF A CHILD. (TAKEN BY ALEXANDER BLACK.)

plebeian river craft crawling and smoking upon the water, and every afternoon may watch the self-important Sound steamers churning their way past the indifferent small fry of the stream. When one of these autocrats of the Sound or some other floating object of importance looms within the range of the lens, the doctor may touch an electric button near his inkstand, and upstairs at the window that little shutter-guillotine bites off a square inch of light, which carries the image to the sensitive plate at the back of the camera. After office hours the doctor goes up and takes out the plate.

The curiously diverse *personnel* of amateur photography* includes a large number of active physicians. It is worthy of note that the profession of medicine seems to foster the cultivation of hobbies. How great a debt art owes to the fact that Dr. Haden began playing with the etching needle! Some of our prominent Eastern merchants have gone into photography in a characteristically sumptuous way, fitting up luxurious sky-light rooms, and adding to the dark-room equipment every mechanical comfort money may buy. A Massachusetts parson, who loves to drive a decorously fast team, has a cluster of prints illustrating the

charming region through which he makes his Monday tours. A Brooklyn Court stenographer can reveal the vagaries of the police station and the Black Maria. It is, perhaps, not essential to the unity of this sketch that I should mention, as illustrating a phase of the subject, a hospital steward at the Sandwich Islands who took up with photography for the purpose of practicing on the leprosy patients; or the Canadian sheriff who added the tortures of an unwilling pose to the misery of a batch of prisoners who were about to be hanged!

The rapid growth of amateur photography is forcibly indicated by the number and size of the amateur photographic societies. All the large and many of the smaller cities have now one or more associations of this sort.

Many New York amateurs are associated with the Photographic Section of the American Institute. The Columbia College Amateur Photographic Society finds a leading spirit in Professor Chandler. The Society of Amateur Photographers, of New York, organized four years ago, is now a large and prosperous organization, holding annual exhibitions and awarding diplomas for the best examples of work in different fields. The Society's influence has had the effect of elevating the artistic standard not only of amateur photography, but of photographic art in general. At the semi-monthly meetings the members discuss with frankness the experiments they have made, relate their mild vicissitudes, describe their blunders and the resultant discoveries. No one is ashamed that he should have made mistakes. An amateur who had no failures would be regarded as a sort of artistic snob. As an off-set to this variety, where it exists, there is generally the humorous fellow whose plates always either "fog" or "frill," whose prints freckle, and who, when he insists on "silvering" his own paper, gets a little nitrate of silver on the end of his nose, where it promptly blushes brown on meeting the sun, and can only be removed, if it must be removed at once, with pumice-stone or sand-paper.

The "Field Day" has become an institution with the amateur societies, and woe to the sensitive who get in the path of one of these armed bodies! On these excursions the member with the "detective" usually has his best sport in practicing on the other members, who, at the moment of a photographic crisis, are not always so impressive as they themselves could wish.

What a flow of "developer" after one of these country tours! Far into the night, perhaps, the trays are rocking, and the lanterns dimly flickering; and in quarters, mayhap,

* The Tzar is said to be one of the growing company of Russian amateurs; the Prince of Wales, President of the Amateur Photographic Association of

Great Britain, has acquired much expertness with the camera, and royal sanction has elsewhere, it seems, been very heartily given.

that were hard to secure and duly transform. Country side and sea shore know the amateur photographer, his practices, and his needs. We cannot believe that the country boarding-

house, certainly not the well-regulated hotel of the future, will neglect to incorporate in its table of attractions, "Improved Dark-room for Amateur Photographers."

Alexander Black.

THE CAMERA CLUB OF CINCINNATI.

ONE evening in January, 1884, in response to a circular letter of invitation issued by Mr. Gilmore and the writer, some eight or ten amateurs met at the house of the former in Cincinnati and determined to form the Camera Club. After some discussion of the subject and a luncheon, washed down by a cool beverage which Cincinnati thinks she can make better than Milwaukee, a committee on organization was appointed, and we adjourned subject to the call of our chairman, a worthy doctor of medicine, when our committee should be ready to report. After some ineffectual efforts to ascertain what the older clubs formed for a similar purpose had done, our committee decided to "go it alone," and proceeded to draw a constitution and by-laws providing for officers, members, meetings, excursions, and lantern-exhibitions, the exclusion of professional photographers, the admission of

others, males, interested in the gentle art of light-writing, and further providing for many minor matters which have long since been forgotten by the framers of that organic law of the club. So much having been accomplished, we had a second meeting at a law office in Fountain Square, and the Camera Club there came into an actual, if not a legal, existence—it having been decided not to apply for the statutory articles of incorporation.

The constitution provided for an election of officers by ballot and upon notice, but the club at once proceeded to an election by acclamation; and although the constitution was thus shattered within a few moments of its adoption, the Camera Club has flourished and prospered and grown to a membership of some fifty persons, who meet from time to time in a well-fitted club-room, and have lantern shows and excursions whenever they see fit.

IN THE FOREST AT SHEPHERD HILL. PLACES BY DAVID W. H. HUNTINGTON.

The club-room is on the top floor of a large building on Fourth street. There is no elevator, and the stairways are high — but the rent is low.* Climbing the stairways, we enter a large room well lighted by three windows and a sky-light on its northern side. The camera, the screens, the head-rests, and the tables littered with lenses, plate-holders, and printing-frames give the room the appearance of a photographic gallery. The many pictures on the walls, however, are the pictures of amateurs. Technically they rival the best professional work, but in subject they are entirely different; for the professional must necessarily consider what is salable; the amateur need only consider what is picturesque.

The professional, traveling for a railway company, for example, will secure as many rails and telegraph-poles as possible; the amateur in going over the same ground will leave the railway out.

A large frame on the club-room wall contains the prize pictures of the field contest of 1885. Another frame contains a number of pictures of an old mill on the Kentucky River, from the same negative, but printed on different kinds of paper, showing a variety of the modern printing processes.

The dark-room adjoins the gallery and is large and spacious. It is well lighted with two windows glazed with ruby glass and screened by yellow curtains. Beneath the windows there is a long sink with several faucets flanked by small barrels of "Hypo" and alum and numerous shelves containing the necessary chemicals and many trays and glass graduates. On a table are the scales, and a gas stove with its kettles for making the "hot solutions." The dark-room is approached by means of double doors with an intervening dark lobby, so that members can go in or out without admitting a single ray of white light.

The image formed on the plate can, as we have observed, be developed at any time. The latent image is developed by pouring upon the plate any one of the number of simple chemical solutions, the receipts for which come with the plates. This must be done in the semi-darkness of the dark-room, as the plate is, of course, still sensitive to light. The actinic ray of light, it has been ascertained, is that farthest from the ray of heat, and the red ray has but little effect upon the sensitive plates. In the rosy twilight of the dark-room, the plates (which perhaps have received an image months ago in Florida or California) are placed in trays and the developing solution poured on. In a few seconds the picture begins to appear. First come the sky, the

water, and the lighter objects, and these are soon followed by the deeper shadows of the foliage. It is an interesting process and smacks, indeed, of necromancy.

In the month of February, when the Camera Club was but a month old, the great floods in the Ohio Valley came. The river at Cincinnati reached the highest point it has ever attained, and came rushing through the streets of the city, bringing ruin and destruction to many houses and families, but affording a rare opportunity for a photographic contest between the amateurs and their professional brethren. Every camera in town was at the river front, or cruising about the flooded streets; and it is but fair to state that the work of the amateurs on this occasion compared favorably with that of the professionals. The amateurs, too, being ready with their instantaneous shutters, secured the only animated picture of that remarkable event.

Since the organization of the Camera Club the regular meetings have been well attended. Almost any day at noon several members may be found in the dark-room developing plates or instructing each other in the magic of the photographic art.

Early in the summer of 1884 we had our first annual outing. A small river steamboat, the *Silver Star*, was chartered, and at eight o'clock left the wharf with a jolly and enthusiastic crowd, notwithstanding a dark and gloomy morning. As we steamed away down the placid stream which divides the North from the South, the smoke hung low upon the river; it seemed to grow darker and threatened rain. The camera-boxes and tripods remained unpacked on the cabin floor, and we sat about in groups and "talked about the weather." "Wake up, boys," said the secretary; "I never yet saw the day I couldn't make a picture."

"Yes," said his companion, "we made some good pictures of the flood while it was raining."

"The plates are so sensitive," remarked the professor, "that with a large stop I have no doubt we may get some instantaneous pictures, for the river, you know, reflects most of the light."

Then our artist claimed there was a softness about pictures made under a cloudy sky and that the sun made sharp and disagreeable contrasts, and a younger member disrespectfully remarked, in an undertone, something about sour grapes. But as the secretary was recognized as an authority, his confidence was reassuring; we accepted the situation, and were soon at work.

A passing steamboat, with its dense clouds of black smoke waving astern, caused a scrambling for the forward deck, and one camera

*The club has since taken quarters with the Society of Natural History—the fixtures are the same.

went overboard, but was fortunately rescued. A picnic boat, with flying flags and crowded decks, was the occasion of a similar scene; but as none of her portraits have ever appeared in the club-room, it is fair to presume that the light was insufficient, the aim bad, or something happened in the hurry of the moment. The secretary, availing the crowded deck, erected his tripod by a cabin window, and secured an instantaneous picture of some fishing-boats as our steamboat passed them.

The artist sat upon the forward deck smoking his cigar and scanning the banks of the river for some unusually picturesque spot. A bit of country road on the Kentucky shore having caught his eye, he persuaded the committee of arrangements to make a landing, and our little craft was soon made fast among some drift-wood and willows. The artist, with his servant-model carrying his Blair box, climbed the steep river bank to the picturesque roadway. Some sought the shaded path on the hillside, others remained among the willows on the shore.

The *Silver Star* was ordered to cruise about within easy range while the secretary gave the professor some practical lessons in instantaneous photography, and nearly every drop-shutter in the ranks was let fly at her. At noon we landed at Short Hill, a fine old country-seat owned by one of the club-men, who, with his two young boys, met us at the landing. Our luncheon was served upon the lawn, and before we had finished eating, the "engineer" had a

clever group which he entitled "The Club at Work," and which, upon the screen, won the plaudits of the audience at the lantern exhibition last winter. In the afternoon we continued our cruise to the mouth of the Great Miami, and at evening returned well laden with something over a hundred exposed plates, most of which made fine negatives.

During the summer many of the club-men left the city, and all made good use of their cameras. In the autumn the travelers returned with many pictures of many places. The sec-

retary, by means of a pneumatic tube and shutter, had succeeded in including himself in most of his pictures. A fair sample of his work is his "Quail shooting in Kansas." In this "autophotograph" (if I may coin a word) the secretary stands in the foreground of his picture and his dogs are pointing the birds, some of which a moment later, upon the closing of the camera-shutter, fell to the guns.

The secretary declares that next year he will shoot a bird and photograph it in the air before it falls; and no doubt he will, for he has already in practice "bagged" the fragments of a clay pigeon.

"The Diver" is a clever instantaneous shot made by a club-man who went down by the sea. This picture is not only remarkable for the short time in which it was taken, but it is a beautiful bit of landscape, with some salt-grass and two boats in the middle distance and a few sloops lying at anchor just beyond, — a little out of focus perhaps, but for that reason all the more sketchy and artistic.

A MOUNTAIN RANCH. (TAKEN BY H. F. FARNY.)

The artist wandered away to the far Northwest and brought back, besides his color sketches, many photographs of Indians, cowboys and plain-men, ranches, prairie, badlands, sage-bush, and everything, in fact, which an artist could see in the wilds of Montana. One member returning from Newport brought many pictures of the sea, yachts under full sail, armed vessels of the navy, craft of all sorts, and charming marine pictures which would delight a painter. Others came from Lake George and the Adirondacks, with grand

views of lake and mountain with foregrounds full of summer friends and picturesque coaches and canoes.

In the autumn and winter others who went to the South returned with the light-writings of a Southern sun, including an occasional "drop-shutter" picture from the hotel window.

In the winter the club had its first lantern exhibition. For weeks prior to that event the club-rooms were a scene of activity, the members all being engaged in reducing their negatives to small positives on glass for exhibition on the screen. A committee of judges, having with the aid of a lantern tested the hundreds of slides offered, selected enough for an evening's entertainment, to which the friends of the club were invited, and one of the members described the pictures as they were thrown

upon the screen. All the slides exhibited were made by club-men from their own negatives.

Upon our second outing several detective cameras made their appearance, and they have become a popular and very fatal weapon, and there will probably be many persons at our next lantern show who are unaware that they have had their pictures taken.

Such is an outline of the history and more important doings of the Camera Club. Since this article was written the American Clubs have arranged for an interchange of their lantern exhibitions, and the London Club annually exchanges two hundred lantern pictures for a similar number from the Associated American Clubs.

Dwight W. Huntington.

THE DIVER. (TAKEN BY JOHN L. STETTINIUS.)

NOBLESSE OBLIGE.

WHAT is diviner than the peace of foes !
 He conquers not who does not conquer hate,
 Or thinks the shining wheels of heaven wait
 On his forgiving. Dimmer the laurel shows
 On brows that darken ; and war-won repose
 Is but a truce when heroes abdicate
 To Huns—unfabling those of elder date
 Whose every corse a fiercer warrior rose.
 O ye that saved the land ! Ah yes, and ye
 That bless its saving ! Neither need forget
 The price our destiny did of both demand—
 Toil, want, wounds, prison, and the lonely sea
 Of tears at home. Oh, look on these. And yet—
 Before the human fail you—quick ! your hand !

Robert Underwood Johnson.

THE DIGESTIBILITY OF FOOD.

THE CHEMISTRY OF FOODS AND NUTRITION. IV.

"We live upon, not what we eat, but what we digest."—MEINERT.

"Now good digestion wait on appetite, and health on both."—MACBETH.

We have been talking of the different kinds of nutritive substances of food and the ways in which they nourish our bodies, but have thus far omitted one of the very important factors of their nutritive value, their digestibility. The value of food for nutriment depends not only upon how much of nutrients, protein and fats and the like, it contains, but also upon how much of these the body can digest and use for its support.

The question of the digestibility of foods is very complex, and I have noticed that the men who know most about the subject are generally the least ready to make definite and sweeping statements concerning it. One of the most celebrated physiologists of the time, an investigator who has, I suppose, devoted as much experimental study to this particular subject as any man now living, declares that, aside from the chemistry of the process, and the quantities of nutrients that may be digested from different foods, he is unable to affirm much of anything about it. The contrast between this and the positiveness with which many people discourse about the digestibility of this or that kind of food, is very marked and has its moral.

One source of confusion is the fact that, what people commonly call the digestibility of food includes several very different things; some of which, as the ease with which a given food-material is digested, the time required for the process, the influence of different substances and conditions upon digestion, and the effects upon comfort and health, are so dependent upon individual peculiarities of differ-

ent people, and so difficult of measurement, as to make the laying down of hard and fast rules impossible. Why it is, for instance, that some persons are made seriously ill by so wholesome a material as milk, and others find that certain kinds of meat, of vegetables, or of sweetmeats, "do not agree with them," neither chemists nor physiologists can exactly tell. Late investigations, however, suggest the possibility that the ferments in the digestive canal may, with some people, cause particular compounds to be changed into injurious and even poisonous forms, so that it may sometimes be literally true that "one man's meat is another man's poison."*

But digestion proper, by which we understand the changes which the food undergoes in the digestive canal in order to fit the digestible portion to be taken into the blood and lymph and do its work as nutriment, is essentially a chemical process. About this a great deal has been learned within a comparatively few years, so that here again we have many important facts that have not yet got into current literature. In explaining about them perhaps it will not be out of the way to repeat some of the things we learned in studying chemistry and physiology. We will start with the facts that the first thing the body does with the food is to digest it; that the digestion is done in that long irregular shaped piece of apparatus—laboratory is perhaps a better word—which consists of mouth, œsophagus, stomach, and intestines, and which is called the alimentary canal; that it is next converted into blood; that to get into the blood it must pass through the sides, the walls, of this canal; and that it is only after the food has been digested

* We are hearing a great deal of late about poisons in food containing protein compounds, such as the casein of milk and the myosin of lean meat and fish. The protein compounds are prone to decay, that is, to be decomposed by the action of the ferments called bacteria or microbes. In certain forms of decomposition, substances of a more or less poisonous nature, called ptomaines, are formed from protein. It appears to be in this way that poisonous compounds are formed in cheese, meats, etc. While the true digestive ferments, such as the ptyalin of saliva and pepsin of gastric juice, are very different from the ferments just spoken of, yet microbes exist in the digestive apparatus of even the

healthiest people, and within a short time past it has been found that poisonous compounds, formed probably by the action of microbes, often occur within our bodies. The natural inference—it is not positively proved, I think—is that there may be cases in which the protein of certain kinds of food is thus transformed into injurious substances while passing through the alimentary canal. Perhaps this is the reason why certain persons cannot endure milk without pain or nausea, and it is not impossible that many of the cases in which one kind of food or another causes sickness, may, in the light of future research, be attributed to such fermentations within the body.

and has worked its way into the blood and lymph that it can be distributed through the body and made into tissue, stored for future use, or burned for fuel.

I doubt if most of us realize what an amount of chemical activity the stomach and intestines must put forth, what a wonderful laboratory that must be which transforms our food into the constituents of blood. The average man swallows, say, six pounds of food and drink, meat, potatoes, bread, coffee, milk, water, and what not, per day. Every twenty-four hours, then, all the solid substance, all the protein, fats, carbohydrates, and mineral matters of this quantity of food, except the small portion that passes through the alimentary canal undigested, must be either dissolved or divided into such minute particles as to be able to get through the microscopic passages that permeate the walls of the alimentary canal, and thus find their way to the blood.

THE CHEMISTRY OF DIGESTION.

PROFESSOR MALY very aptly compares food to ore, and the nutriment we digest from it to the metal extracted from the ore. In the chemical laboratory we sometimes separate a metal from the earthy matters with which it is mingled by pulverizing the ore, putting it in a flask, pouring acids upon it, and stirring the whole together. The acids dissolve the metal, leaving a residue of earthy matters undissolved. To separate the dissolved materials from the residue, we pour the whole upon a paper filter. The solution runs through the interstices of the paper into a dish below, leaving the undissolved residue in the filter.

Something analogous to this takes place in the digestion of food. Instead of the metal and earthy matters of the ore, we have the digestible and the undigestible constituents of meat, or bread, or other food. The grinding is done, not by pestle and mortar, but by the teeth; the digestive juices are the solvents; in the place of the flask the dissolving is done in the digestive apparatus, the stomach and intestine. Finally, the digested material has to pass, not through a filter, but through the porous walls of these last organs. The changes which the digestive juices cause are manifold. The saliva with its ptyalin transforms the insoluble starch of bread and potatoes into soluble sugar. The pepsin of the gastric juice supplied by the stomach and the trypsin of the pancreatic juice which comes from the pancreas, convert the myosin of meat, the casein of milk, the albumen of egg, the gluten of wheat, and other protein compounds of the food into soluble peptones. The gall acts upon the oily and fatty matters,

besides doing other duties. As the food in process of digestion is gradually propelled along the intestine, still another fluid, the intestinal juice, acts upon it. In these and other ways more or less perfectly understood, the digested matters are either dissolved or otherwise altered so that they can filter into the blood (though the process is different from ordinary filtration), and be thus conveyed to all parts of the body.

IN the first of the quotations at the beginning of this article, a German student of food-economy gives terse expression to the fact that we are nourished by that part of the food which is actually digested. To judge accurately of the nutritive value of our food, then, we must know how much of each nutrient will be digested. This is a matter that can be determined more or less accurately by experiment. But a great deal of labor is needed to make the experiments accurate, the line of research is new, the methods are not yet perfectly matured, and the results thus far obtained, though interesting and valuable when taken together, are still very far from complete. The side questions, such as differences in the digestive apparatus of different persons, the effects of exercise and rest, or the mode of preparation of the food, and of the flavoring materials and beverages taken with it, tend to complicate the problem and make satisfactory results still harder to obtain. Yet even here experimental research has something to tell us.

The ways in which the experiments to test the digestibility of foods are made are very ingenious and interesting. Physiologists use the salivary glands or stomach or intestine of a living animal much as chemists do their bottles and retorts and test tubes. One easily gets into the way of regarding an animal as simply an organism manifesting certain reactions under given conditions, and in not a few European laboratories a janitor is readily induced by the price of a few months' supply of beer, or a student by his scientific ardor, to take this same altruistic view of his own physical organism. In the German laboratories, particularly, one finds not only the needed apparatus, but, what is no less important, trained assistants and servants, so that he is relieved of much of the time-consuming and disagreeable detail of experimenting, which is so much of an obstacle with us.

THE QUANTITIES OF DIGESTIBLE SUBSTANCES IN FOOD.

THE first of our questions may be put in this way: What proportion of each of the nutrients in different food-materials is actually

digestible? In a piece of meat, for instance, what percentages of the total protein and fats will be digested by a healthy person, and what proportion of each will escape digestion?

The proportions of food-constituents digested by domestic animals has been a matter of active investigation in the European agricultural experiment stations during the past twenty years. Briefly expressed, the method consists in weighing and analyzing both the food consumed and the intestinal excretion. Since the latter represents the amount of food undigested, if we subtract it from the whole amount taken into the body the difference will be the amount digested.

Such experiments upon human subjects, however, are rendered much more difficult by the fact that in order that the digestibility of each particular food-material may be determined with certainty, we must avoid mixing it with other materials. Hence the diet during the experiments must be so plain and simple as to make it extremely unpalatable. An ox will live contentedly on a diet of hay for an indefinite time, but for an ordinary man to subsist a week on meat or potatoes or eggs is a very different matter. No matter how palatable such a simple food may be, at first, to a man used to the ordinary diet of a well-to-do community, it will almost certainly become repugnant to him after a few days. In consequence, the digestive functions are disturbed, and the accuracy of the trial is impaired, a fact, by the way, which strikingly illustrates the importance of varied diet in civilized life.

For instance, in one of a series of experiments conducted in the physiological laboratory at Munich, by Dr. Rubner, the subject, a strong, healthy Bavarian laborer, lived for three days upon bread and water, a diet, the monotony of which was much more endurable than one of meat or fish or almost any other single food-material would have been. He was able to eat 1185 grams (about 2 lbs. and 10 oz.) of bread per day. This contained 670 grams of carbohydrates, mainly starch, of which only about 5 grams, or a little less than one per cent., escaped digestion. In this case, therefore, about 99 per cent. of the carbohydrates of the bread was digested. The bread contained 81 grams of protein, of which 13 per cent. was undigested and 87 per cent., or $\frac{7}{8}$ of the whole protein, digested. The quantity of fatty matters in the bread was too small to permit an accurate test of their digestibility. In another series, conducted by myself in the same laboratory, the digestibility of meat in the form of beefsteak, and of fish, haddock, was tested. The subject, a medical student, consumed less than two pounds of meat per day, and though it was cooked with butter, pepper,

salt, and onions, so as to make it to his taste, "extraordinarily well flavored," it was very difficult for him to swallow it the second day, and required still greater effort the third. The digestion, however, seemed to be normal, and all but about one per cent. of the protein was digested.* Other trials with meat have brought similar results, and it is reasonably safe to say that when a healthy person, with sound digestive organs, eats ordinary meat or fish in proper quantity, all or nearly all of the protein is digested. Some of the fats of meat, however, seem to fail of digestion.

The number of accurate experiments of this kind is still very small. Some sixty or thereabouts have been reported. Nearly all have been made within ten years past, and the majority in one laboratory, that of the University of Munich. Most of the subjects have been men with healthy digestive organs, two or three laboratory servants, a soldier, several medical students, and a few others. Several have been made, however, with children of a few families. All but a very small number have been conducted in Germany.

Digestibility of Nutrients of Food-materials.

In the food-materials below.	Of the total amounts of protein, fats, and carbohydrates, the following percentages were digested:		
	<i>Protein.</i>	<i>Fats.</i>	<i>Carbohy- drates.</i>
Meats and fish	Practically all	79 to 92	
Eggs	"	96	
Milk	88 to 100	93 to 98	?
Butter	"	98	
Oleomargarine	"	96	
Wheat bread	81 to 100	?	99
Corn (maize) meal	89	?	97
Rice	84	?	99
Pease	86	?	96
Potatoes	74	?	92
Beets	72	?	82

Some of the main results are summarized in the tabular statement herewith, and set forth graphically in the diagram on page 736. As there appears to be good ground for believing that in some cases in which the smaller percentages were digested the conditions were not entirely normal, I have omitted them in making the calculations for the table and diagram. Thus, in the diagram it is assumed that all of the protein of milk is digestible, though in some experiments part was left undigested. The methods of experimenting do not permit absolute accuracy, and the results with different persons and with different specimens of the same food-material vary somewhat. The greatest errors in the estimates in the table and chart are probably in the fats, which may be more completely digested than the figures imply.

* *Zeitschrift für Biologie*, XV. and XXIV.

Percentages indicated by Shaded Bands.

The quantities digested represent, in some cases, the average results of several experiments; in others, the outcome of only a single trial. Though the experimental data are, as yet, meager, these proportions are probably not far from correct. The digestion of the fats, however, may be more complete than here represented.

Quantities less than 0.5 per cent. are not shown in the shaded bands. The tabular statement below gives numerical details.

	PROTEIN.		FATS.		CARBOHY-DRATES.		MINERAL MATTERS.	WATER.		PROTEIN		FATS.		CARBOHY-DRATES.		MINERAL MATTERS.	WATER.

Though the experimental data are as yet very meager, so much so that no account is taken of the digestibility of the food-materials in the estimates for potential energy in the previous article, nor for estimates of dietaries in succeeding ones, the figures here given are probably not far out of the way as indicating the proportions digested by healthy persons.

The amounts of fat in the vegetable foods are so small that the experiments do not tell exactly what proportions are digested. The meats and fish contain practically no carbohydrates. The digestibility of the carbohydrates (sugar) or milk was not determined, those of the vegetable foods, except the beets, were almost completely digested. That the protein of cows' milk should be so much less completely digested than that of meat seems a little strange. Children have been found to digest a little more than adults, though the difference is not large. Thus Dr. Camerer, a German experimenter, found his boys and girls of from 2 to 12 years of age, digested from 91 to 97 per cent. of the protein of cows' milk, while grown men in experiments by Dr. Rubner digested from 88 to 94 per cent. But in experiments in which milk and cheese were eaten together by a man, the laboratory servant of Dr. Rubner's experiments, all or nearly all of the protein of both was digested. Dr. Rubner suggests an explanation of the more nearly complete digestion of the milk when taken with cheese than when taken by itself alone. When taken into the stomach without anything else, cows' milk is apt to coagulate in large lumps which resist the action of the digestive juices. The particles of cheese, if finely chewed and mixed with the milk, would prevent the formation of such large lumps, and it would thus be more readily and completely digested. This seems very reasonable. The percentage of fats of milk digested was practically the same with adults as with children. It is worth noting that in these experiments both children and adults digested only about half of the mineral salts of the milk. Why so much of the fats of the meat, from a twelfth to a fifth, should have failed to be digested, it is not easy to say.

Much has been said and written about the relative digestibility of butter and oleomargarine. The only actual comparative tests on record are a series made with a man and boy by Professor Mayer, in Holland. In these from 97.7 to 98.4 per cent. of the fat of the butter and from 96.1 to 96.3 per cent. of the fat of the oleomargarine were digested. The average difference was 1.6 per cent. in favor of the butter. Certain possible sources of error in such experiments make it a question whether the digestion was not in fact more nearly complete than even these figures make it.

An interesting series of experiments in artificial digestion conducted by Dr. R. D. Clark, in behalf of the New York Dairy Commission, though of course not affording a definite measure of the process as it actually goes on in the body, accords with the very natural supposition that, in ease, and perhaps in completeness of digestion, oleomargarine would rank between butter and the fat of ordinary meat.

In chemical composition oleomargarine stands between meat-fat and butter. It will be remembered that oleomargarine is made from beef-fat and lard by removing from them part of the stearin, which counts as the least digestible ingredient, and adding a little butter and sometimes oil, as cotton-seed oil. The bulk of all these fatty substances, meat-fat, butter, and oil, consists of the same or nearly the same kinds of fat, the meat-fat having the more stearin. The butter, however, contains small quantities, seven per cent. or thereabouts, of peculiar fats, butyrim, caproin, etc., which give it its flavor and which are thought by some to make it more easily digestible, especially by persons whose digestion is enfeebled by lack of digestive juices or otherwise.

In the excitement over oleomargarine legislation, the discussion of the relative digestibility of butter and butter substitutes has been made very active by the importance of its bearing upon their comparative values for nutriment, and many statements have been made as to the effect of the chemical composition of the peculiar butter-fats and the consequent chemical changes in the process of digestion and assimilation in the body. It is interesting to compare the very positive inferences which some writers upon the subject draw from experimental investigations, with the very guarded expressions of opinion made by the authors of the same investigations in their writings and in personal conversation. The facts at hand and the general impression of special students of these subjects, so far as I have observed, are to the effect that probably, for healthy persons, the difference between butter and oleomargarine in ease and in completeness of digestion would be at most very slight, but that for people with enfeebled digestion and for infants, butter may, perhaps, at times, have the advantage.

When we consider that the quantity of butter which one would naturally use on a slice of bread would, roughly speaking, be about as large as that of the fat which would remain in a corresponding slice of lean, juicy beef after the larger particles of fat had been trimmed off, it is hard to believe that the difference in digestibility or nutritive value between the butter and the same quantity of oleomargarine could be of very great moment.

Some of the food-materials referred to in the table on page 735 and in the diagram as meat, bread, and milk, have been tested, each by several experiments with more than one person. With others, as eggs, corn-meal, rice, pease, and potatoes, only a single trial has been made. Doubtless, extended series of tests would give averages differing more or less from these figures. Another thing that makes the results a little uncertain is that some of the food-materials may perhaps be more completely digested when taken in small quantities with other materials, in the ordinary way, than when so much of them is eaten and without any other food. These and other sources of slight error make more extended experiments very desirable. I should add that the figures for mackerel, in the diagram, are only estimates, based upon experiments with haddock (the only kind of fish that has been tested experimentally), and with meats.

EFFECTS OF DIFFERENT CIRCUMSTANCES UPON THE DIGESTION OF FOOD.

THE estimates in the table and diagram apply to the quantities of nutrients digested, from wholesome and properly cooked and masticated food, by healthy persons. But the ease and time of digestion and the fitness of the digested matters for the user, are likewise very important considerations, and these as well as the proportions digested are more or less affected by the preparation of the food, the quantity consumed, and the materials eaten and drunk with it; by exercise and sleep; and by the bodily condition or peculiarities of digestive function of the person.

The effect of the preparation of food, especially of its cooking, is one of the many topics about which one can write with a freedom and fluency inversely proportional to his understanding of the known facts. The chief underlying principle is the same as in the dissolving of the ore of which I spoke above. If the particles of ore are large, the acid will act upon them very slowly. Stirring would hasten the solution of the soluble materials. Time would be needed for those that were slow to dissolve. So in the digestion of food, we cut our meat into small pieces and chew it into still finer ones; and the grains of wheat, which we cannot well chew, are first ground in the mill. Milk requires neither cooking nor chewing. Its nutrients are either already in solution or in very minute particles, it has no starch to be changed into sugar by the ptyalin or saliva, its only carbohydrate, milk sugar, being already a sugar and soluble; and we accordingly drink it raw. Ordinary meats are found by experiment to be digested as readily or even more readily when

taken raw than when cooked, provided they are properly masticated, *i. e.*, finely chewed. But we like their taste better, and hence are more inclined to masticate them properly, when well cooked.

Some interesting experiments on the rapidity of digestion of meats cooked and uncooked, and of milk, have been lately conducted by Herr Jensen, in the laboratory of the University of Tübingen. To test the effect of cooking, he took lean beef, chopped it fine, and separated the tendons and other connective tissue as completely as he could. A portion was left raw, other portions were boiled, and still others were roasted. Of the boiled and roasted portions, some were rare, or, as Herr Jensen called them, "half done," and others well done. The raw, half done, and well done portions were tested by artificial digestion with pepsin, by experiments in the stomach of a dog, and by experiments in the stomach of a healthy man.

In the experiments by artificial digestion Herr Jensen put the meat in glass tubes, poured a solution containing pepsin upon it, and kept the tubes with their contents in a warm place, at about the temperature of the body, for twenty-four hours, stirring the mixtures from time to time, thus imitating the operation that goes on in the stomach. The dog with which the experiments were made had metal tubes permanently inserted through the skin into the stomach, which could be opened or kept closed with a stopper at will. (I may remark in passing that a dog thus provided with a stomachic fistule is regarded as a very convenient item in the list of appliances of a physiological laboratory, and my limited observation of the behavior of the animals has left with me the decided impression that such ways of being useful to the world in their day and generation are much less distasteful to them than many anti-vivisectionists would have us think.) The meat was inclosed in a cloth, inserted through the tube, and removed after the desired time. In the experiments with the man, a laboratory servant, the food was taken into the stomach when the latter was empty, and, after digestion for the desired time, withdrawn by a stomach-pump.

The experiments all told nearly the same story. The raw meat was digested more readily than the cooked. In the trial by artificial digestion the residues unaltered by the pepsin were smallest with the raw meat and largest with that which had been most thoroughly cooked by boiling or roasting. In those with the man, the digestion was completed in different lengths of time, as set forth in the figures herewith, which I translate from Jensen's report.

Food	Time digested in
Raw	2 hours
Boiled, with water	1 1/2 ..
Boiled, without water	1 ..
Roasted, with water	3 ..
Roasted, without water	4 ..

In like manner, boiled milk required a somewhat longer time for digestion than milk not boiled.

These results and those of other experiments, though not to be taken as an exact measure of the digestibilities of the substances in a healthy stomach, are still the more worthy of confidence because they accord with the chemistry of the subject. But we must remember that they apply only to what takes place in the stomach; while the normal process of digestion goes on in the intestine after the food has left the stomach.

Some kinds of meat are very tough when raw and are made more tender by cooking. This is due, in part at least, to changes in the so-called connective tissue. The connective tissue of bone, tendons ("gristle"), hoofs, etc., is disintegrated and changed into gelatine or glue by steaming or boiling. In like manner, the minute portions of this material that are distributed through the meat, are softened and lose their tenacity, and thus tough meat is often made tender. But to do this, and to cook meat sufficiently, requires less heat and less outlay for fuel than many people suppose. A great saving can often be made by use of proper devices for cooking, as I hope to explain at another time.

Vegetable foods often require cooking to fit them for use. This is especially true of starchy foods, such as grains, wheat, corn, etc.; beans and pease; and potatoes. The starch is contained in cells. The outer covering of the cell is cellulose (woody-fiber), the material which constitutes the fiber of cotton and linen and which is used to make cloth and paper. If the particles of ore above referred to were incased with material which the acids could not easily penetrate, they would be very slow to dissolve. The digestive juices of the human body act very slowly upon cellulose, and for this reason the starch of raw potatoes or uncooked grain would be difficult of digestion. But in cooking, the little sacs of starch are burst open and the starch itself undergoes more or less chemical change, so that the ptyalin and other agents convert it much more readily into sugar or other digestible forms. But to get at the matter of the changes of food in cooking requires more discussion of the chemical principles involved than would be proper here.

In brief, so far as animal foods are concerned,

cooking is mainly a device to gratify the palate, but many vegetable foods require heating, with or without water, to fit them for use by man.

As to the effect of the quantity of food upon the proportion digested, the experiments at hand seem to point to the interesting conclusion that when a moderate amount is taken, it is digested more completely than a very large or, at times, even a very small quantity. So, likewise, a moderate amount of water seems favorable, while too much has been found to interfere with digestion.

A great deal is said and written about the effect exerted upon the digestion of food by food adjuncts, such as spice, mustard, and other flavoring materials; beef-tea and meat-extract; tea, coffee, chocolate, and similar beverages; and alcoholic drinks. Instead of venturing an opinion upon the subject which is rather physiological than chemical, I may more appropriately quote one of the latest authoritative utterances upon the subject. Professor Forster, a well-known experimenter, in speaking of what the Germans call *Genussmittel*—appetizers is perhaps the nearest corresponding word we have—the materials which we take with our food either for their own agreeable flavor or to improve the flavor of the food, and which are often supposed to help the digestion,—says in substance as follows:*

"There is no doubt that the human digestive apparatus can be excited to activity in various ways with *Genussmittel*, including such as are used by man in a refined civilization, at the beginning and end of his meals, e.g., meat broth, salt and salt condiments like caviar, cheese, etc. . . . We know that when brought into contact with the mucus membrane of the stomach and intestines of a living animal, they cause the filling of the blood-vessels and secretion of the digestive juices. Sugar and salt are hardly brought into the mouth before they excite abundant effusion of saliva. Indeed, the same effect is produced even by the sight or smell of savory foods, and some of the well-tasting substances may act upon the digestive apparatus and its glands by simply being taken into the blood circulation. Thus I have observed experimentally a rich secretion of gall after an injection of a solution of sugar into a vein (vena mesenterica). . . . It is very natural to infer from this that the work of digestion will go on better with the aid of such condiments than without them, in two ways: either more nutriment might be digested from the same food, or, if there were no increase in the amount digested, it might be digested more quickly with their help, which would likewise be a gain. . . . But, important as this may seem to physiologists, it is of minor consequence with healthy persons. Thus, in experiments made with a man under my direction, meat which had been treated with water [to remove the 'extractives' which give meat its flavor and which are the chief constituents of beef-tea and meat-extract] and was so tasteless as to be eaten in any considerable quantity only with difficulty, the quantity digested and observed to pass into

* In the volume on "Ernährung und Nahrungsmittel," of Pettenkofer and Ziemssen's "Handbuch der Hygiene," the latest standard German work on these subjects.

the circulation was as large as with the same weight of meat roasted in the ordinary way; and both Bischoff and Hofmann have found that meat-extract taken with bread or with a mixed diet did not materially affect the digestion. And in experiments by Flügge with a mixed diet so tasteless as to make it, when continued some time, extremely repugnant, so that great effort was required to eat it, the digestion seemed to be unaffected thereby.

"For the sick and convalescent, on the other hand, the effect of these appetizers upon the digestion is of great importance, especially where the digestive apparatus has been for a time more or less inactive and requires stimulating. Thus the observations of Kemerich show the usefulness of bouillon and meat-extract in case of enfeebled digestion."

In the case of the ore there must be plenty of acids or it cannot dissolve. If the supply of digestive juices is insufficient, the food cannot digest. The chief use of these food adjuncts would seem to be to stimulate the production of digestive juices. The results of later experimental research and the teachings of the physiologists whose opinions are most valued among their fellow-specialists seem, so far as I can gather, to be in the same line with the statements here quoted. It would thus appear that, while the materials which we call appetizers may often be very helpful where digestion is enfeebled, they are, for healthy people, superfluous and without special effect upon the utilization of food in the body. As regards the stronger stimulants, especially alcohol, the same class of physiologists, so far as I can gather from their writings and from personal conversation, are, in general, rather cautious in speaking of its effect upon digestion, but are nevertheless inclined to believe that it does under some circumstances help the digestion of food. There are experiments which indicate that alcohol, taken into the stomach in considerable quantities, may retard gastric digestion while it remains there, but that, on the other hand, it has a stimulating action upon the secretion of the digestive juices, so that it may materially aid digestion. Indeed, just as I write, a German journal brings account of late experiments by Gluzinski which accord with this view. That, when taken in moderate quantities, alcohol should thus help weak digestion, would, unless I err, be quite in accord with the best experimental testimony and with a common opinion of experimenters. Some of our strong temperance friends would

hardly second Paul's advice to Timothy to "use a little wine for thy stomach's sake," but the experimental physiologists seem to side with Paul. But, decidedly as thoughtful specialists may reject the extreme statements of some temperance agitators, many of them are very emphatic in their declarations concerning the danger of excessive use of alcohol and the evil which results from it.

Regarding the effect of moderate exercise just after eating, observations differ, some experiments indicating that muscular labor retards digestion, others that it does not. During sleep digestion has been found to be diminished. To consider the connection between the mental and physical condition and digestion would take us too far from our present purpose.

To recapitulate. In considering the digestibility of food we have to take into account (1) the quantity digested, and (2) the ease and time of digestion. As regards the quantities digested from reasonable amounts of ordinary food-materials by healthy people, the best experimental evidence indicates that:

First. The protein of our ordinary meats and fish is very readily and completely digestible.

Second. The protein of vegetable foods is much less digestible than that of animal foods. Of that of potatoes and beets, for instance, a third or more may escape digestion and thus be useless for nourishment.

Third. Much of the fat of animal food may at times fail of digestion.

Fourth. The carbohydrates, starch, sugar, etc., which make up the larger part of vegetable foods, are very digestible.

Fifth. The animal foods have in general the advantage of the vegetable foods, that they contain more protein, and that their protein is more digestible.

Sixth. The quantities digested appear to be less affected by flavor, flavoring materials, and food-adjuncts than is commonly supposed.

Concerning the ease and time of digestion, and consequent comfort and health, the lack of accurate experimental data renders it more difficult to make concise statements. Cooking and other conditions are very important. Very much depends upon the individual peculiarities of different people.

W. O. Atwater.

WOMAN AND ARTIST.

I THOUGHT to win me a name
Should ring in the ear of the world! —
How can I work with small pink fists
About my fingers curled?

Then adieu to name and to fame!
They scarce are worth at the best
One touch of this wet little, warm little mouth
With its lips against my breast.

Alice Williams Brotherton.

HELEN.

ASKED Helen if I could speak to her one moment. This was on Monday. Helen was in the hall—fastening a string around a bundle of magazines. Close by stood Elisabeth Stubbs, our parlor-maid,

with a basket. The basket contained a complete military suit and the very miscellaneous costume in which I attended to our furnace fire.

"No, Harry," said Helen, hurriedly, "I'm late now."

The house jarred with the closing of the street door. Helen was not a violent person. She was gentle as a lamb; but a lamb with seven magazines to distribute, and belated for a dress-rehearsal, cannot be compared to a lamb under ordinary circumstances.

Tuesday afternoon I made a second attempt. "Helen," I said, very decidedly, "I wish to ask you a question." We were again in the hall. Helen still wore the bonnet. I do not think she slept in it, although she always appeared with it on her head at breakfast. A bundle of German plays, very much out of the binding, replaced the magazines. That afternoon the military dress, my furnace suit, and Mildred Smith's brother's dress-coat were to figure among other costumes before the Tuesday German Club. Elisabeth Stubbs acted as dressing-maid in the green-room, and graciously told me later that my furnace suit looked awful funny on Miss Mildred Smith, who was some kind of a soap-man, and that the most beautiful part of the play was almost spoiled by young Mr. Smith, who came home and wanted his coat because he was going away in the train, and if it hadn't been for his mother he would have gone right on to the stage and asked for it, and that he was just horrid because he had to go off without it, and that Miss Helen told Miss Mildred that her brother Harry wouldn't have made any fuss at all.

Naturally Helen paid less attention to me this afternoon than the day before. In fact she did not seem to notice my presence, but repeated her rôle as she put on her gloves, and went out of the house saying, "Ich habe nur das eine Wort, ich liebe Sie." Wednesday I chose the hour of 7 P. M., judging that would be a moment of respite between the engagements of the day and the evening. I opened the parlor door and said—not very pleasantly—

"Helen! I wish you'd stop long enough to tell me ——" In the room sat a circle of ladies; one of them was saying, "I think each of the eight vice-presidents should pledge herself to twelve suits." Helen, with a book and a pencil in her hand, quietly shut the door in my face.

"What's in the parlor, Jane?" I asked the cook.

"Don't yer know, Mister Harry?" said Jane. "Sure it's the Injins as comes the first Wednesday in every month." Aunt Charlotte, warming her feet by the kitchen-range, explained, "It is the Indian meeting, Harry; something Helen has an interest in. I believe she is one of the vice-presidents, and chairman of the Press Committee."

"I told yer as how it was the Injins," came from the sink; "yer country aint treated thim well; there's a whole pile of *illigant* little pink papers about 'em up in Miss Helen's room. Fine names these chieftains got!—some of 'em much as three and four inches long."

"You didn't want the parlor just now, did you, Harry dear?" continued Aunt Charlotte. "I think you had better look at the furnace; the ladies used to meet in the church vestry, but it was too cold and damp; you know it's half under ground, Harry."

"Yes," I said.

"The sexton never built the fire until just before the meeting began, and I know it must have been colder there than in any Indian wigwam—that is why we thought the ladies had better meet here. You don't want your sister to take cold, Harry dear?"

"No; I did not want any of them to take cold."

Thursday I went down early to breakfast, determined to have my question answered. Elisabeth Stubbs, wearing an injured expression, stopped her work to inquire if Miss Helen were a Nihilist. It appeared that the postman had made this suggestion to our maid-servant.

My sister sat at the breakfast-table—her bonnet on. The pile of letters before her gave me a clew to the postman's attempted joke. Envelopes long, square, narrow, broad, white, blue, brown, buff; postmarks indicating remote towns in the United States; postmarks from Canada, England, France, Japan; a journal from Heidelberg, and a postal from Constantinople. Helen held communications with all parts of the world; she knew people everywhere; she belonged to several

societies whose work was carried on entirely through correspondence; she also wrote for various periodicals—the manuscripts were often returned, thereby largely increasing her mail. They were not returned, be it understood, from lack of merit; even Aunt Charlotte and I considered them good, and we were no exception to the rule of unappreciative families.

My sister looked at me absently—told me to order a barrel of flour sent that morning to the St. Margaret Orphan Asylum, asked Aunt Charlotte if she had slept well, and then hurriedly ran over a page of her note-book:

“Nine to ten, French reading; ten to eleven, see about Soldiers’ Monument; eleven to twelve, buy gingham for asylum; twelve to one, Diet mission; two to four, read paper at club; then see sick woman, tell people about change of place, and collect Magazine-club fees.”

Here I will explain that Helen was secretary of a club called “The Bohemians.” There were one hundred members, men and women, clever, charming, delightful people. They read “papers,” and talked on various art topics, and it was a great honor to be of them. One of their Bohemian ways was an occasional uncertainty as to the next place of meeting, and upon Helen rested the responsibility of informing one hundred people where this next place would be. This explains the brief little memorandum of “Tell people about change of place.”

“Six to seven, dinner; seven to eight, look over early history of the Jews in Venice; eight to eleven, Shakspeare Club; eleven to twelve, find play for reform school;—and oh, Harry,” concluded my sister, “do you know of any play suitable for boys—something bright and interesting, with no love-making?”

I did not.

“Helen,” said Aunt Charlotte mildly, “I notice you never leave any time between your hours. I mean, time to go from one place to another. I am afraid you walk very fast on the street. I was watching you the other day, and it seemed to me as if your head were a long distance in front of your feet. It is very inelegant for a woman to get a bad gait.”

I did not dare ask my question that day, neither did I Friday nor Saturday,—the last of the week being always very crowded,—and as for Sunday, there was morning and evening service, and Sunday-school, and the organ to play at the Old Ladies’ Home, and several sick people to visit. No city pastor with a number of outlying mission parishes could be more occupied. Aunt Charlotte suggested that if I were very anxious to ask Helen anything, I should join her Sunday-school class, that being composed of boys of all ages, whom Helen encouraged in conversation.

Three months brought no answer to my question. We lived in a perfect jumble of ideas: door-bell always ringing, parlor always full of strange people, all kinds of clubs meeting in the library, all kinds of things given in the house—bazaars, readings, concerts, charades, operettas, cooking-class, Sunday-school teachers’ meetings, art exhibitions, loan exhibitions, auctions of club-books, and comedies and tragedies in foreign tongues. The maids in the kitchen joined in this intellectual dissipation. Aunt Charlotte, teaching Elisabeth Stubbs a few geographical notions, was told three times in one evening that Cape Horn was the capital of Brazil. By way of explanation, Elisabeth added that her mind was on her Sunday-school lesson, that she had the whole book of Daniel to learn, and that next week she should have all of Corinthians and *Axes!* Jane did not aspire to books, but, having lost a distant relative, indulged in the elegance of a black crape bonnet, without which she would not even venture as far as the corner letter-box. Neither would she use her Christmas present, a nice brown silk umbrella. Being in mourning, how could she? To keep things pleasant, we gave her a black silk one.

Aunt Charlotte and I, in our narrow sphere, grew dizzy and tired and worried. One day at lunch came the beginning of a crisis; something queer about Helen’s head caught my attention. Either her bonnet was growing smaller, or her head bigger, or both. Aunt Charlotte also noticed it; she put on her glasses, and said, “Helen, some one has certainly cut off the front of your bonnet; it is the smallest thing I ever saw on a woman’s head.”

Helen replied that her bonnet was just the same as it always had been, and if we were coming to the Japanese tea, we had better come between five and six, as then the lanterns would be lighted, and that was the pleasantest time for meeting people.

By means of Japanese screens, umbrellas, rugs, divans, fans, and fancies, the first floor of an old-fashioned mansion was transformed into a Japanese tea-house. It was a place of fascinating color, brilliant with lanterns, and mysterious with hidden perfume. A Japanese page opened the door, Japanese maidens received the American money, and the bewildered guest passed from sunlight into lantern-light. More fair maidens in beautiful Japanese dress greeted him; Japanese tea was served in Japanese cups on Japanese trays, accompanied by sugar in Japanese bowls, and, to make the charm greater, the wearers of the rich foreign dresses moved and talked and smiled with irresistible American grace. Aunt Charlotte and I, very much impressed, came home to a more substantial tea by our New

England fireside. Helen was always careful to give us something particularly nice on those occasions when she could not give us her society. Of late she had been so much occupied that her little surprises had taken the form of canned goods. This evening we had canned apricots; a pot of white primroses stood on the table. Elisabeth Stubbs remarked, "Miss Helen said if I forgot everything else I was to remember the flowers, it being Mr. Harry's birthday." There was also a very shining brass lion in repoussé work on the mantel, with a card bearing "Many happy returns of the day."

"It's very effective, don't you think so, dear?" said my aunt, "only I do not approve of Helen's doing such things. It seems as if hammering must hurt the head. She hasn't the proper kind of hammer, I believe. It is certainly very noisy work, though she always hammers down cellar. Don't you think it rather hard work for a woman, Harry?"

I said it seemed to me about as hard as hammering a board fence together.

"I know you think Helen does too many things," said Aunt Charlotte, "but you need not speak in that tone, especially after she has been so thoughtful about your birthday. And she has so much on her mind, poor child! She has everything on her mind. I can't help worrying about her. How much do you think a woman can bear?"

I said, judging from Helen, I should suppose a woman's power of endurance was limitless.

Aunt Charlotte gave me a look of reproach. "Harry," she said, "don't you think that Sisters of Charity live a good life?"

This was an unexpected turn of conversation. I said I did not see the connection; that I thought they were foolish women.

"They are not considered so in the Roman Catholic Church," replied my aunt with dignity, "and I am sure your sister leads a far more self-sacrificing and higher life than even a Carmelite nun."

I said I hoped she did—which comment my aunt left unnoticed, and continued, musingly: "The nuns do everything by the hour—two hours' meditation, two hours' prayer, two hours' lying on a wooden bed, two hours' this, and two hours' that—and all for the salvation of their own souls; whereas your sister also does everything by the hour, but she works for the whole world."

"Excluding the family," I said, and I fear I said it in a very unpleasant way. The brass lion looked ready to tear off my head, and my aunt seemed so deeply distressed that I reconsidered and modified my judgment. Elisabeth Stubbs came in for the dishes, Aunt Charlotte took out her silk rug, and I opened my books.

"Do you belong to any men's clubs, where they write papers?" asked my aunt.

I said I did not belong to anything but the church choir.

"Then you don't know what men write about. I notice, in Helen's club, the ladies always write about things that happened several thousand years before Christ. It seems a long time ago."

The fire blazed merrily on the hearth, the brass lion took on a more friendly expression, our little family altercation had left us feeling perhaps more at peace with each other than an amiable dish of family sweetmeats. In my heart I thought there never was a sweeter, dearer girl than my sister Helen. The primroses smiled on the table. "I believe the German name for primrose means Key of Heaven," said my aunt, and she snipped an old black neck-ribbon into inch pieces.

It was at this peaceful moment that a sound came through the house—a sound that can mean so much, and so little,—life, death, a fortune, a valentine, or a beggar,—the ringing of the street bell.

"If you please, Mr. Harry," said Elisabeth, coming in very much out of breath, "it's Miss Helen come home, and something has happened to her."

On the hall sofa lay a figure in a blue crape dress embroidered with huge silver storks. From her hair hung silver bells and silver fans. The long flowing sleeves of crape swept the carpet. This was Helen. By her side stood a figure in crimson, woven with wonderful golden flowers; golden flowers and fans nodded in her hair. This was Mildred Smith. At a respectful distance stood the cabman, looking as mystified as if he had been driving in his black and earthly carriage two white-winged heavenly angels.

"I will go for the doctor, sir," he said in a subdued tone; and I gave him the address.

Aunt Charlotte came trembling behind me.

"You remember I told you her head looked large at lunch, Harry!"

"It is not her head, Aunt Charlotte," said Mildred, "it is the way her hair is arranged. You know we had to wear a good deal of hair for the dress. We were in the carriage coming home, and suddenly Helen said, 'I can't think! I don't know where I am!' and then she fell back and wouldn't speak, and when we got here she couldn't move."

"I am sure her head is larger than usual," said Aunt Charlotte; "it looks all distorted."

"It's the hair," said Mildred.

"I haven't any head," said Helen, opening her eyes; "I have a large block of wood on my shoulders—it is a square block——"

She closed her eyes, and I carried her up stairs.

THE world did not end. I think it limped a little for a time. In the back hall stood a half-packed barrel of clothing intended for the Navajo Indians. I finished packing it, putting in a few extra things that fell in my way, and started it for Mexico. I engaged a colored boy by the day to carry notes. I filled out one hundred "Bohemian" postals, thereby notifying the club concerning the next place of meeting. I met the managers of the St. Margaret Orphan Asylum, of the Old Ladies' Home, and of several minor associations, and made over to them small accumulations of money found in as many envelopes labeled and locked in Helen's desk. I sent a message to Elisabeth Stubbs's Sunday-school teacher, begging her to excuse our maid from preparing elaborate lessons, as we needed all her mind at home. In the meantime Aunt Charlotte fell ill from anxiety, and in search of a nurse I went from Morning street to Vesper street. At the last house on Vesper street I found a Mrs. Newman, an accommodating woman, who did not object to sitting behind a screen when Aunt Charlotte was not feeling strong enough to see her in the room. As for Helen, she remained during several days in a stupor, thereby giving us an opportunity to arrange her affairs; then she opened her eyes and said she wished to have a sentence fixed on her forehead, this being, she explained, the custom of the dwellers on the Euphrates before the fall of Babylon. She wished Mildred Smith to print it with charcoal on brown wrapping-paper.

Mildred Smith began to cry when I asked her to do this, and said she couldn't print, her hand trembled so, and that she didn't know what sort of a sentence I wanted, and that perhaps Helen was going to die.

Aunt Charlotte thought we might find something in Helen's note-books. Mrs. Newman, behind the screen, suggested timidly a verse of Scripture. "Print something," I said, going back to Mildred; "it doesn't much matter what." Mildred printed in trembling letters the word "Helen," and we fastened it upon her forehead.

"Helen"—many a time we looked at that name, wondering if the Helen we knew would ever come back out of the multitudinous forms and fancies which seemed to replace her. Throughout all those strange weeks my sister would not allow the removal of this bit of brown paper. It was as if she wished to preserve some clew to her own identity. As Aunt Charlotte said, "Poor Helen was always taking notes, and now she had taken a note on herself." Aside from the one continual feeling that her head was a square block of wood, my sister seemed to suffer no pain, and her tem-

perature and pulse were unaffected. She talked incessantly—not wildly—but in a quite low tone, as if she were reciting.

Sometimes she described herself as a Chinese pagoda, with bells on every story; sometimes she was a large paper bag, containing ounce-packages and pound-packages; then she would suddenly become a bass-viol or a Polish exile; and I remember at this stage she told me that she wished to play Chopin well, and therefore she must be filled with the sufferings of his country!

Helen had taken a tremendous overdose of mental food, which the brain, in self-defense, was gradually throwing off. As long as she continued to talk, we had only to wait patiently; but there would come a moment when this great supply of thought would be so diminished as to leave a great emptiness, and this emptiness must be at once tenderly treated and judiciously fed, or the difference between extreme high pressure and want of pressure would be fatal.

The delicate question was, of what should this mental gruel consist. It must be simple, soothing, and not likely to excite any train of deep thought.

One day there came a sudden silence in the room. Helen had ceased talking. Her eyes were fastened upon me with a hungry, eager look. I sat down by the bed, and said quietly and gently, in a matter-of-course way, and feeling very sure of myself:

"Sing a Song of Sixpence, a pocket full of rye,
Four-and-twenty blackbirds baked in a pie—
When the pie was opened the birds began to sing."

It was an unfortunate selection. Helen, to my amazement, instead of being gradually lulled to sleep, interrupted me in a startled way, with a touching weakness in her voice, as if its strength were spent.

"The pie represents the earth; the top of the pie is the sky; when the pie was opened, means the break of day, and then the birds begin to sing; the king is the sun—" And thus she rambled on from Mother Goose rhymes, by way of German fairyland and Norse legends, to the mysteries of ancient mythology.

The doctors came and went. Mildred, Aunt Charlotte, and I sat helpless in Helen's bright little sitting-room. Mrs. Newman waited behind the screen. That strange atmosphere which creeps over a house in supreme moments crept into ours. The light that fell shyly in through the half-closed blinds did not seem like light; the children's voices coming up from the street were not like children's voices; we were in a far-away, shut-off place of suspense and dread. We seemed unknown to ourselves. Mildred sat pale and motionless.

I looked at her, and wondered would she also have this strange affliction? Would all of Helen's set have it? Must they also pay this terrible price for their love of humanity and human advancement?

Was it love, pure and simple? Was it not a folly, a fashion? A verse ran through my mind, "Whatsoever thy hand findeth to do, do it with thy might." What did that mean? Had it any connection with the philanthropic women of the day? Helen had worked with all her might. She had lived two days in one. I do not think she did it from ambition or from fashion; she did it from a sort of necessity. She was in the whirl of the time and the customs of the time. It would have been useless to stop her, for she could not stop.

I went back in my thoughts to the days when good Queen Bertha spun among her maids. Was that a wiser and better time when women spun, when women gathered at the village fountain, morning and evening? Were they happier than the women who gather to-day around centers of art and of science? Physically they were stronger. Was not that time of quiet, simple life a time of physical development, as to-day is a time of mental development? Might there not be a period coming later in history when both developments would be united and perfected? or was something wrong? was it all wrong, or was nothing wrong?

From Helen's room came disconnectedly the words — pre-Adamite — realism — high art — symbolisms — unities. Then the dreaded silence. We looked at each other. "Quick, Mildred," I said nervously, "give me something to say — something to repeat over and over."

"I cannot think of anything," said Mildred, helplessly. Aunt Charlotte was even more helpless. Mrs. Newman came out from her screen, and with an evident professional feeling that she must come to our aid, whispered, "There's that lovely hymn, 'Sister, thou wert mild and lovely.'"

"Something monotonous — something like counting," I said to Mildred, appealingly; and Mildred, opening a cookery-book, pointed out "one-two-three-four cake."

"Helen used to make it," she said with a sob; "I don't believe it will excite her." We took turns for two days in repeating at Helen's bedside, "One cup of butter, two cups of sugar, three cups of flour, four eggs."

There was sense enough in the words to connect them, they touched on no dangerous topic, their monotony was perfect, and under their ceaseless repetition Helen fell asleep, quietly asleep, like a child.

I walked wearily out to the sitting-room, and, taking Mildred's hand, began to pass my own slowly over it as I had been doing for Helen, and I began, "One cup of butter, two cups of sugar, three cups of flour, four eggs." Mildred, gently withdrawing her hand, said:

"How tired you are!"

They darkened the room, made me lie down, and left me. I dropped asleep, still repeating, "One cup of butter, two cups of sugar, three cups of flour, four eggs."

THE world gained rather than lost by my sister's illness. She awoke from the sleep into which we at last lulled her with fresh energies and a mind ready to plan new methods for benefiting mankind, and while waiting strength to execute these plans her fingers fashioned an elaborate silk quilt, which brought a fabulous price at a charity-fair.

Aunt Charlotte and I looked on in awe and wonder and admiration.

"There is one comfort," said my aunt; "she isn't the kind to have things twice, so she will not have *that* sickness again. She never had the mumps or the measles but once; you know some children have them several times. I've been thinking, Harry dear, perhaps the Lord meant for women like her *never* to stop; perhaps they are needed just now to hold up the world. They seem to me like the early martyrs; only, instead of being burned at the stake, they are being consumed in life's fire; but they are too exalted to notice what is happening to them,"—Aunt Charlotte's eyes shone,— "there's something grand about it, Harry dear!"

As I had not considered Helen or any of her friends in the light of the early martyrs, I looked at Aunt Charlotte anxiously and said I feared her imagination was growing exalted. "Well, I don't know," said my aunt, "I can't help thinking about the other world. I suppose it is wicked; but there's been so much said lately about 'going right on' studying languages and giving concerts and sketching and helping people, just the same as here. It wouldn't be my heaven, but it might be Helen's — only I do want her to have a quiet place to rest in first!" Then, as if shocked by this familiar handling of a sacred subject, my aunt hastily opened a hymn-book, and said she knew it wasn't right to say such things; and I, watching her, wondered vaguely if Helen would ever find time to answer the question I tried to ask so long ago — for the question still waits its answer.

Harriet Lewis Bradley.

THE FRAMERS AND THE FRAMING OF THE CONSTITUTION.

ON the 11th of June, 1776, the Continental Congress, then sitting at Philadelphia, chose two committees to perform two pieces of important work. One was to draw a declaration of independence; the other was to frame articles of perpetual union. The Committee on the Declaration finished their work and gave it to the world on July 4th, 1776; the Committee on Articles of Confederation reported a plan four days later; but it was not till March 1st, 1781, that the articles were finally adopted.

The government that went into effect on that day was bad from beginning to end. There was no executive, no judiciary, and only the likeness of a legislature. Congress consisted of one house presided over by a president chosen each year by the delegates from among their number. The delegates could not be more than seven nor less than two from any State, were elected yearly, and could serve but three years in any term of six. On the floor of Congress all voting was done by States, and the assent of nine was necessary to declare war, to make peace, to coin money, to pass any ordinance of the least importance. To such trivial questions as came up from day to day,—when should the house rise; who should be geographer for the next year?—the assent of the majority of the States was enough, and it was a white day whereon six did not make a majority.

To this body the States had given a few powers, and had given them grudgingly as of necessity. Congress had power to declare war, make peace, issue bills of credit, keep up a navy and army, contract debts, enter into treaties of commerce and alliance, and settle disputes between the members of the confederation. But it could not enforce a treaty nor a law when made, nor impose any restriction on commerce, nor lay a tax of any kind for the purpose of raising a revenue. Bad as the articles were, they were made worse yet by the provision that to amend them required the consent of each one of the thirteen members of the Union.

The evils of this system were not slow to appear. Acting on States, and not on individuals, Congress never secured a hold on the people, was always looked on as a revolutionary body, and was treated, first with indifference, and then with contempt.

The large vote needed to pass a weighty measure often made it impossible to legislate at all. Two States, Georgia and Rhode Island, were seldom represented. Of the eleven others more than eight were rarely present, and Congress was thus forced to adjourn again and again for want of a quorum. Repeatedly these adjournments covered a space of thirteen consecutive days. As nine of the eleven States had but two delegates each, the powers of Congress passed into the hands of three men, who, by their negative votes, could defeat any measure requiring the assent of nine.

Lacking power to enforce its acts, Congress made treaties which the States set at naught, called for money which the States never paid, and saw article after article of the confederation broken in the most defiant way. The States were forbidden to wage war and make treaties. Yet Georgia waged war and made a treaty with the Creeks. The States were forbidden to keep troops in time of peace. Yet Pennsylvania sent troops that drove the Connecticut settlers from the valley of Wyoming; Massachusetts raised an army and put down Shay's rebellion. The States were forbidden to enter into compacts. Yet Maryland and Virginia made a compact; Pennsylvania and New Jersey set bounds to Delaware. Indeed, Congress itself was more than once driven to exercise powers to which, by the articles, it had no right whatever.

Having no power to manage trade, Congress could not, by commercial restrictions, force Great Britain to enter into a trade treaty. British goods came over in immense quantities, the balance of trade turned against us, and, to settle the balance, the coin of the country went over to England in boxes and barrels. The States, deprived of a circulating medium, put out paper money; with paper money came tender laws and force acts, and in Massachusetts open rebellion against the commonwealth.

Many of these evils had long been felt. Indeed, the Articles of Confederation were not in force before it was proposed to amend them. The Hartford Convention of 1780 urged the States to suffer Congress to tax them according to population and spend the revenue so raised in paying the interest on the public debt. Congress accordingly asked for such an amendment, and twelve States consented. But Rhode Island would not, and it failed. Again a little while and Congress asked for specific duties and a permanent revenue, and again

twelve States consented. But this time New York stood out, and the second proposed amendment was a failure. At last, made desperate, Congress asked for power to regulate trade for twenty-five years. Once more twelve States consented. Once more New York refused. Once more the attempt to amend the articles was a failure. Then, every other means having been tried, Congress approved the call already sent out for a convention of the States at Philadelphia.

Such a convention had twice been asked for. New York wanted one in 1782; Massachusetts was equally eager in 1785. But the origin of the Constitutional Convention of 1787 goes back to the action of a joint commission which sat at Mount Vernon in March, 1785. There were then no concerted regulations between Maryland and Virginia touching the jurisdiction and navigation of the Chesapeake Bay and the Potomac River. Trouble had arisen in consequence, and the commission had been chosen to frame a compact that would serve as a remedy. But they had not been very long at work when they saw that common duties and common principles for explaining the meaning of commercial laws and settling disputes about the currency were just as necessary as well-defined rights on the river and bay. With these things, however, the commissioners had no right to meddle. Yet they ventured to draw up a supplementary report setting forth the need of legislation on the currency, the duties, and commerce in general, and urging the appointment each year of two commissioners to arrange such matters for the next year.

Maryland readily accepted the report, and asked Delaware and Pennsylvania to come into the scheme. But Virginia went further, and asked all the States to a trade convention at Annapolis in September, 1786. New York and New Jersey, Pennsylvania, Delaware, and Virginia alone attended, spent two days in discussing the low state of trade and commerce, in lamenting their want of powers, and then called a new convention, to meet at Philadelphia in May, 1787. This was the call that Congress approved in February, 1787; and it was high time, for seven States had already chosen delegates.

Virginia was first to act, and sent up her seven most noted citizens. Jefferson was then minister to France; Patrick Henry and Richard Henry Lee would not serve; but in their places came George Washington and James Madison. Edmund Randolph, the governor, George Mason, George Wythe, John Blair, and James McClurg, a professor in William and Mary College.

New Jersey came next, and on November 23d

chose William Livingston, eleven times her governor; William Paterson, ten times her attorney-general; David Brearley, her chief-justice, and William Houston, her delegate to Congress. Houston fell sick, and Jonathan Dayton took his place. Scarce a month went by but the name of some State was added to the list. In December came Pennsylvania; in January came North Carolina; in February came Delaware, Massachusetts, and New York. South Carolina and Georgia came in April, and Connecticut in May. New Hampshire would gladly have acted promptly, but her treasury was empty, her delegates could not bear the cost of the journey themselves, and the convention was half through its work when John Langdon and Nicholas Gilman appeared in her behalf. Rhode Island alone refused to attend.

The day chosen for the meeting of the convention was the second Monday in May, which, in that year, fell on the 14th of the month. But so tardy were the delegates in setting out, and so great were the hindrances met on the way, that the 25th of May came before seven States were present in the State-house. This made a quorum. The convention at once called Washington to the chair, chose William Jackson secretary, appointed a committee to prepare rules, and adjourned, to meet again on the 28th. Nine States then answered to their names. The doors were then closed, a solemn pledge of secrecy was laid on the members, and thenceforth for many years what took place in the convention was never fully known.

The delegates thus bound to secrecy were assuredly a most remarkable body of men. Hardly one among them but had sat in some famous assembly, had signed some famous document, had filled some high place, or had made himself conspicuous for learning, for scholarship, or for signal services rendered in the cause of liberty. One had framed the Albany plan of union; some had been members of the Stamp Act Congress of 1765; some had signed the Declaration of Rights in 1774; the names of others appear at the foot of the Declaration of Independence, and at the foot of the Articles of Confederation; two had been presidents of Congress; seven had been, or were then, governors of States; twenty-eight had been members of Congress; one had commanded the armies of the United States; another had been Superintendent of Finance; a third had repeatedly been sent on important missions to England and had long been minister to France.

Nor were the future careers of many of them to be less interesting than their past. Washington and Madison became Presidents of the

United States; Elbridge Gerry became Vice-President; Charles Cotesworth Pinckney and Rufus King became candidates for the presidency, and Jared Ingersoll, Rufus King, and John Langdon candidates for the vice-presidency; Hamilton became Secretary of the Treasury; Madison, Secretary of State; Randolph, Attorney-General and Secretary of State, and James McHenry, a Secretary of War; Ellsworth and Rutledge became Chief-Justices; Wilson and John Blair rose to the supreme bench; Gouverneur Morris, and Ellsworth, and Charles C. Pinckney, and Gerry, and William Davie became ministers abroad. Others less fortunate closed their careers in misery or in shame. Hamilton went down before the pistol of Aaron Burr; Robert Morris, after languishing in a debtor's prison, died in poverty; James Wilson died a broken-hearted fugitive from justice; Edmund Randolph left the cabinet of Washington in disgrace; William Blount was driven from the Senate of the United States.

Blount sat for North Carolina, and with him were Alexander Martin, a soldier of the Revolution, Richard Dobbs Spaight, a native of Ireland, Hugh Williamson, and William Davie. South Carolina sent Pierce Butler, John Rutledge, and the two cousins, Charles and Charles Cotesworth Pinckney. Butler was an Irishman, was descended from the Dukes of Ormond, and, when the Revolution opened, was a major in the 29th Regiment of Foot. The 29th was one of the regiments stationed at Boston and furnished the soldiers who did the shooting in the famous Boston massacre. Disgusted at the treatment of the colonists, and convinced that justice was on their side, he threw up his commission when the war opened, joined the continental army, fought through the war, and then settled in South Carolina. Another man of Scotch-Irish ancestry was John Rutledge. He too had been educated abroad, had studied law at the Temple, and had been sent at the age of twenty-six to the Stamp Act Congress of 1765. Nine years later he sat in the first Continental Congress, and was pronounced by Patrick Henry the most eloquent speaker in that body. Fearless, resolute, a man of fine parts, he was unquestionably the foremost man South Carolina produced till she produced Calhoun.

Georgia sent up William Houston, William Pierce, a Virginian, William Few, and Abraham Baldwin, a Connecticut man. The Connecticut delegation was, as a whole, the ablest on the floor. Save Benjamin Franklin, no man who came to the convention had made for himself so instructive and so useful a career as Roger Sherman. He was a man of the people. Born near Boston, he got his education

at the common school, and was early apprenticed to a shoemaker. His apprenticeship over, he set out on foot, with his tools on his back, for New Milford in Connecticut. There he kept store and read law till he was admitted to the bar, when he moved to New Haven. At New Haven he rose rapidly in the estimation of his townsmen, was made treasurer of Yale College, represented the town in the legislature, and when New Haven became a city, was chosen first mayor, and remained mayor for the rest of his life. He was fourteen times sent to the legislature. He was twenty-three years a judge. Connecticut elected him to the Congress of 1774, and reelected him repeatedly till he died. He signed the Declaration of Rights in 1774; the Declaration of Independence, which he was one of the committee to write; and the Articles of Confederation, which he helped to frame.

With him came William Samuel Johnson and Oliver Ellsworth. Johnson had been a judge and a member of Congress; but he enjoyed a distinction rarer still, for he was a scholar of high rank. Indeed, the fame of his learning reached England, where Oxford made him a Doctor of Laws, and the Royal Society a member.

Massachusetts sent up Caleb Strong, Nathaniel Gorham, a rich Boston merchant, Elbridge Gerry, a signer and a member of Congress, and Rufus King, a congressman and a fierce hater of slavery. Alexander Hamilton, John Lansing, and Robert Yates represented New York. Yates and Lansing were men of ability; but they held the narrow and selfish views then so prevalent in New York State, became mere obstructionists in the convention, and when they could not succeed in setting up State-rights government, left the convention and went home. The departure of Yates is much to be lamented, for, while he staid, he was busy taking notes of the debates and proceedings. Five men came from Delaware,—Gunning Bedford, Jr., Richard Bassett, Jacob Broome, George Read, who signed the Declaration, and John Dickinson, who would not. The largest delegation was that from Pennsylvania. On her list are the names of Jared Ingersoll, who led the bar, and whose father had been driven from New England for trying to serve as Stamp agent in 1765, George Clymer, another signer, Thomas Fitz Simons, a great merchant, Robert and Gouverneur Morris, Thomas Mifflin, a general of the Revolution, a member of Congress, and once a member of the infamous Conway Cabal, James Wilson, a Scotchman and the best-read lawyer in the convention, and Benjamin Franklin. Maryland sent up Daniel of St. Thomas Jenifer, Daniel Carroll of Carrollton, John Mercer, Luther Martin, and James McHenry.

It is a sure sign of the high respect in which this famous body of men was held, that not one word was uttered by the people against their secret sessions. Profound secrecy, it was said, could not be kept by men who quarreled. Secrecy was kept, and this meant that the delegates were of one mind on all Federal measures. Had the world, it was asked, ever beheld such a sight? When before had a people without strife and without bloodshed deputed a band of patriots, that would have adorned the best days of Greece and Rome, to cure the evils of its government? That evils existed was lamentable; but they were unavoidable. The Confederacy was like a hut or a tent put up in time of war and fit for the needs of war. But peace was come, and it was now time to build a suitable and durable dwelling, with tight roof, substantial bolts, and strong bars, to shield the States from every kind of harm.

The simile of a house and a roof was a favorite, and was used again and again. The United States was like an old man and his wife who with thirteen sons landed in America. There they built a spacious dwelling and lived happily for several years. But the sons grew weary of the company of their parents, and each put up a cabin for himself near their old home. At once trouble began. One had implements of husbandry stolen; another lost a crop; a third had his sheep eaten by the wolves; a fourth nearly died of cold from the roof of his cabin being blown away; a fifth saw his flock swept off by floods. At last twelve of the brothers met on a plain and resolved to ask their father to take them back. He did so gladly, and the old house, mended and enlarged, was made more beautiful than ever. The thirteenth son stood out, and, after three years, hanged himself by his garters in the woods.

This son was Rhode Island. His flocks, in the language of the simile, were indeed being eaten by wolves. Wholly given over to the party of Shays, the party of legal-tender acts, of force acts, of paper money, the State had sent no delegates to Philadelphia and was not at any time represented in the convention. This contempt for the wishes of the country was warmly resented. She was denounced as the cause of the failure of the impost. To her charge was laid the suffering of the soldiers in the Revolutionary War, the heavy taxes, the bankrupt treasury, the poverty of the whole nation. Let her, it was said, never again be suffered to defeat a Federal measure. Drop her from the Union. Turn her out from the company of States. Or, better still, apportion her to Massachusetts and Connecticut. Vermont would more than take her place. As the 4th of July drew near, the governor of New Jersey was said to have expressly ordered that no

more than twelve cannon be fired, and no more than twelve toasts drunk. At Trenton and a few places elsewhere this was done. The convention, it was asserted, was determined that Rhode Island should be considered out of the Union. The government about to be set up would hold her responsible for a fair share of the Federal debt, and would first seek by gentle means to collect it. But, if these failed, the sum would be taken from her by force.

As to what this new and vigorous government would be, the people made all manner of guesses. Many plans, it was thought, had been talked of. One was said to keep the form but not the spirit of democracy; another parted the States into three republics; another gave a strong executive power without even the semblance of a popular constitution. The convention was accused by some of having a plan to set up a king. A constitution, the knowing ones asserted, had been made, titles, orders, and social distinctions established, and a commission would soon be sent to offer the crown to the Bishop of Osnaburgh, the second son of King George. This idle tale was more than half believed, and each post brought letters to the delegates begging to know if it were true. The answer invariably was, "While we cannot affirmatively tell you what we are doing, we can negatively tell you what we are not doing; we never once thought of a king."

For our knowledge of what they did think of doing we are indebted to the journals of the convention, to the notes taken down by Yates and Madison, and to the "Genuine Information" of Luther Martin. From these sources it appears that the serious work of the convention was opened by Randolph on the morning of Tuesday, the 29th of May. In a speech of great force he summed up the weak points of the Articles of Confederation, showed how unsuited they were to the needs of the country, and urged all present to join in setting up a strong national government. As a plan of such a government, he read fifteen resolutions which the Virginia delegate had framed while waiting for the convention to assemble.

This, which came in time to be known as the Virginia plan, provided that there should be a national executive, a national legislature, a national judiciary and council of revision; that the executive should be chosen by the legislature and be ineligible a second time; that the legislature should consist of two branches, with power to coerce refractory States and veto all State laws contrary to the Articles of Union; that the people should choose the members of the first branch; that the first branch should choose the members of the second from men nominated by the legisla-

tures of the States; that the representation of each State should be proportioned to the inhabitants on its soil or to the share it bore of the national expenses; that the judiciary should be elected by the national legislature; that the executive and the judges should form a council to revise all laws before they went into force; that provisions should be made for admitting new States, for amending the Articles of Union, for assuring to each State a republican form of government and a right to its soil.

The resolutions read and explained, Randolph moved a committee of the whole on the state of the Union, and to the committee the Virginia plan was sent. No sooner was this done than Charles Pinckney of South Carolina presented a second plan for a constitutional government. This too went to the committee, was never heard of again, and is now hopelessly lost.

Next day the Virginia plan came formally before the committee, and during two weeks was carefully debated. Each resolution was taken up. Some were amended, some were dropped, and others put in their stead. But the feeling of the delegates seemed to be that there should be an executive, legislative, and judicial branch of government; that the legislature should consist of two houses; and that the members of one should be elected by the people. When the number of the executive and the way of choosing came up, there were almost as many opinions as States on the floor. Some wanted an executive of three, one from each part of the country; some were for a single executive with a council of revision; some for a single executive without a council of revision. He was to be elected directly by the people. He was to be chosen by electors, or by State legislatures; by the State governors; by one branch of the national legislature; by both branches on a joint ballot; by both branches on a concurrent vote; he was to be chosen by lot. For three days no other business was done. It was then determined that the executive should be chosen as the national legislature decided, should hold office seven years, and should not be reëlected.

This decision was reached on Monday, the 4th of June. The debates up to this time had been most amicable. But, before the week ended, the delegates began to wrangle, sectional spirit began to appear, and those lines which again and again divided the convention before it rose became plainly visible. There were parties made up of individuals and parties made up of States. There were men who wished for a Federal government not much unlike that they were trying to better, and there were men who did not want a confederacy at all. There were men eager to see a

centralized government set up, and men insisting that State sovereignty should be carefully maintained. There were the Southern States against the Northern States, the commercial States against the agricultural States; and what proved far more serious still, there were the great States against the small.

Out of these party divisions came in time the three compromises of the Constitution. The fear in which the little States stood of the great secured the compromise giving representation to States. The hatred felt by the slave States for the free caused the second compromise, giving representation to slaves. The jealousy between States agricultural and States commercial brought about the third compromise, on the slave-trade and commerce.

The great States were Massachusetts, Pennsylvania, and Virginia; New York, New Jersey, and Delaware were the small. The great States were for a strong national government on the Virginia plan; the little States were for the old confederation mended and improved, and made their first firm stand on Saturday, the 9th of June. The second resolution of the Virginia plan, that suffrage in the national legislature ought to be in proportion to wealth or free inhabitants, had been postponed, and this, on motion of Paterson, of New Jersey, was now taken up.

The convention, he said, had no power to make a national government. Congress had assembled them to amend the Articles of Confederation. The articles were, therefore, the proper basis for all proceeding. Bad as they might be in some ways, they were excellent in others. They acknowledged the sovereignty of the States, treated them all alike, and gave to each the same vote and the same weight when assembled in Congress. On no other plan could a confederacy of States be maintained. Representation as proposed, representation in proportion to wealth or numbers, looked fair in the face; but it was unfair and unjust at heart. Suppose it adopted, suppose the States to send delegates to the first branch according to the sums of money they paid to the Board of Treasury, and see what would happen. Virginia would have sixteen votes and Georgia one. Was this just? Was it safe? Did any one think New Jersey would risk her independence, her sovereignty, her well-being in a Congress in which she had but five votes while Virginia had sixteen? There was no more reason for giving a State paying a large quota more votes than a State paying a small quota, than there was for giving a rich man more votes at the polls than a poor man. New Jersey would never confederate on such a plan. She would be swallowed up. She would rather submit to a despot than to such a fate.

The great States took a different view. It was true, they admitted, that each State was sovereign, and that all were therefore equal. It was also true that each man is naturally a sovereign over himself, and that therefore all men are naturally equal. But could he keep this sovereignty when he became a member of a civil government? He could not. Neither could a State keep her sovereignty when she became a member of a Federal government. All government came from the people. Equal numbers of people ought therefore to have an equal number of representatives, and different numbers of people a different number of representatives. The people, not the States, were to be represented. And did any one think that 150 Pennsylvanians should have no more representation than 50 Jerseymen? Six States thought not, and voted that in the first branch representation should be according to some equitable ratio. An equitable ratio was next decided to be the rule by which, in April, 1783, Congress fixed the quotas of the States. This rule was that quotas should be laid according to the whole number of free white inhabitants of both sexes, of every age, occupation, and condition, and three-fifths of all other persons save Indians not taxed.

The small States had lost the day. But they were not discouraged, and, led on by Connecticut, made a stout fight for an equal vote in the Senate. Again they were defeated, again population was made the basis of representation, and, this done, the committee hurried on to the consideration of the remaining resolutions of the Virginia plan. By the 13th of June they had all been passed; the committee had reported them to the House, and the House was about to name a day for considering the report, when Paterson rose and asked leave to bring in a totally different plan. Alarmed at the strong display of national feeling, the delegates from Connecticut and New Jersey, Delaware and New York, with Luther Martin of Maryland, had framed a plan and chosen Paterson to lay it before the convention; a plan which Hamilton well described as "pork still, with a little change of the sauce." Congress was to consist of a single House, with power to regulate trade and commerce, and raise a revenue by duties on imports, postage on letter and newspaper, and stamps on paper and vellum. There was to be an executive of several persons not eligible to a second term and removable by Congress at the request of a majority of the governors of the States. There was to be a supreme court, uniform laws of naturalization, and, when necessary, requisitions on the States for money, according to the rule of April, 1783; officers were to be sworn to support the constitution, and the constitution

and its laws and treaties were to be "the supreme law of the land."

This plan, it was said, had two great merits,—it fully agreed with the powers of the convention; it would be gladly accepted by the people. These were important; for the duty of the convention was not to frame such a government as might be best in theory, but such as the people expected and would approve. If the Confederation was really so bad, let the convention say so, go home, and get power to make such a government as they wished. But to assume such power was not to be justified on any ground. If, as some held, the Confederation had fallen to pieces, if no general government really existed, then the States were once more independent sovereignties, and should stand on the footing of equal sovereignties. All then must agree or none could be bound. If the Confederation did exist, then by the terms of the articles no change could be made without the consent of all. This was the nature of all treaties. What had been unanimously done must be unanimously undone. It was said that the great States consented to this equality, not because it was just, but because, at the time, it was expedient. Be it so. Could they, therefore, take back that assent? Could a donor resume his gift without the leave of the donee?

It was now the turn of the great States to make an attack, and they did so vigorously. Wilson drew a long comparison between the Virginia plan and the Jersey plan. By the Virginia plan there were to be three branches of government; by the Jersey plan but one. By the Virginia plan the people were to be represented; by the Jersey plan the States. By the one a majority of the people would rule; by the other a minority. The Virginia plan provided for a single executive; the Jersey plan for an executive of many. The Virginia plan provided for a negative on the laws of the States; the Jersey plan for the coercion of the States.

Madison demanded to know in what respect the Jersey plan was better than the old articles. It could not prevent violations of the laws of nations, nor of treaties, nor prevent encroachments on the Federal authority, nor trespasses of the States on each other, nor secure internal tranquillity, nor give good governments to the States, nor guard the Union from the influence of foreign powers. It could cure none of the evils that had long grown intolerable.

Hamilton, who liked neither of the plans, now read to the committee his own thoughts on the best form of republican government. The supreme legislature, as he called it, was to consist of two branches,—the Assembly and the Senate. Members of the Assembly were to be chosen by the people for three years.

Members of the Senate were to be elected by electors chosen by the people and serve as long as they behaved well. The executive was to be one man chosen by electors for good behavior. He was to have a veto on all laws about to be passed, was to conduct war when once begun, make treaties with the leave of the Senate, and appoint the heads of the departments of war, finance, and foreign affairs without consulting any one. There was to be a supreme judiciary, and in each State there were to be courts to try all matters of general concern. State laws contrary to the laws and Constitution of the United States were to be void. To prevent, if possible, such being passed, the general government was to appoint the governors of the States.

The committee had now before them the Virginia plan, the South Carolina plan, the New Jersey plan, and the thoughts of Hamilton on government, which he distinctly declared were thoughts, and nothing more. But they gave no heed to any schemes save those sent in by Virginia and New Jersey. The question, therefore, at once became which of the two should be reported. We must, said the State-rights party, report the Jersey plan. Our powers are limited, and this is the only plan that comes within them. Our powers, said the Virginia party, extend to everything or to nothing. We are free to support any plan and to reject any plan. The people are bowed down under intolerable burdens. They look up to this convention with fond hopes, and expect from it a government that will cure the ills of which they complain. A strong national government alone can do so, and such a government the Virginia plan will give them. The committee heartily agreed to this, voted the Jersey plan inadmissible, rose, and reported the Virginia plan to the convention.

This much settled, the debating went smoothly on for a week. Put in good humor by the adoption of their plan, the great States now began to make some idle concessions to the small. The word "national" occurred twenty-six times in the resolutions, was hateful to the little States, and was therefore graciously dropped. But the questions that took up the time of the convention till the last of June were: Should the legislature consist of one branch or two? Should there be one executive or three? Should the members of the first branch be twenty-five years old or thirty? Should the members of the second branch serve for nine years, for seven years, for five years, during good behavior? Then was reached that question which never once came up for discussion without provoking a violent display of sectional feeling and a long and rancorous debate. The question was,

Should suffrage in the legislature be according to the rule established by the Articles of Confederation, or according to some other?

Defenders of the State-rights theory asserted that the general government ought to act on States, and not on individuals. The States were sovereign. Being sovereign, they were equal, and being equal, they ought to have equal votes. If the large States did indeed have the same interests as the small, there could be no harm in giving equal suffrage to all. If the great States did not have the same interests as the small, then unequal suffrage would be dangerous to the last degree. Once given votes in proportion to population or to wealth, it would be all the same whether the delegates were chosen by the people or by the legislatures. The great States would combine; the little States would be enslaved.

The defenders of the Virginia plan pronounced these fears and reasons absurd. It was the great States that fell out and the small ones that combined. This had always been the case in the Old World, and it would be so in the New. Massachusetts and Pennsylvania and Virginia could never combine. They were far apart. Their manners, customs, religions, were unlike. They had nothing common even in trade. They were, however, rich, populous, and would surely be called on to bear the largest part of the cost and burdens of the government about to be set up. If, therefore, they consented to equality of suffrage, they would be outvoted, and their money and their property would be completely at the mercy of the little States.

Between these two contending parties now appeared for the first time a party of compromisers, made up chiefly of Connecticut men. Both the State-rights and the Virginia party went, they held, too far. One looked on the States as so many separate political societies; the other looked on the people as one great political society of which the States were merely districts of people. The truth was the States did exist as political beings, and a government to be good and lasting must be formed for them in their political capacity as well as for the individuals composing them. The well-being of each was to be considered. The true plan was, therefore, to give the people representation in the one branch and the States representation in the other. New York, New Jersey, and Delaware were in no mood for a compromise and would hear nothing of such a plan. But the great States had their way, and voted that in the first branch representation ought to bear some proportion to the population of the States. This was final. Thenceforth no attempt was ever made to set it aside.

Greatly elated, the compromisers now redoubled their efforts, and insisted that, in the

second branch, the voting should be by States. But the defenders of the Virginia plan again flew into a passion, another rancorous debate took up two days, and when the vote was finally reached, the ballot stood five to five. Never before had the members been so angry, nor the speeches so personal and bitter. Reflections, recrimination, taunts, threats of secession, were heard on every side. In this pass, at the suggestion of Cotesworth Pinckney, the whole matter of representation was sent to a grand committee, and the convention adjourned for three days.

But the debates in the committee of eleven were as stormy as the debates in the committee of the whole. Again a compromise was offered and again it was refused. You propose, said the State-rights party to the Virginia party, to consent to an equal representation in the second branch of the legislature, if we will consent to an unequal representation in the first. We will not. This is merely offering, after a bitter struggle to put both your feet on our necks, to take one off if we will quietly suffer the other foot to remain. But we know well that you cannot keep even one foot on unless we are willing, and we know well that, having one firmly planted, you will be able to put on the second when you please. Riches will come to you; population will come to you, and with them power. Will you not then force from us that equality of representation in the second branch which you now deny to be our right, and yield only from necessity? You tell us that you will enter into a solemn compact with us not to do so. But did you not years ago enter into a solemn compact with us, and are you not now treating it with the utmost contempt? Do you think that while we see you wantonly violate one, we will meekly enter into another?

Franklin most happily was a member of the committee, and brought his colleagues in time to a better mind and persuaded them to agree to a report. This recommended that each State should be given one representative in the first branch of the legislature for every forty thousand inhabitants, and that in the second branch each State should have an equal vote. As the price of the concession by the great States, it was insisted that all money bills should originate in the first branch and not be amended in the second, and that no money should be drawn from the treasury except by bills originating in the first branch.

Thus was the first compromise ended. The report, indeed, did not pass the convention for two weeks, and then by a close vote. But it was not again disputed that in the second branch the States should have an equal vote.

Meanwhile, the committee of the whole took up the report in detail. The clause fixing

representation at one to forty thousand was recommitted, and reported back with the provision that in the first House of Representatives there should be fifty-six members, and that for the future representation should be based on wealth and population. The provision of one representative for forty thousand inhabitants was dropped as too unsafe. It would enable the West in time to outvote the East. By making a general and not a specific rule, the East would keep the government in its own hands, take care of its own interests, and deal out representation in safe proportion to the West.

But wealth and population were ever changing, and to find this change Randolph proposed an estimate and a census. The idea seemed a good one. There were, however, below the Mason and Dixon line thousands of human beings who might with equal justice be considered as population or as wealth. They could be bought and sold, leased and mortgaged, given away, or bequeathed by will. They held no property, acquired no estates, and to the delegates from the North and East seemed to be of no more account in the South than a black horse or a black ox in New England. They insisted, therefore, that slaves should be looked on as property. By the delegates from the South, however, a slave was held to be a man, for by doing so they hoped to increase their representation. No sooner, then, was it moved to take a census, than Williamson moved that the census should be of all free whites and three-fifths of all others.

Instantly the old division of great States and little States disappeared, and the convention was parted on the new basis of North and South. On the one hand were Delaware, South Carolina, and Georgia, demanding that slaves should have an equal representation with the whites; on the other hand were Massachusetts, Pennsylvania, and New Jersey, demanding that slaves should not be represented at all. Between the two, but leaning more towards the North, were Virginia, Maryland, and North Carolina. New York was no longer represented. Yates and Lansing, enraged at the passage of the Connecticut compromise, had gone home in a huff. Hamilton could no longer vote, and New York ceased to be considered a member of the convention.

The labor of slaves, such was the argument of delegates from the South, is as productive and as valuable in South Carolina as the labor of freemen in Massachusetts. They put up the value of land; they increase the amount of imports and exports; they may, in emergency, be turned into soldiers and used for defense; they ought, therefore, in a government set up chiefly for the protection of property and to be

supported by property, to have equal representation with the whites.

What, said their opponents, is the principle of representation? It is an expedient by which an assembly of certain men chosen by the people is put in place of the inconvenient meeting of all the people. Suppose such a meeting to take place in the South, would slaves have a vote? They would not. Why, then, should they be represented? Had a master in Virginia a number of votes in proportion to the number of his slaves? He had not. Why, then, if there is no slave representation in the States legislature, should there be slave representation in the national legislature? What, in plain language, did it mean? It meant that the man from South Carolina who went to the coast of Africa and in defiance of the most sacred laws of humanity dragged away his fellow-creatures from their dearest connections and damned them to the most cruel bondage, should have more votes, in a government formed for the protection of the rights of man, than a citizen of Pennsylvania or New Jersey who viewed such a nefarious practice with horror.

Between the two was a third party, made up of men holding a variety of views. One could not consider the negro equal to the white; yet the negro was a man, was a part of the whole population, and ought to have some representation. Another thought the Continental rule of three-fifths about right. A third was for giving slaves representation in the second branch but not in the first. They could do nothing, however, in the way of compromise, and, when a vote on the resolution for a census was taken, every State present answered *No*.

Matters were now just where they were when the report of the committee was presented. But they did not long remain so. Gouverneur Morris, in an evil hour, moved that taxation should be in proportion to representation. In the form of direct taxation the motion passed. Upon this a Southern member cried out that an attempt was being made to deprive the South of all representation of her blacks, and warned the convention that North Carolina would never confederate unless she had at least a three-fifths representation for her slaves.

The threat was indeed formidable. Whatever form of government the convention might frame would, it was well known, have to be submitted to the States for approval. It had long seemed doubtful whether enough would approve to enable any plan to go into operation. Rhode Island had refused to join the convention. The delegates from New York had gone home disgruntled. Massachusetts

was not to be counted on. Were North Carolina added to the number, the convention might as well break up, for their labors could accomplish nothing.

To appease her, therefore, the lost resolution for a census of whites and three-fifths of the blacks was again moved, and the whole matter of slavery was once more before the convention. How it should be settled was for the South to say, for of the ten States present the North could command but four. The South decided on a compromise, and the compromise offered was, to proportion representation according to direct taxation, and both representation and direct taxes according to population, counting as population all free whites and three-fifths of the negroes. When the ballot was taken North Carolina and Georgia voted yea; South Carolina was divided, and the second compromise was accepted.

On the 16th of July the report of the committee containing the two compromises came before the convention. The day was a great one, for on the vote then taken hung the fate of the Constitution. On one part of the report the States had been divided into the great against the small. On another part they had taken sides as the slaves against the free. But the vote was now on the whole report, and the States were forced to take their stand accordingly. The four little States supported it because of the compromise giving equal representation in Senate. Two of the large States opposed it for the same reason, and were joined by South Carolina and Georgia, who still insisted on a full representation of slaves. Massachusetts was divided, for King and Gorham stoutly refused to support any plan of government that gave recognition and encouragement to slavery. Everything therefore turned on the vote of North Carolina, who, to save the Constitution, deserted the great States, joined with the small, and the report passed by five votes to four.

Now each party grew very angry. Randolph was for an adjournment, that the great States might have time to decide what steps to take next, and that the small States might arrange some plan of conciliation. He was sharply answered by Paterson that it was high time to adjourn, and to adjourn *sine die*. The rule of secrecy ought to be taken off and the people consulted. As for conciliation, the small States would never conciliate except on the basis of equality of representation.

The indignation of the members from the great States at this was extreme, and early the next morning a number of them met to consider what to do. It was clear that the little States were fixed in their opposition. They had again and again asserted that they would

never give way, and they were still showing a front as determined as ever. Since, then, this partition of the convention into two fixed and opposite opinions seemed inevitable, the duty of the great States was, some said, quite plain. They represented the majority of the people of the United States. Let them, then, make ready a plan of government of their own. If the small States agreed to it, well and good. If not, so much the worse for them. Others were for yielding, though, by so doing, they did give way to a minority rule. But the conference came to nothing, and when the hour for the meeting of the convention arrived the members went to their seats in no amiable frame of mind.

The next ten days were spent in distributing power between the States and the general government; in determining how the judges should be appointed; where impeachments should be tried; what jurisdiction the Supreme Court should have; how many senators should be given to each State; whether a man must own land before he could be eligible to Congress, to the Supreme Bench, to the executive office; in what manner the Constitution should be ratified. This done, the Jersey plan, the South Carolina plan, and the twenty-three resolutions of the convention on a national government, were sent on July 26th to a committee with instructions to report a constitution. The convention then adjourned for two weeks.

On the committee were Gorham, Ellsworth, James Wilson, Randolph, and John Rutledge. Of their doings nothing is known save that, when the convention assembled on the morning of Monday, August 6th, each member was given a copy of a draft of the Constitution, neatly printed on a broadside. The type was large. The spaces between the lines were wide, that interlineations might be made, and the margin broad for noting amendments. A few of these broadsides have been preserved and, when compared with the Constitution, show that the amendments were many and important. The draft provided that the President should be chosen by Congress, should hold office during seven years, and should never, in the whole course of his life, have more than one term; the Constitution intends the President shall be chosen by a body of electors, and puts no limit to the number of his terms. By the draft he was given a title and was to be called "His Excellency"; the Constitution provides for nothing of this kind. By the draft he could be impeached by the House of Representatives, but must be tried before the Supreme Court; by the Constitution he must, when impeached, be tried before the Senate. By the one he need not be

a native of the United States; by the other he must. The one made no provision for a Vice-President; the other does. The one provided that members of Congress should be paid by the States that sent them; the other provides that they shall be paid out of the national treasury. In the draft, senators were forbidden to hold office under the authority of the United States till they had been one year out of the Senate; the Constitution makes no such requirement. By the draft, Congress was to have power to emit bills of credit, to elect a treasurer of the United States by ballot, to fix the property qualifications of its members, to pass navigation acts, and to admit new States if two-thirds of the members present in each House were willing; none of these powers are known to the Constitution. The draft provided but one way of making amendments; the Constitution provides two. Nothing was said in the draft about the passage of *ex post facto* laws, about the suspension of the habeas corpus, about granting patents to inventors and copyrights to authors, about presidential electors, or about exclusive jurisdiction over an area ten miles square. Provision was made for a clumsy way of settling quarrels between States concerning jurisdiction and domain.

As soon as the delegates had read their broadsides the work of the revision began. To the government was now given the name, "United States of America." The legislature was called "The Congress,"—the first branch the "House of Representatives," and the second branch the "Senate." The executive was named the "President." Power to emit bills of credit was stricken out. An attempt to limit representation to free inhabitants failed. An attempt to secure the return of fugitive slaves succeeded. A long series of resolutions giving Congress power to regulate affairs with the Indians; set up temporary governments for new States; grant charters of incorporation; establish a university; give a copyright to authors; encourage discoveries; advance the useful arts; have exclusive jurisdiction over the seat of government; provide for departments of war, marine, finance, commerce, domestic affairs, foreign affairs, and State; assure the payment of the public debts; guarantee the right of habeas corpus and the liberty of the press; prevent the quartering of troops on the people in time of peace; and give a privy council to the President, were readily agreed to. Indeed, but little debate was provoked till the fourth and sixth sections of the seventh article were reached.

These sections forbade Congress to lay a tax on articles exported from any State, or to tax slaves imported, or to hinder the importa-

tion of slaves in any way whatever, or pass a navigation act, unless two-thirds of the members present in each house were willing. So much as related to a tax on exports was quickly disposed of. Southern members, indeed, protested. They declared that if the power to tax exports was not given to the general government it would remain with the States; that if it remained with the States, those agricultural would be at the mercy of those commercial; that the whole South would be made tributary to the North. But their fears were pronounced unreasonable, the power was not given to Congress, and another relic of the political economy of the ancients was swept away forever. So much as related to taxing and hindering the importation of slaves had been put in to please South Carolina and Georgia. Except these two, every State was willing and eager to stop the importation of slaves. But the convention was reminded that the staples of South Carolina and Georgia were indigo and rice; that these could not be raised without slave labor; that the toil in the rice swamp and the indigo field was more than even the brawniest negro could long endure; that, if they could not bring in negroes from abroad, their industry and their property were gone; and that, sooner than submit to this, they would quit the Union.

The moment, therefore, that Luther Martin moved that the fourth section be so changed that the importation of slaves could be taxed, South Carolina declared that she would never agree to it. If the men from other States thought she would, they were greatly mistaken; they were, indeed, simply standing in their own light. Let the South have more slaves, and more rice, more indigo, more pitch and tar would be produced, and the more produced, the more for the ships of the New England men to carry. In this demand for the free importation of slaves, South Carolina was joined by Connecticut. Ellsworth and Sherman both declared that the clause ought to be left as it was. The old Confederation had not meddled with slavery, and they did not see any reason why the new one should. What enriched a part of the Union, enriched the whole, and as to what enriched them, the States were the best judges.

That slavery could enrich any land was flatly denied. Wherever it existed, Gouverneur Morris asserted, the arts languished and industry fell into decay. Compare New England, it was said, with Georgia; compare the rich farms and prosperous villages of Pennsylvania with the barren and desolate wastes of Maryland and Virginia, and see what a difference it made whether a land was cultivated by freemen or by slaves. The wealth, the

strength, the prosperity of the country depended on the labor of whites, and there could be no white labor where slavery existed.

Convinced of this truth, Maryland and Virginia had forbidden slaves to be carried to their ports. North Carolina had done almost as much. But all this would be useless if South Carolina and Georgia were free to bring in as many as they chose. Already the settlers in the growing West were clamorous for slaves to till their new lands, and would fill that country with negroes if they could be had through South Carolina. But did any one suppose they would stop when every farmer had a full supply? Were not slaves to be represented? Were not five negroes to be counted as three whites? Would not the political power of the South increase with the increase of her slaves? Here, then, was a new incentive for a free importation, a new encouragement to the traffic. More than, this, slavery corrupted manners, turned masters into petty tyrants, and was utterly inconsistent with the principles of the American Revolution and dishonorable to the American character.

All this, it was admitted, might be so. But honor, religion, humanity, had nothing to do with the question. The question was, Shall or shall not the Southern States be parties to the Union? With the slave-trade prohibited, South Carolina, for one, never would. To this it was answered, If two States will not take the Constitution, if the importation of slaves is taxed, there are other States that will not take the Constitution if the importation of slaves is not taxed. The exemption of slaves from duty when every other import is taxed, is an inequality to which the commercial States of the North and East will not submit.

At this point Gouverneur Morris proposed that the taxation of exports, of slaves imported, and the question of a navigation act, should be sent to a committee. They were, he said, fit subjects for "a bargain among the Northern and Southern States." Sherman, and Randolph, and Pinckney, and Ellsworth, and a dozen more thought so too, and the fourth and fifth sections went to a committee of five.

The sixth section soon followed them. This provided that no navigation act should be passed without the assent of two-thirds of the members present in each house, and was as hateful to the East as a restriction on the importation of slaves was to the South. The committee, therefore, had not been long in session before it was apparent that the New England States, despite the sentiments they held on slavery, were ready to make just such a bargain as Morris proposed. If the South would consent to strike out the sixth section and give Congress power to pass navigation

acts, the East would consent to the importation of slaves for a limited time. The South did consent. The bargain was struck, and the committee advised that the sixth section should be stricken out; that the fifth should be left as it was, and that the fourth should be so changed that the importation of slaves should not be forbidden before 1800.

Having obtained so much, the South wanted more, and insisted that the time should be extended till 1808. The East readily agreed, and so made good their parts of the bargain. It now remained for the South to do likewise; but the South began to object. Much was said about being in the minority, about being bound hand and foot, about having Southern trade at the mercy of the ship-owning States. If a majority of Congress could pass a navigation act, the New Englanders would shut out foreign ships, get all the carrying-trade of the country for themselves, and then demand ruinous prices for carrying tobacco, rice, and indigo to Europe. Congress ought not to have any power over trade. The most, therefore, that the South would yield was that a two-thirds vote should be necessary for the exercise of this power.

The Eastern States protested that the restriction must be taken off; that it would ruin them not to be able to defend themselves against foreign regulations. If the new government were to be so fettered as to be unable to relieve the commerce of the Eastern States, what motive could there be for them to join it? Disunion was to be lamented; but, if it came, the South would be the chief sufferer.

The majority of the Southern members had been put in good humor by the two concessions of the East, that exports should not be taxed and that slaves should be imported till 1808, and by their influence the third compromise was carried.

The convention then went on for a week striking out words here, putting in resolutions there, and bringing the draught nearer and nearer the Constitution as we now have it. On the last day of August the postponed sections and the parts of committee reports not acted on were sent to a committee of eleven. This committee reported from time to time till September 8th, when all that had been done was sent to a committee on arrangement and style. Saturday, the 15th, their work was accepted and ordered to be engrossed. On that day, as the question was about to be put for the last time, the delegates who disliked the Constitution began to make excuses for withholding their support. Mason lamented that a bare majority of Congress could pass a navigation act, and moved that no such act should be passed prior to 1808. But nothing came of it.

Randolph asked that the State conventions to which the Constitution was to be submitted might submit amendments to a second Federal convention. Mason approved this. The Constitution, he said, had been formed without the knowledge of the people. It was not right to say to them, Take this or nothing. A second convention would know their wishes. Gerry named nine features which he especially disliked.

Alarmed at this opposition, Franklin spent Sunday in preparing a little speech to be read to the dissenters. But, when Monday came, when the members were in their seats, and the Constitution, ready for signature, lay upon the table, he found himself too weak, and James Wilson read the paper for him. He was, he said, an old man, and had often, in the course of a long life, been forced to change opinions he was once sure were right. As he grew older, therefore, he had learned to doubt his own judgment and to pay more respect to the judgments of others. Steele in one of his dedications told Pope that the only difference between the Church of England and the Church of Rome in their opinion on the certainty of their doctrine was this: The Church of Rome was infallible; the Church of England was never in the wrong. He had heard of a certain French lady who, in a quarrel with her sister, said: "I do not know how it is, sister, but I meet with nobody but myself that is always in the right." Doubting his own opinion, he agreed to the Constitution with all its faults, if it had any. He had expected no better, and he was not sure that it was not the best. He hoped that each member who still had objections would do likewise, doubt a little of his own infallibility and sign the document. As a good form he would propose, "Done in convention by the unanimous consent of the States present, etc." Gouverneur Morris drew up this form, in hopes that men who would not sign as individuals would sign as State delegates. He gave it to Franklin to bring before the convention, thinking that, supported by him, it would have great weight.

As soon as Wilson had finished reading, Gorham rose and moved that the ratio of representation be changed from one for every forty thousand to one for every thirty thousand. No debate followed, and as Washington was about to put the question, he expressed a hope that the change would be made. The smallness of the proportion of representatives had always seemed to him an objectionable part of the plan.

The change was made, the form of ratification proposed by Morris was carried, the journals and papers deposited in the hands of the President, and towards evening the members

began to sign. Sixteen refused. Luther Martin had followed the examples of Yates and Lansing, had quit the convention and gone home to Maryland in disgust. Gerry feared a civil war; Randolph was convinced the consent of nine States could never be obtained; Mason was sure they were about to set up a monarchy or a tyranny, he did not know which, and none of them would sign. The rest of the sixteen carefully kept out of the room.

Washington was first to sign. When he had done so, the other delegates went up one after another in the geographical order of their States, beginning with the East. Hamilton alone signed for New York. As the Southern members were affixing their names, Franklin, looking towards the President's chair, on the back of which was cut a sun, said to those about him that painters had found it difficult to distinguish a rising from a setting sun. "I have," said he, "often and often in the course of the session, and the solicitude of my hopes and fears as to its issue, looked at that behind the President without being able to tell whether it was rising or setting. But now at length I know that it is a rising and not a setting sun."

When the convention rose that evening, it rose never to sit again.

As early as possible on the 18th of September, Major Jackson, the Secretary, set out for New York to lay the Constitution, the accompanying resolutions of the convention, and the letter of Washington before Congress. But that body was not to be the first to receive it. The legislature of Pennsylvania was in session, and to it the Constitution was read on the morning of the 18th. Copies were at once given to the printers in the city, and on the 19th, long before Major Jackson reached New York, the people of Philadelphia were reading it in the "Packet," the "Journal," and the "Gazetteer." September 20th, the documents were laid before Congress and the next day were published in the newspapers at New York.

Meanwhile such delegates to the convention as were members of Congress were hurrying back to New York; and well they might, for in Congress the enemies of the Constitution were many and strong. The delegation from New York opposed it to a man; and with them were joined Nathan Dane, William Grayson of Virginia, and R. H. Lee. Congress, they held, could give no countenance to the Constitution. That document was a plan for a new government. A new government could not be set up till the old Confederation had been pulled down, and to pull down the Confederation was not in the power of Congress, for that body could not destroy the government by whose authority it owed

existence. The answer was that Congress had sanctioned the convention, and that, if it could sanction the call for the convention it could sanction the work the convention did. But Lee and his followers would not listen to argument, and on September 26th he moved that a bill of rights and a long list of amendments should be added to the Constitution. He would have no Vice-President, more congressmen, more than a majority to pass an act regulating commerce, and a council of state to be joined with the President in making all appointments. Congress, however, would not seriously consider his amendments, and the next day it was moved that the Constitution be sent to the executives of the States, to be by them submitted to their respective legislatures. Instantly it was moved to add the words, "in order to be by them submitted to a convention of delegates to be chosen agreeably to the said resolution of the convention," and the motion was carried. It was now quite clear that neither party could have all that it wanted. The Federalists wished to send the Constitution to the States by the unanimous vote of Congress; but this they could not do so long as the delegates from New York held out. The anti-Federalists wished to send it to the States without one word of approval; but this they could not do unless the Federalists consented. When, therefore, Congress met on the 28th, each party gave up something. The anti-Federalists agreed to unanimity; the Federalists agreed to withhold all marks of approval. The amendments offered by Lee on the 26th, and the vote on the 27th, were then expunged from the journal, and the Constitution, the letter of Washington, and the resolution of the convention, were sent to the States. Twenty hours later the legislature of Pennsylvania called a State convention to consider the Constitution.

By the provisions of that instrument the ratification by nine States was to put it in force. Before the year closed Delaware and Pennsylvania and New Jersey had done so. Georgia and Connecticut followed in January, 1788. In February came Massachusetts with nine amendments. In April came Maryland, and in May South Carolina with four amendments. In June New Hampshire ratified with twelve amendments, and the list of nine States was complete. "The Good Ship Constitution," as the Federalists delighted to call that instrument, was now fairly launched. "The New Roof" was up, finished, and firmly supported by nine stout pillars, and, while the rejoicings over its completion were still going on, news came that it was to be upheld by two pillars more. Virginia and New York had ratified. Virginia offered twenty amendments

and a bill of rights; the amendments offered by New York numbered thirty-two.

Nowhere else had the contest been so long and so bitter. In some States the people disliked the Constitution because the liberty of the press was not secured, because there was to be no trial by jury in civil cases, because the name of God was not to be found in it, because there was to be no more rotation in office, because there was no bill of rights, because there was no religious qualification for office, because there were to be slave representation and the importation of slaves for one-and-twenty years. But in New York the Constitution was hated from beginning to end. Nor would the convention ratify it till the Federal members solemnly agreed that the States should be invited to a new Federal convention, to which it should be submitted for amendment. Clinton accordingly issued the call. But the States most happily did not favorably respond. Some malcontents of Pennsylvania did, indeed, hold a convention at Harrisburg in September, 1788, and there drew up some amendments which they referred to the convention called by New York. But of this action, also, nothing came. September 13th, 1788, Congress fixed upon the first Wednesday in January, 1789, as the day for choosing presidential electors, the first Wednesday in February for the meeting of the electors, and the first Wednesday in March as the day the Constitution was to become law. Five weeks later the Congress of the Confederation expired ignominiously for want of a quorum.

As yet the Constitution was without amendments. But the first session had not closed when Virginia sent in a petition begging Congress not to rise till action had been taken on those offered by the States. Madison accordingly drew up and presented to the House nine amendments, which are almost identically the nine suggested by the minority of the Pennsylvania convention in an address to their constituents. Of these in time the House made seventeen. Of the seventeen the Senate made twelve, and of the twelve, the States adopted ten, which were declared in force December 15th, 1791. Another was added in 1798, and still another in 1804; after which, though many were offered, none were accepted till the close of the Civil War.

The amendments proposed by the first Congress removed, in great part, the objections of the anti-Federalists, and the two States that were still refractory began to show signs of giving way. In November, 1789, North Carolina consented to join the Union. But six months passed, and Rhode Island held out. Then, when the United States was about to treat her as a foreign power, when the revenue laws were about to be enforced against her, when it seemed likely that a great exodus of her most worthy citizens would take place, the Federalists carried the ratification of the Constitution by a vote of 34 to 32. But the victory was not with them alone, for their opponents added a long bill of rights and twenty amendments, which, it was jeeringly said elsewhere, was more than one for each town in the State.

John Bach McMaster.

SUB PONDERE CRESCIT.

CAN this be he whose morning footstep trod
O'er the green earth as in a regal home?
Whose voice rang out beneath the sky's blue dome
Like the high utterance of a youthful god?
Now with wan looks and glance that seeks the sod
Across the twilight fields I see him roam
With sad face, lusterless as ocean-foam,
And shoulders bowed, as shrinking from the rod.
O, lift the old-time light within thine eyes!
Let loose the pristine passion from thy tongue!
Strength grows with burdens; make an end of sighs;
Let thy thoughts soar again, their mates among;
And as yon oriole's eager matins rise
Abroad once more be thy strong anthem flung!

Thomas Wentworth Higginson.

UNION PICKET POST IN FRONT OF FORT SEDGWICK AND FACING FORT MAHONE.

THE TRAGEDY OF THE CRATER.

PROBABLY at no other time during the war was there a better opportunity for a successful operation than at the springing of the mine in front of Petersburg, July 30th, 1864. While many think that the failure

on that occasion was attributable to the weakness of General Ledlie and his division, it would appear, when all the circumstances are considered, that all the blame cannot be laid at their door.

The first attempt to capture Petersburg was made on June 10th, a few days after the repulse at Cold Harbor. General Butler, who confronted Beauregard at Bermuda Hundred, on the previous day sent General Gillmore with 3000 infantry, and General Kautz with 1500 cavalry, to surprise General Wise, who held the Petersburg defenses with his brigade and a small force of militia. Early on June 10th Gillmore found the intrenchments east of the town fully manned and withdrew. Kautz approached Petersburg from the south-east, flanked the intrenchments at the Jerusalem plank-road, and advanced to the city reservoir (see map, page 765) where a show of force was made which decided General Kautz to withdraw. During the day Wise was reënforced by Dearing's brigade of cavalry.

On the evening of June 12th began Meade's movement from Cold Harbor to the James. The Fifth Corps, crossing the Chickahominy at Long Bridge, took a position to cover the White Oak Bridge and the roads from Richmond, between White Oak Swamp and Malvern Hill. On the 13th the Second Corps

passed through Charles City Court House and reached the James below Wilcox's Landing. The Sixth and Ninth corps arrived there on the 14th. The Second Corps crossed in boats from Wilcox's Landing during the night of June 14th, the day that the Fifth reached Charles City Court House. On the 15th and 16th the three other corps crossed by a ponton-bridge, touching the south bank 2 miles north of Fort Powhatan, where the river was 2100 feet wide.

General W. F. Smith embarked the Eighteenth Corps at White House, June 13th, and arrived at Point of Rocks during the night of the 14th. The next morning General Smith advanced on Petersburg with 16,000 men. Late on the 15th he assaulted the outer line of works and carried them from redans 5 to 11 (see map, page 765). During the night Lee reënforced Wise with Hoke's division and a part of Edward Johnson's division. Early the same evening Hancock's Second Corps came to the assistance of General Smith. On the 16th the Ninth Corps arrived and took position on the left of the Second Corps. Early on that day Egan's brigade captured redan 12; later, the Second Corps, assisted by two brigades of the Eighteenth Corps on the right and a similar force of the Ninth on the left, captured redans 4, 13, and 14. At dawn on the 17th General Potter's division of the Ninth Corps carried the enemy's line for a mile south of redan 14. During the night Beauregard withdrew to a new line, which was immediately intrenched, and reënforcements from General Lee began to pour in. On the 18th assaults were made by the Second, Ninth, and Fifth corps, in that order counting from the Hare house, afterward Fort Stedman, toward the left.

The Ninth Army Corps, under General Burnside, gained by these last assaults an advanced position beyond a deep cut in the railroad with-in one hundred and thirty yards of the enemy's main lines. In rear of that advanced position was a deep hollow, where work could be carried on entirely out of sight of the enemy.

A few days after gaining this position Lieutenant-Colonel Henry Pleasants, who had been a mining engineer and who belonged to the 48th Pennsylvania Volunteers, composed for the most part of miners from the upper Schuylkill coal region, suggested to General Potter, commander of the Second Division of the Ninth Corps, the possibility of running a mine under one of the enemy's forts in front of the deep hollow. This proposition was submitted to General Burnside, who approved of the measure, and work was commenced upon it on the 25th of June. If ever a man labored under disadvantages, that man was Colonel Pleasants. In his testimony before the Congressional Committee on the Conduct of the War, he said:

"The work was commenced at 12 o'clock noon, on the twenty-fourth day of June, 1864. I saw General Burnside the night previous, and commenced the mine right off the next day. . . . My regiment was only about four hundred strong. At first I employed but a few men at a time, but the number was increased as the work progressed, until at last I had to use the whole regiment — non-commissioned officers and all. The great difficulty

MAP OF THE REGION BETWEEN COLD HARBOR AND PETERSBURG.

I had was to dispose of the material got out of the mine. I found it impossible to get any assistance from anybody; I had to do all the work myself. I had to remove

all the earth in old cracker-boxes; I got pieces of hickory and nailed on the boxes in which we received our crackers, and then iron-clad them with hoops of iron taken from old pork and beef barrels. . . . Whenever I made application I could not get anything, although General Burnside was very favorable to it. The most important thing was to ascertain how far I had to mine, because if I fell short of or went beyond the proper place, the explosion would have no practical effect. Therefore I wanted an accurate instrument with which to make the necessary triangulations. I had to make them on the furthest front line, where the enemy's sharpshooters could reach me. I could not get the instrument I wanted, although there was one at army headquarters, and General Burnside had to send to Washington and get an old-fashioned theodolite, which was given to me. . . . General Burnside told me that General Meade and Major Duane, chief engineer of the Army

MAP OF DEEP BOTTOM AND BERMDA HUNDRED.

General Butler's lines extended from Port Walthall on the Appomattox to the western end of Farrar's Island in the James. There was a ponton-bridge connecting Deep Bottom with Jones's Neck, and two bridges connecting Point of Rocks with the south bank of the Appomattox. These facilitated the transfer of troops from Petersburg to Deep Bottom and back again, by which movement a part of Lee's force was drawn from Petersburg preliminary to the Union assault at the crater. — EDITOR.

of the Potomac, said the thing could not be done — that it was all clap-trap and nonsense; that such a length of mine had never been excavated in military operations, and could not be; that I would either get the men smothered, for want of air, or crushed by the falling of the earth; or the enemy would find it out and it would amount to nothing. I could get no boards or lumber supplied to me for my operations. I had to get a pass and send two companies of my own regiment, with wagons, outside of our lines to rebel saw-mills, and get lumber in that way, after having pre-

the powder on the 23d of July, 1864. With proper tools and instruments it could have been done in one-third or one-fourth of the time. The greatest delay was occasioned by taking the material out, which had to be carried the whole length of the gallery. Every night the pioneers of Colonel Pleasants' regiment had to cut bushes to cover the fresh dirt at the mouth of the gallery; otherwise the enemy could have observed it from trees inside his own lines.

The main gallery was 510¹/₈ feet in length. The left lateral gallery was 37 feet in length and the right lateral 38 feet. The magazines, 8 in number, were placed in the lateral galleries — 2 at each end a few feet apart in branches at nearly right angles to the side galleries, and 2 more in each of the side galleries similarly placed by pairs, situated equidistant from each other and the end of the galleries.

It had been the intention of General Grant to make an assault on the

viously got what lumber I could by tearing down an old bridge. I had no mining picks furnished me, but had to take common army picks and have them straightened for my mining picks. . . . The only officers of high rank, so far as I learned, that favored the enterprise was General Burnside, the corps commander, and General Potter, the division commander."

Notwithstanding the adverse circumstances at the outset, Colonel Pleasants had the whole mine, lateral galleries and all, ready to put in

enemy's works in the early part of July; but the movement was deferred in consequence of the work on the mine, the completion of which was impatiently awaited. As a diversion Hancock's corps and two divisions of cavalry had crossed to the north side of the James at Deep Bottom and had threatened Richmond. A part of Lee's army was sent from Petersburg to checkmate this move, and when the mine was

ready to be sprung Hancock was recalled in haste to Petersburg. When the mine was ready for the explosives General Meade requested General Burnside to submit a plan of attack. This was done in a letter dated July 26th, 1864, in which General Burnside said:

"... It is altogether probable that the enemy are cognizant of the fact that we are mining, because it is mentioned in their papers, and they have been heard at work on what are supposed to be shafts in close proximity to our galleries. But the rain of night before last has, no doubt, much retarded their work. We have heard no sound of workmen in them either yesterday or to-day; and nothing is heard by us in the mine but the ordinary sounds of work on the surface above. This morning we had some apprehension that the left lateral gallery was in danger of caving in from the weight of the batteries above it and the shock of their firing. But all possible precautions have been taken to strengthen it, and we hope to preserve it intact. The placing of the charges in the mine will not involve the necessity of making a noise. It is therefore probable that we will escape discovery if the mine is to be used within two or three days. It is, nevertheless, highly important, in my opinion, that the mine should be exploded at the earliest possible moment consistent with the general interests of the campaign. I state to you the facts as nearly as I can, and in the absence of any knowledge as to the meditated movements of the army, I must leave you to judge the proper time to make use of the mine. But it may not be improper for me to say that the advantages reaped from the work would be but small if it were exploded without any coöperative movement.

"My plan would be to explode the mine just before daylight in the morning or at about five o'clock in the afternoon. Mass the two brigades of the colored division in rear of my first line, in columns of division,—'double-columns closed in mass,'—the head of each brigade resting on the front line, and as soon as the explosion has taken place, move them forward, with instructions for the division to take half distance, and as soon as the leading regiments of the two brigades pass through the gap in the enemy's line, the leading regiment of the right brigade to come into line perpendicu-

lar to the enemy's line by the 'right companies on the right into line, wheel,' the left companies on the right into line, and proceed at once down the line of the enemy's works as rapidly as possible; and the leading regiment of the left brigade to execute

the reverse movement to the left, moving up the enemy's line. The remainder of the columns to move directly towards the crest in front as rapidly as possible, diverging in such a way as to enable them to deploy into column of regiments, the right column making as nearly as possible for Cemetery Hill; these columns to be followed by the other divisions of the corps as soon as they can be thrown in. This would involve the necessity of relieving these divisions by other troops before the movement, and

of holding columns of other troops in readiness to take our place on the crest, in case we gain it, and sweep down it. It would, in my opinion, be advisable, if we succeed in gaining the crest, to throw the colored division right into the town. There is a necessity for the coöperation at least in the way of artillery, by the troops on our right and left. Of the extent of this you will necessarily be the judge. I think our chances of success, in a plan of this kind, are more than even. . . . I propose to put in each of the eight magazines from twelve hundred to fourteen hundred pounds of powder; the magazines to be connected by a trough of powder instead of a fuse. I would suggest that the powder train be parked in a woods near our ammunition train, about a mile in rear of this place. Lieutenant-Colonel Pierce, chief quartermaster, will furnish Captain Strang with a guide to the place. I beg also to request that General Benham be instructed to send us at once eight thousand sand-bags, to be used for tamping and other purposes."

With a view of making the attack, the division of colored troops, under General Edward Ferrero, had been drilling for several weeks, General Burnside thinking that they were in better condition to head a charge than either of the white divisions. They had not been in any very active service. On the other hand, the white divisions had performed very arduous duties since the beginning of the campaign,* and before Petersburg had been in

colonel led the brigade, and there was no other field-officer present, the last major having been killed in the charge of June 17th; only two of the twelve captains remained. Other regiments of the division were correspondingly weak.—EDITOR.

Fig. V.

Fig. VI.

* The Fourteenth New York Heavy Artillery (serving as infantry) which led the assault had little over three hundred duty men present. It had entered the campaign at the Wilderness 1800 strong. It was divided into three battalions led by five field-officers and twelve captains. The morning of the explosion its

such proximity to the enemy that no man could raise his head above the parapets without being fired at. They had been in the habit of using every possible means of covering themselves from the enemy's fire.

General Meade objected to the use of the colored troops, on the ground, as he stated, that they were a new division, and had never

while there the message was received from General Meade that General Grant disapproved of that plan, and that General Burnside must detail one of his white divisions to take the place of the colored division. This was the first break in the original plan. There was then scarcely twelve hours, and half of that at night, in which to make this change—and no possible time in which the white

RESERVOIR HILL, WHERE KAUTZ'S ADVANCE WAS STOPPED, JUNE 10TH. (SEE PAGE 760, AND MAP, PAGE 765.)

The spires of Petersburg are seen to the left of the reservoir. In front of the reservoir is the ravine of Lieutenant's Creek that encircles the eastern outskirts of the city and afforded the Confederates a concealed and convenient way by which either wing

of their lines could be reinforced by troops from the other. Mahone's troops followed it when they were called in haste from the lines on the Confederate right to assist in repelling the Union assault at the crater.—EDITOR.

been under fire, while this was an operation requiring the very best troops. General Burnside, however, insisted upon his programme, and the question was referred to General Grant, who confirmed General Meade's views, although he subsequently said in his evidence before the Committee on the Conduct of the War:

"General Burnside wanted to put his colored division in front, and I believe if he had done so it would have been a success. Still I agreed with General Meade as to his objections to that plan. General Meade said that if we put the colored troops in front (we had only one division) and it should prove a failure, it would then be said, and very properly, that we were shoving these people ahead to get killed because we did not care anything about them. But that could not be said if we put white troops in front."

The mine was charged with only 8000 pounds of powder, instead of 14,000 as asked for, the amount having been reduced by order of General Meade; and while awaiting the decision of General Grant on the question of the colored troops, precise orders for making and supporting the attack were issued by General Meade.

In the afternoon of the 29th of July, Generals Potter and Willcox met together at General Burnside's headquarters, to talk over the plans of the attack, based upon the idea that the colored troops would lead the charge, and

troops could be familiarized with the duties expected of them.

General Burnside was greatly disappointed by this change; but he immediately sent for General Ledlie, who had been in command of the First Division only about six weeks, and upon his arrival each of the three commanders of the white divisions presented reasons why his division should *not* lead the assault. General Burnside determined that they should "pull straws," and Ledlie was the (to him) unlucky victim. He, however, took it good-naturedly, and, after receiving special instructions from General Burnside, proceeded with his brigade commanders to ascertain the way to the point of attack. This was not accomplished until after dark on the evening before the mine was to be exploded.

The order of attack, as proposed by General Burnside, was also changed by direction of General Meade, with the approval of General Grant. Instead of moving down to the right and left of the crater of the mine, for the purpose of driving the enemy from their intrenchments, and removing to that extent the danger of flank attacks, General Meade directed that the troops should push at once for the crest of Cemetery Hill.

The approaches to the Union line of intrenchments at this particular point were so

ENLARGED ENCLOSURE OF A PART OF THE OFFICIAL MAP OF THE PETERSBURG CAMPAIGN.

PROFILE OF THE GROUND BETWEEN THE CRATER AND THE MOUTH OF THE MINE.—I. (FROM A RECENT SKETCH.)

well covered by the fire of the enemy that they were cut up into a network of covered ways almost as puzzling to the uninitiated as the catacombs of Rome.*

Upon General Ledlie's return from the front orders were issued, and the division was formed at midnight. Shortly afterwards it advanced through the covered ways, and was in position sometime before daybreak, behind the Union breastworks, and immediately in front of the enemy's fort, which was to be blown up. The orders were that Ledlie's division should advance first, pass over the enemy's works, and charge to Cemetery Hill, four hundred yards to the right, and approached by a slope comparatively free from obstacles; the next division (Willcox's), as soon as the First Division should leave the works, was to advance to the left of Cemetery Hill, so as to protect the left flank of the First Division; and the next division (Potter's) was to move in the same way to the right of Cemetery Hill. The Ninth Corps being out of the way, it was intended that the Fifth and the Eighteenth corps should pass through and follow up the movement.

At 3:30 A. M. Ledlie's division was in position, the Second Brigade, Colonel E. G. Marshall in front, and that of General W. F.

Bartlett behind it, the men and officers in a feverish state of expectancy, the majority of them having been awake all night. Daylight slowly came, and still they stood with every nerve strained prepared to move forward the instant an order should be given. Four o'clock arrived, officers and men began to get nervous, having been on their feet four hours; still the mine had not been exploded. It was at this time that General Ledlie directed me to go to General Burnside and report to him that the command had been in readiness to move since 3:30 A. M., and to inquire the cause of the delay of the explosion. I found General Burnside in rear of the Fourteen-gun battery, delivered my message, and received in reply from the general that there was some trouble with the fuse dying out, but that an officer had gone into the gallery to ignite it again, and the explosion would soon take place.†

I returned immediately, and just as I arrived in rear of the First Division the mine was sprung. It was a magnificent spectacle, and as the mass of earth went up into the air, carrying with it men, guns, carriages, and timbers, and spread out like an immense cloud as it reached its altitude, so close were the Union

* The writer of this article was serving as Judge-Advocate of Ledlie's division, and also performed the duties of aide-de-camp to General Ledlie at the time of the explosion. When the orders were published for the movement, he and Lieutenant George M. Randall, also of the regular army and aide-de-camp to General Ledlie, were informed that they must accompany the advance troops in the attack, but that the volunteer

staff would remain with General Ledlie, all of whom did so, during the entire engagement, in or near a bomb-proof within the Union lines.—W. H. P.

† Sergeant Henry Rees entered the mine and found that the fuse had died out at the first splicing. He cut the fuse above the charred portion; on his way out for materials he met Lieutenant Jacob Douty, who assisted in making a fresh splice, which was a success.—EDITOR.

FIGURE 1. THE CRATER TAKEN FROM THE CRATER AND THE MOUTH OF THE MINE — II.

lines that the mass appeared as if it would descend immediately upon the troops waiting to make the charge. This caused them to break and scatter to the rear, and about ten minutes were consumed in re-forming for the attack.* Not much was lost by this delay, however, as it took nearly that time for the cloud of dust to pass off. The order was then given for the advance. As no part of the Union line of breastworks had been removed (which would have been an arduous as well as hazardous undertaking), the troops clambered over them as best they could. This in itself broke the ranks, and they did not stop to re-form, but pushed ahead towards the crater, about one hundred and thirty yards distant, the debris from the explosion having covered up the abatis and *chevaux-de-frise* in front of the enemy's works.

Little did those men anticipate what they would see upon arriving there: an enormous hole in the ground about 30 feet deep, 60 feet wide, and 170 feet long, filled with dust, great blocks of clay, guns, broken carriages, projecting timbers, and men buried in various ways — some up to their necks, others to their waists, and some with only their feet and legs protruding from the earth. One of these near me was pulled out, and he proved to be a second lieutenant of the battery which had been blown up. The fresh air revived him, and he was soon able to walk and talk. He was very grateful and said that he was asleep when the explosion took place, and only awoke to find himself wriggling up in the air; then a few seconds afterwards he felt himself descending, and soon lost consciousness.

The whole scene of the explosion struck every one dumb with astonishment as we arrived at the crest of the debris. It was impossible for the troops of the Second Brigade to move forward in line, as they had advanced;

and, owing to the broken state they were in, every man crowding up to look into the hole, and being pressed by the First Brigade, which was immediately in rear, it was equally impossible to move by the flank, by any command, around the crater. Before the brigade commanders could realize the situation, the two brigades became inextricably mixed, in the desire to look into the hole.

However, Colonel Marshall yelled to the Second Brigade to move forward, and the men did so, jumping, sliding, and tumbling into the hole, over the debris of material, and dead and dying men, and huge blocks of solid clay. They were followed by General Bartlett's brigade. Up on the other side of the crater they climbed, and while a detachment stopped to place two of the dismounted guns of the battery in posi-

MAJOR-GENERAL ROBERT E. POTTER. (FROM A PHOTOGRAPH.)

* Immediately following the explosion the heavy guns all along the line opened a severe artillery fire.

THE CRATER, AS SEEN FROM THE CONFEDERATE SIDE. (FROM A SKETCH MADE BY A CONFEDERATE ARTILLERY OFFICER ON THE MORNING OF THE EXPLOSION, AND BEFORE THE CONFEDERATE COUNTER ASSAULT.)

tion on the enemy's side of the crest of the crater, a portion of the leading brigade passed over the crest and attempted to re-form. It was at this period that they found they were being killed by musket-shots from the rear, fired by the Confederates who were still occupying the traverses and intrenchments to the right and left of the crater. These men had been awakened by the noise and shock of the explosion, and during the interval before the attack had recovered their equanimity, and when the Union troops attempted to re-form on the enemy's side of the crater, they had faced about and delivered a fire into the backs of our men. This coming so unexpectedly caused the forming line to fall back into the crater.

Had General Burnside's original plan, providing that two regiments should sweep down inside the enemy's line to the right and left of the crater, been sanctioned, the brigades of Colonel Marshall and General Bartlett could and would have re-formed and moved on to Cemetery Hill before the enemy realized fully what was intended; but the occupation of the trenches to the right and left by the enemy prevented re-formation, and there being no division, corps, or army commander present to give orders to other troops to clear the trenches, a formation under fire from the rear was something no troops could accomplish.

After falling back into the crater a partial formation was made by General Bartlett and

Colonel Marshall with some of their troops, but owing to the precipitous walls the men could find no footing except by facing inwards, digging their heels into the earth, and throwing their backs against the side of the crater, or squatting in a half-sitting, half-standing posture, and some of the men were shot even there by the fire from the enemy in the traverses. It was at this juncture that Colonel

COLONEL HENRY PLEASANTS. (FROM A PHOTOGRAPH.)

Marshall requested me to go to General Ledlie and explain the condition of affairs, which he knew that I had seen and understood perfectly well. This I did immediately.

While the above was taking place the enemy had not been idle. He had brought a battery from his left to bear upon the position, and as I started on my errand, the crest of the crater was being swept with canister. Special

ing no person present with authority to change the programme to meet the circumstances. Had a prompt attack of the troops to the right and left of the crater been made as soon as the leading brigade had passed into the crater, or even fifteen minutes afterwards, clearing the trenches and diverting the fire of the enemy, a success was inevitable, and particularly would this have been the case on the left of the cra-

THE UNION LINE AS IT APPEARED AT THE CRATER. (FROM A DRAWING MADE BY LIEUTENANT HENDERSON AFTER THE BATTLE.)

attention was given to this battery by our artillery, but for some reason or other the enemy's guns could not be silenced. Passing to the Union lines under this storm of canister, I found General Ledlie and a part of his staff ensconced in a protected angle of the works. I gave him Colonel Marshall's message, explained to him the situation, and Colonel Marshall's reasons for not being able to move forward. General Ledlie then directed me to return at once, and say to Colonel Marshall and General Bartlett that it was General Burnside's order for them to move forward immediately. This message was delivered. But the firing on the crater now was incessant, and it was as heavy a fire of canister as was ever poured continuously upon a single objective point. It was as utterly impracticable to re-form a brigade in that crater as it would be to marshal bees into line after upsetting the hive; and equally as impracticable to re-form outside of the crater, under the severe fire in front and rear, as it would be to hold a dress parade in front of a charging enemy. Here, then, was the second point of advantage lost by there be-

ter, as the small fort immediately in front of the Fifth Corps, was almost, if not entirely, abandoned for a while after the explosion of the mine, the men running away from it as if they feared that it was to be blown up also.

Whether General Ledlie informed General Burnside of the condition of affairs as reported by me I do not know; but I think it likely, as it was not long after I had returned to the crater, that a brigade of the Second Division (Potter's) under the command of Brigadier-General S. G. Griffin advanced its skirmishers and followed them immediately, directing its course to the right of the crater. General Griffin's line, however, overlapped the crater on the left, where two or three of his regiments sought shelter in the crater. Those on the right passed over the trenches, but owing to the peculiar character of the enemy's works, which were not single, but complex and invioluted and filled with pits, traverses, and bomb-proofs, forming a labyrinth as difficult of passage as the crater itself. This broke up the brigade, which, meeting the severe fire of canister, also fell back into the crater, which

was then full to suffocation. Every organization melted away, as soon as it entered this hole in the ground, into a mass of human beings clinging by toes and heels to the almost perpendicular sides. If a man was shot on the crest he fell and rolled to the bottom of the pit.

From the actions of the enemy, even at this time, as could be seen by his moving columns in front, he was not exactly certain as to the intentions of the Union commander; he appeared to think that possibly the mine explosion was but a feint and that the main attack would come from some other quarter. He, however, massed some of his troops in a hollow in front of the crater, and held them in that position.

Meantime General Potter, who was in rear of the Union line of intrenchments, being convinced that something ought to be done to create a diversion and distract the enemy's attention from this point, ordered Colonel Zenas R. Bliss, commanding his First Brigade, to send two of his regiments to support General Griffin, and with the remainder to make an attack on the right. Subsequently it was arranged that the two regiments going to the support of General Griffin should pass into the crater, turn to the right and sweep down the enemy's lines. Colonel Bliss was partly successful, and obtained possession of some two or three hundred yards of the line, and one of the regiments advanced to within twenty or thirty yards of the battery whose fire was so severe on the troops; but it could make no further headway for lack of support—its progress being impeded by slashed timber, while an unceasing fire of canister was poured into the men. They therefore fell back to the enemy's traverses and intrenchments.

At the time of ordering forward Colonel Bliss's command General Potter wrote a dispatch to General Burnside, stating that it was his opinion, from what he had seen, and from the reports he had received from subordinate officers, that too many men were being forced in at this one point; that the troops there being in confusion, it was absolutely necessary that an attack should be made from some other point of the line, in order to divert the enemy's attention and give time to straighten out our line. To that dispatch he never received an answer. Orders were, however, being constantly sent to the three division commanders of the white troops to push the men forward as fast as could be done, and this was, in substance, about all the orders that were received by them during the day up to the time of the order for the withdrawal.

When General Willcox came with the Third Division to support the First, he found the latter and three regiments of his own, together with the regiments of Potter's Second Division which had gone in on the right, so completely filling up the crater that no more troops could be gotten in there, and he therefore ordered an attack with the remainder of his division on the works of the enemy to the left of the crater. This attack was successful, so far as to carry the intrenchments for about one hundred and fifty yards; but they held them only a short time.

Previous to this last movement I had again left the crater and gone to General Ledlie, and had urged him to try to have something done to the right and left of the crater—saying that every man who got into the trenches to the right or left of it used them as a means of escape to the crater, and the enemy was reoccupying them as fast as our men left. All the satisfaction I received was an order to go back and

tell the brigade commanders to get their men out and press forward to Cemetery Hill. This talk and these orders, coming from a commander sitting in a bomb-proof inside the Union lines, were disgusting. I returned again to the crater and delivered the orders, which I knew beforehand could not possibly be obeyed; and I told General Ledlie so before I left him. Upon my return to the crater, I devoted my attentions to the movements of the enemy, who was evidently making dispositions for an assault.

About two hours after the explosion of the mine (7 o'clock) and after I had returned to the crater for the third time, General Ferrero, commanding the colored division of the Ninth Corps, received an order to advance his division, pass the white troops which had halted, and move on to carry the crest of Cemetery Hill at all hazards. General Ferrero did not think it advisable to move his division in, as there were three divisions of white troops already huddled together, so he reported to Colonel Charles G. Loring, of General Burnside's staff, who requested Ferrero to wait until he could report to General Burnside. General Ferrero declined to wait, and then Colonel Loring gave him an order, in General Burnside's name, to halt without passing over the Union works, which order he obeyed. Colonel Loring went off to report to General Burnside, came back, and reported that the order was peremptory for the colored division to advance at all hazards.

The division then started in, moved by the left flank, under a most galling fire, passed around the crater on the crest of the débris, and all but one regiment passed beyond the crater. The fire upon them was incessant and severe, and many acts of personal heroism were done here by officers and men. Their drill for this object had been unquestionably of great benefit to them, and had they led the attack, fifteen or twenty minutes from the time the débris of the explosion had settled I would have found them at Cemetery Hill, before the enemy could have brought a gun to bear on them.

But the leading brigade struck the enemy

* A *file-closer* of one of the colored regiments [Lieutenant-Colonel John A. Bross] seized a stand of Union's colors as he saw his men filtering when they first met the withering fire of the enemy, and mounting the very highest portion of the crest of the crater, waved the colors zealously amid the storm of shot and canister. The gallant fellow was soon struck to the earth.

While this was taking place, an amusing occurrence happened in the crater. As the colored column was moving by the left flank around the edge of the crater to the right, the file-closers, on account of the narrowness of the way, were compelled to pass through the mass of white men inside the crater. One of these file-

which I had previously reported as massed in front of the crater, and in a sharp little action the colored troops captured some two hundred prisoners and a stand of colors and recaptured a stand of colors belonging to a white regiment of the Ninth Corps. In this almost hand-to-hand conflict, the colored troops became somewhat disorganized, and some twenty minutes were consumed in re-forming; then they made the attempt to move forward again. But, unsupported, subjected to a galling fire from batteries on the flanks and from infantry fire in front and partly on the flank, they broke up in disorder and fell back to the crater, the majority passing on to the Union line of defenses, carrying with them a number of the white troops who were in the crater and in the enemy's intrenchments.*

Had any one in authority been present when the colored troops made their charge, and had they been supported, even at that late hour in the day there would have been a possibility of success; but when they fell back and broke up in disorder, it was the closing scene of the tragedy. The rout of the colored troops was followed up by a feeble attack from the enemy, more in the way of a reconnaissance than a charge; but the attack was repulsed by the troops in the crater and the intrenchments connected therewith, and the Confederates retired.

It was now evident that the enemy did not fear a demonstration from any other quarter, as they began to collect their troops for a decisive assault. On observing this, I left the crater and reported to General Ledlie, whom I found seated in a bomb-proof with General Ferrero, that some means ought to be devised for withdrawing the mass of men from the crater without exposing them to the terrific fire which was kept up by the enemy; that if some shovels and picks could be found, the men in an hour could open a covered way by which they could be withdrawn; that the enemy was making every preparation for a determined assault on the crater, and, disorganized as the troops were, they could make no permanent resistance. Not an implement of any kind could be found, indeed the prop-

closer was a massively built, powerful, and well-formed sergeant, stripped to the waist—his coal-black skin shining like polished ebony in the strong sunlight. As he was passing up the slope to emerge on the enemy's side of the crest, he came across one of his own black fellows who was lagging behind his company, evidently with the intention of remaining inside the crater, out of the way of the bullets. He was accosted by the sergeant with "None ob yo' d—n skulkin,' now," with which remark he seized the culprit with one hand, and, lifting him up in his powerful grasp by the waistband of his trousers, carried him to the crest of the crater, threw him over on the enemy's side, and quickly followed.—W. H. P.

osition was received with disfavor. Matters remained *in statu quo* until about 2 P. M., when the enemy's anticipated assault was made.

OUTER WORKS OF FORT SEDGWICK.

FORT SEDGWICK, KNOWN AS "FORT HELL," OPPOSITE THE CONFEDERATE FORT MAHONE, KNOWN AS "FORT DAMNATION." (FROM PHOTOGRAPHS.)

About 9:30 A. M. General Meade had given positive orders to have the troops withdrawn from the crater. To have done so, under the severe fire of the enemy, would have produced a stampede, which would have endangered the Union lines, and might possibly have communicated itself to the troops that were massed in rear of the Ninth Corps. General Burnside thought, for these and other reasons, that it was possible to leave his command there until nightfall, and then withdraw it. There was no means of getting food or water to them, for which they were suffering. The midsummer sun shone upon their heads until waves of moisture produced by the exhalation from this mass slowly arose in perceptible horizontal layers; wounded men died there begging piteously for a drink of water—a drop of which was not to be had, for the men had long since drained their canteens. Soldiers extended their tongues to dampen their parched lips until they seemed to hang from their mouths like those of thirsty dogs, and yet they were kept waiting in this almost boiling cauldron, suffering with thirst and worn out with their all-

night preparations and their fearful morning's work.

While the hours were thus wasted in the time and means necessary to extricate the human mass from its now perilous position, the enemy, having taken advantage of our inactivity to mass his troops, was seen to emerge from the bushes which grew in the swale between the hill on which the crater was situ-

BOMB-PROOFS INSIDE FORT SEDGWICK.

ated and that of the cemetery. On account of this depression they could not be seen by our artillery, and hence no guns were brought to bear upon them. The only place where they could be observed was from the crater. But there was no serviceable artillery there, and no sufficiently organized infantry force to offer resistance when the enemy's column pressed forward. All in the crater who could possibly hang on by their elbows and toes lay flat against its conical wall and delivered their fire; but not more than a hundred men at a time could get into position, and these were only armed with muzzle-loading guns, and in order to re-load, they were compelled to face about and place their backs against the wall.

The enemy's guns suddenly ceased their long continued and uninterrupted fire on the crater, and the advancing column charged in the face of feeble resistance offered by the Union troops. At this stage they were perceived by our artillery, which opened a murderous fire, but too late. Over the crest and into the crater they poured, and a hand-to-hand conflict ensued. It was of short duration, however; crowded as our troops were, and without organization, resistance was vain. Many men were bayoneted at that time — some probably that would not have been, except amid the heat and excitement of battle. About 87 officers* and 1652 men of the Ninth Corps were captured, the remainder retiring to our own lines, to which the enemy did not attempt to advance.

In the engagements of the 17th and 18th of June, in order to obtain the position held by the Ninth Corps at the time of the explosion, the three white divisions had 29 officers and 348 men killed; 106 officers and 1851 men wounded; and 15 officers and 554 men missing — total, 2903. From the 20th of June to the day before the crater fight of July 30th these same divisions lost in the trenches 12 officers and 231 men killed; 44 officers and 851 men wounded; and 12 men missing — total, 1150. These casualties were caused by pocket and shell firing, and extended pretty evenly over the three divisions. The whole of General Willcox's division was on the line for thirty days or more without relief. General Potter's and General Ledlie's divisions had slight reliefs, enabling those officers to draw some of their men off at intervals for two or three days at a time.

In the engagement of July 30th, the four divisions of the Ninth Corps had 52 officers and 376 men killed; 105 officers and 1556 men wounded; and 87 officers and 1652 men missing (captured) — total, 3828.†

It was provided in General Meade's order for the movement that the cavalry corps should make an assault on the left. Two divisions of the cavalry were over at Deep Bottom. They could not cross the river until after the

Second Corps had crossed, so that it was late in the day before they came up. Indeed, the head of the column did not appear before the offensive operations were suspended. As General James H. Wilson had been ordered to be in readiness, and in view of the unavoidable delay of General Sheridan, orders were sent to Wilson not to wait for General Sheridan, but to push on himself to the Weldon railroad. But the length of the march prevented success; so no attack was made by the cavalry, except at Lee's Mills, where General Gregg, encountering cavalry, drove them away in order to water his horses.

The Fifth Corps and the Eighteenth Corps remained inert during the day, excepting Tur-

SIDES AND EDGE OF TWO BULLETS THAT MET POINT TO POINT AT THE CRATER — THE SIDES FROM PHOTOGRAPHS OF THE ORIGINAL IN MAJOR GRIFFITH'S MUSEUM AT THE CRATER.

ner's division of the Eighteenth, which made an attempt on the right of the crater, but it happened to be just at the time that the colored troops broke up; so his command was thrown into confusion, and fell back to the trenches.

In this affair the several efforts made to push troops forward to Cemetery Hill were as futile in their results as the dropping of handfuls of sand into a running stream to make a dam. With the notable exception of General Robert B. Potter, not a division commander was in the crater or connecting lines, nor was there a corps commander on the immediate scene of action; the result being that the subordinate commanders attempted to carry out the orders issued prior to the commencement of the action, when the very first attack developed the fact that a change of those plans was absolutely necessary.

William H. Powell.

* General William F. Bartlett was among the captured. Earlier in the war he had lost a leg, which he replaced with a patent cork leg. While he was standing in the crater, a shot was heard to strike with the peculiar thud known to those who have been in action, and the general was seen to totter and fall. A number of officers and men immediately lifted him, when he cried out, "Put me any place where I can sit down."

"But you are wounded, General, aren't you?" was the inquiry.

"My leg is shattered all to pieces," said he.

"Then you can't sit up," they urged, "you'll have to lie down."

"Oh, no!" exclaimed the general, "*it's only my cork leg that's shattered!*" — W. H. P.

† General Meade reported the losses of his army in the assault on the crater at 4400 killed, wounded, and missing, all except about 100 being in the Ninth Corps. General Mahone states that the number of prisoners taken was 1101. The loss in Lee's army is not fully reported. Elliott's brigade lost 677, and that was probably more than half of the casualties on the Confederate side. — EDITOR.

THE DASH INTO THE CRATER.

UNION RAILROAD BATTERY, PETERSBURG. FROM A PHOTOGRAPH.

THE story of the dash into the Petersburg crater and the struggle there, with the thrilling experiences of the men engaged, is too broad for one witness to cover, but the record of one regiment will convey a fair idea of what the battle was. The selection of troops to lead the assault was settled on the eve of the movement, but the plans and purposes for the day were not communicated to any soldier below the rank of field-officer. There were indications of a forward movement that the privates could well interpret, such as orders for extra rations, the concentration of troops, and the massing of lines of battle close to the enemy's works in front of Cemetery Hill. The honor of leading the assault came by rotation to Colonel E. G. Marshall's brigade. During the night his regiments were marched to a position about twenty rods from the mine, where a single breastwork, an old Confederate work, turned, lay between them and the fort. The condition of this work was not pointed out to the men, nor was any notice given them of what would occur or what was expected in the emergency before them. The men dozed and rested a couple of hours before daylight, awaiting developments. Suddenly the earth trembled, and a black pyramid shot into the air, so close that it seemed as though in spreading after the upward force was spent it would fall on and crush those nearest. It was so startling that the first two lines of men broke, for it was believed to be an earthquake or a Confederate mine sprung upon us. No one believed that a Confederate fort was so near. The 14th New York Heavy Artillery, to which I belonged, formed the third line, and was Colonel Marshall's own regiment. With two lines in front and the familiar presence of their own

commander to encourage them, these men remained comparatively steady, although there was confusion for a brief spell. Just how far this confusion set back the movement will be seen from the experiences of the first moments. Lieutenant Thomson, of Company B, was thrown into a mudhole by the shock, and just as he came up blinded and bespattered before his astonished soldiers, the call rang out, "Forward!" Forward meant across those breastworks in front, and these were as high as a man's shoulder. There were no steps or ladders, and this unlucky lieutenant scraped the mud from his eyes, repeated the orders, and climbed up the logs, for the works at the time were more like a high terrace wall than a field breastwork. Some of the men put bayonets into the wall and made steps, and a few stood on the top and lent hands to their fellows. When twenty men of Company B had joined their lieutenant on the works, he ordered them to align, but Colonel Marshall called out, "No time for that, Lieutenant; go for the crest." So it stood with the whole regiment, and but a handful were ready at the first jump. These charged in companies, by the flank. Our artillery opened at once and shells went screaming overhead, and puffs and clouds of smoke from the shell and from the yawning pit made by the explosion obscured the view and added to the confusion. About one hundred and fifty men were close to Colonel Marshall and the colors, and more came straggling on as fast as they could get over the works, and the grand dash was made by this handful. At the crater a slanting pit was open, and on each side of it the Confederates were now alert, although they were not cool enough for action. In the pit, powder smoke issued from the crevices; guns were seen half buried; the heads or limbs of half-buried men wriggled in the loose earth. The command came again, "Go ahead!" There was a section of the exploded work remaining, and here and in the breastworks alongside men were seen. In front, beyond the hole, a Confederate battery was firing into the pathway from our works, and a shot cut a man of Company C in two. The men in the pit and near it surrendered or ran away and the flag of the 14th New York Heavy Artillery was planted on the site of the old fort. The enemy on the flanks and beyond came to their senses at sight of this flag and opened with bullets. Our men saw that all around them

were superior numbers, and even from the rear they received a fire, for there were traverses running toward our own lines that sheltered men while firing across the plateau and, reversely, into the crater. Still the determination was to push on, and a dash was made for the second breastwork. Here the Confederates made a stand. Some of our men got so close that guns were clubbed, and Sergeant James S. Hill of Company C took a regimental battle-flag by force. The fire from all sides was hot, and the men fell back to the old fort and into the crater. It seemed now to those on the spot that the best thing to do was to defend the breach as a basis for forward movements, for there were Confederates all about, possibly in numbers sufficient to recapture it. Colonel Marshall and some of his officers and men got the old cannon into position and opened on the Confederates that were nearest.* By this time other regiments had come up, and the 2d Pennsylvania Heavy Artillery, of our brigade, joined in this work. General Hartranft came in with a command, and when he saw the action of Marshall's men, called out, "Three cheers for the 14th!" The brigades following Marshall's moved against the breastworks on the flanks of the crater, but they had to face artillery and muskets at every step, and as the lines broke the men inevitably came to the crater. There were now on the scene detachments from several commands without a supreme commander. Officers and men alike called for definite purposes and orders. Our brigade had entered the breach and could not advance until the flanks were cleared. The brigades sent after us to clear the flanks had been beaten off and had taken refuge in the pit. Difficulties increased every second, because the Confederates grew bolder and their fire began to tell. Every fresh advance

from our supports was anxiously watched, but in the end despairing curses went up because the unsuccessful columns fell back and packed the overcrowded hole. The wounded men came into the pit in preference to going to our own lines, because the way back was swept by the enemy. After the first hour the scene in the crater was terrible. Refugees found that shots fell there as well as outside, and many who came in looking for safety met disaster. The last rally was when the colored division

moved out from our works in splendid or-

RELICS IN THE CRATER MUSEUM.

1. Musket barrel with bullet-hole at the muzzle. 2. Musket with two bullets meeting in the barrel, a bullet having entered the muzzle and the gun was discharged. 3. Musket struck by six bullets, one bullet being lodged in the barrel near the bayonet. 4. Musket that has been cocked and capped. 5. Musket with a bayonet fixed to the blade. 6. A sword found in a handkerchief. 7. Broken sword. 8. Lining of a cartridge box. 9. Canteen perforated by bullets. 10. Shovel having bullet-hole, found on the Union picket line in front of the crater. 11. Frying pan having bullet holes, taken out of the crater.

der, which promised us success. Growlers were now put to shame, and the most of the men fell into line, to go forward. Some few declared that they would never follow "niggers" or be caught in their company, and started back to our own lines but were promptly driven forward again. Then the colored troops broke and scattered, and pandemonium began. The bravest lost heart, and the men who distrusted the negroes vented their feelings freely. Some colored men came into the crater, and there

they found a worse fate than death in the charge. It was believed among the whites that the enemy would give no quarter to ne-

* In the section of the fort not destroyed by the explosion were rifle cannon, dismounted. Here portions of my company and of other companies remained dur-

ing the lulls in action, not entering the crater proper. But we could overlook the whole scene when not distracted by the rush of sensations.—G. I. K.

groes, or to the whites taken with them, and so to be shut up with blacks in the crater was equal to a doom of death. The officers began to scheme for a retreat. At the time there were one general of division and four brigade commanders on the spot,—R. B. Potter, E. G. Marshall, S. G. Griffin, W. F. Bartlett, and John F. Hartranft. Orders came to withdraw the men, but the space between the hole and our works was commanded at every point by Confederate artillery and sharp-shooters. The road was corduroyed with bodies of the fallen. The commandant of the First Battalion of the 14th Regiment, Captain Houghton, Company L, proposed to lead his men back, but they all preferred to remain, and the general officers advised all hands to wait. One plan was to send for spades, and have two parties at work at either end digging a ditch for passage. Another was to wait until nightfall. Both plans were cut short by the action of the enemy. Two or three small parties advanced on the crater, and were repulsed; yet reënforcements were coming up, and it was evident that the spot must be abandoned. Captain Houghton watched the men who attempted to cross back to the works and saw that a gun throwing case-shot did most of the damage to the retreat. After a discharge of this gun he started and passed its range before another discharge came. In crossing the space he found it planted so thick with the fallen that he could not avoid stepping on them. As soon as he reached the works, he directed a sharp musketry fire upon the points whence the hottest Confederate fire came and partly silenced it, so that a few more men got home safely. Colonel Marshall and General Bartlett were among those who remained in the crater and were captured.

The experiences of these men at capture must be told from recollections of survivors after a long captivity ending with the war. It has been positively asserted that white men bayoneted blacks who fell back into the crater. This was in order to preserve the whites from Confederate vengeance. Men boasted in my presence that blacks had thus been disposed of, particularly when the Confederates came up. Many of the prisoners died in Andersonville, and it is impossible to get good accounts of the closing moments, the time of hand-to-hand work between whites and blacks in the crater and the Confederates who came in. A man who kept tally when the bodies in the hole were buried by the enemy recorded one hundred and forty-seven white and black Union soldiers found in the pit itself. Some of them may have been mortally wounded outside, and some were killed

by shots falling into the crater. Sergeant Hill, our comrade who captured the Confederate flag, met death that morning, and a medal of honor was awarded for his action. This flag is now in the War Department collection fully identified on the record.

There were many scenes here to move the strongest hearts. When the débris of the explosion was in the air men's bodies could be distinguished, and of course it flashed upon every mind that a horrible fate had overtaken fellow-men. On one of the elevations in the crater, a Confederate was seen struggling with his head and shoulders buried and held fast. Our men attempted to relieve him, but were driven away by Confederate bullets. On each side of the hole were counter-shafts about fifty feet deep standing open. Down one of these a Confederate had fallen and lay there alive and moaning, but there was no means for his relief at hand. These counter-shafts had been run perpendicularly and abandoned. The Confederate prisoners stated that the fort was full of men that night, for our movements in front had been noticed, and an assault was expected and preparations had been made to receive it. The explosion, however, was wholly unexpected.

The wisdom of selecting the Ninth Corps for the assault has been questioned by high authority. The quality of men for this kind of work depends on their present spirit, commonly called the *morale*. This condition is easily affected and is an uncertain quantity among the very best troops. Three points may be noted as to the spirit of our corps at the time, and the same would be true of the other corps of the army. First, there was a feeling that the soldiers had been pushed persistently into slaughter-pens, from the Wilderness down, and needlessly sacrificed by such methods. Second, there was a determination to rebel against further slapdash assaults. Third, the strongest element of all, as affecting the general spirit, was the all-powerful ambition to take Petersburg and end the struggle. It was universally felt by the men in the breach that the explosion of the mine was a means to that end. But the first assaulting columns would not go on and seize the crest without supports, and these supports did not come. There was not an instant from the moment of the explosion up to the time when the negroes came on that the whites would not have rallied to a man and risked everything in a combined and well-directed charge upon the crest. The men knew that success lay in a strong movement, and they refused to go out in weak detachments.

George L. Kilmer.

THE COLORED TROOPS AT PETERSBURG.

EAST of Petersburg, on high ground, protruding like the ugly horn of a rhinoceros, stood the Confederate earth-work, fortified as a battery, which we undermined and exploded July 30th, 1864. It did a good deal of goring before we destroyed it. Its position enabled the garrison to throw a somewhat enfilading fire into our lines, under which many fell, a few at a time.

For some time previous to the explosion of the mine it was determined by General Burnside that the colored division* should lead the assault. The general tactical plan had been given to the brigade commanders (Colonel Sigfried and myself), with a rough outline map of the ground, and directions to study the front for ourselves. But this latter was impracticable except in momentary glimpses. The enemy made a target of every head that appeared above the work, and their marksmanship was good. The manner of studying the ground was this: Putting my battered old hat on a ramrod and lifting it above the rampart just enough for them not to discover that no man was under it, I drew their fire; then, stepping quickly a few paces one side, I took a hasty observation.

We were all pleased with the compliment of being chosen to lead in the assault. Both officers and men were eager to show the white troops what the colored division could do. We had acquired confidence in our men. They believed us infallible. We had drilled certain movements, to be executed in gaining and occupying the crest. It is an axiom in military art, that there are times when the ardor, hopefulness, and enthusiasm of new troops not yet rendered doubtful by reverses or chilled by defeat, more than compensate, in a dash, for

training and experience. General Burnside, for this and other reasons, most strenuously urged his black division for the advance. Against his most urgent remonstrance he was overruled. About 11 p. m., July 29th, a few hours before the action, I was officially informed that the whole plan had been changed, and our division would not lead.

We were then bivouacking on our arms in rear of our line, just behind the covered way leading to the mine. I returned to that bivouac dejected and with an instinct of disaster for the morrow. As I summoned and told my regimental commanders, their faces expressed the same feeling. I considered it unnecessary to inform the captains that night, and they were allowed to sleep on.

Any striking event or piece of news was usually eagerly discussed by the white troops, and in the ranks military critics were as plenty and perhaps more voluble than among the officers. Not so with the blacks; important news such as that before us, after the bare announcement, was usually followed by long silence. They sat about in groups, "studying," as they called it. They waited, like the Quakers, for the spirit to move; when the spirit moved, one of their singers would uplift a mighty voice, like a bard of old, in a wild sort of chant. If he did not strike a sympathetic chord in his hearers, if they did not find in his utterance the exponent of their idea, he would sing it again and again, altering sometimes the words, or more often the music. If his changes met general acceptance, one voice after another would chime in; a rough harmony of three parts would add itself; other groups would join his, and the song became the song of the command.

The night we learned that we were to lead the charge the news filled them too full for ordinary utterance. The joyous negro guffaw always breaking out about the camp-fire ceased. They formed circles in their company streets and were sitting on

* There was but one Division of colored troops in the Army of the Potomac — the Fourth Division of the Ninth Corps — organized as follows:

Brigadier-General Edward Ferrero, commanding division. *First Brigade*: Colonel Joshua K. Sigfried (of the 48th Penn.); 27th U. S. colored troops, Lieutenant-Colonel Charles J. Wright; 28th U. S. colored troops, Colonel Delevan Bates; 29th U. S. colored troops, Colonel George P. Stewart; 31st U. S. colored troops, Lieutenant-Colonel H. Seymour Hall. *Second Brigade*: Colonel Henry Goddard Thomas, 19th U. S. colored troops; 19th U. S. colored troops, Lieutenant-

Colonel Joseph G. Perkins; 23d U. S. colored troops, Colonel Cleveland J. Campbell; Battalion of six companies 28th U. S. colored troops, Lieutenant-Colonel Charles S. Russell; 29th U. S. colored troops, Lieutenant-Colonel John A. Bross; 31st U. S. colored troops, Lieutenant-Colonel W. E. W. Ross.

This made a division of only nine regiments, divided into two brigades, yet it was numerically a large division. The regiments were entirely full, and a colored deserter was a thing unknown. On the day of the action the division numbered 4300, of which 2000 belonged to Sigfried's brigade and 2300 to mine. — H. G. T.

SONG OF THE COLORED DIVISION BEFORE CHARGING INTO THE CRATER.

the ground intently and solemnly "studying." At last a heavy voice began to sing, "We-e looks li-ike me-en a-a marchin' on, we looks li-ike men-er-war." Over and over again he sang it, making slight changes. The rest watched him intently; no sign of approval or disapproval escaped their lips, or appeared on their faces. All at once, when his refrain had struck the right response in their hearts, his group took it up, and shortly half a thousand voices were upraised. It was a picturesque scene,—these dark men, with their white eyes and teeth and full red lips crouching over a smoldering camp-fire, in dusky shadow, with only the feeble rays of the lanterns of the first sergeants and the lights of the candles dimly showing through the tents. The sound was as weird as the scene, when all the voices struck the low "E" (last note but one), held it, and then rose to "A" with a *portamento* as sonorous as it was clumsy. Until we fought the battle of the crater they sang this every night to the exclusion of all other songs. After that defeat they sang it no more.

About 3 A. M. the morning of the battle we were up after a short sleep under arms. Then came the soldiers' hasty breakfast. "Never fight on an empty stomach" was a proverb more honored in that army than any of Solomon; for the full stomach helped the wounded man to live through much loss of blood. This morning our breakfast was much like that on other mornings when we could not make fires: two pieces of hard-tack with a slice of raw, fat salt pork between—not a dainty meal, but solid provender to fight on. By good fortune I had a bottle of cucumber pickles. These I distributed to the officers about me. They were gratefully accepted, for nothing cuts the fat of raw salt pork like a pickle. We moistened our repast with black coffee from our canteens. The privates fared the same, barring the luxury of the pickle.

We had been told that the mine would be fired at 3:45 A. M. But 4 o'clock arrived, and all was quiet. Not long after that came a dull, heavy thud, not at all startling; it was a heavy smothered sound, not nearly so distinct as a musket-shot. Could this be the mine? No; impossible. There was no charging, no yells, neither the deep-mouthed bass

growl of the Union troops, nor the sharp, shrill, fox-hunting cry of the Confederates. Here was a mine blown up, making a crater from 150 to 200 feet long, 60 wide, and 30 deep, and the detonation and the concussion were so inconsiderable to us, not over a third of a mile away, that we could hardly believe the report of a staff-officer, back from the line, that the great mine had been exploded.

At about 5:30 A. M. a fairly heavy musketry fire from the enemy had opened. Shortly after, as we lay upon our arms awaiting what orders might come, a quiet voice behind me said, "Who commands this brigade?" "I do," I replied. Rising, and turning toward the voice, I saw General Grant. He was in his usual dress: a broad-brimmed felt hat, and the ordinary coat of a private. He wore no sword. Colonel Horace Porter, his aide-de-camp, and a single orderly accompanied him. "Well," said the general, slowly and thoughtfully, as if communing with himself rather than addressing a subordinate, "why are you not in?" Pointing to the First Brigade just in my front, I replied, "My orders are to follow that brigade." Feeling that golden opportunities might be slipping away from us, I added, "Will you

MAJOR-GENERAL EDWARD FERRERO, COMMANDING THE COLORED DIVISION. (FROM A PHOTOGRAPH.)

give me the order to go in now?" After a moment's hesitation he answered, in the same slow and ruminating manner, "No, you may keep the orders you have." Then, turning his horse's head, he rode away at a walk.

Fifteen minutes later an aide to the division commander gave us the order and we moved into the covered-way, my brigade following Sigfried's. This was about 6 A. M. For an hour or more we lay here inactive, the musketry growing quicker and sharper all the time. A heavy cannonading opened. We sat down at first, resting against the walls of the covered-way. Soon, however, we had to stand to make room for the constantly increasing throng of wounded who were being brought past us to the rear. Some few, with flesh-wounds merely, greeted us with such jocularity as, "I'm all right, boys! This is good for a thirty days' sick-leave!" Others were plucky and silent, their pinched faces telling the effort they were making to suppress their groans; others, with the ashy hue of death already gathering on their faces, were largely past pain. Many, out of their senses through agony, were moaning or bellowing like wild beasts. We stood there over an hour with this endless procession of wounded men passing. There could be no greater strain on the nerves. Every moment changed the condition from that of a forlorn hope to one of forlorn hopelessness. Unable to strike a blow, we were sickened with the contemplation of revolting forms of death and mutilation.

Finally, about 7:30 A. M., we got the order for the colored division to charge. My brigade followed Sigfried's at the double-quick. Arrived at the crater, a part of the First Brigade entered. The crater was already too full; that I could easily see. I swung my column to the right and charged over the enemy's rifle-pits connecting with the crater on our right. These pits were different from any in our lines — a labyrinth of bomb-proofs and magazines, with passages between. My brigade moved gallantly on right over the bomb-proofs and over the men of the First Division.* As we mounted the pits, a deadly enfilade from eight guns on our right, and a murderous cross-fire of musketry decimated us. Among the officers, the first to fall was the gal-

lant Fessenden of the 23d regiment. Ayres and Woodruff of the 31st dropped, killed, within a few yards of Fessenden. Liscomb of the 23d then fell to rise no more; and then Hackiser of the 28th and Flint and Aiken of the 29th. Major Rockwood of the 19th then mounted the crest and fell back

dead, with a cheer on his lips. Nor were these all; for at that time hundreds of heroes "carved in ebony" fell. These black men commanded the admiration and respect of every beholder on that day.

The most advantageous point for the purpose, about eight hundred feet from the crater, having been reached, we leaped from the works and endeavored to make a rush for the crest. Captain Mar-

shall L. Dempcy, and Lieutenant Christopher Pennell, of my staff, and four white orderlies with the brigade guidon accompanied me, closely followed by Lieutenant-Colonel Ross, leading the 31st regiment. At the instant of leaving the works Ross was shot down; the next officer in rank, Captain Wright, was shot as he stooped over him. The men were largely without leaders, and their organization was destroyed. Two of my four orderlies were wounded; one, flag in hand; the remaining two sought shelter when Lieutenant Pennell, rescuing the guidon, hastened down the line outside the pits. With his sword uplifted in his right hand and the banner in his left, he sought to call out the men along the whole line of the parapet. In a moment, a musketry fire was focused upon him individually, whirling him round and round several times before he fell. Of commanding figure, his bravery was so conspicuous, that, according to Colonel Weld's testimony, a number of his (Weld's) men were shot because, spell-bound, they forgot their own shelter in watching this superb boy, who was an only child of an old Massachusetts clergyman, and to me as Jonathan was to David. Two days later, on a flag of truce, I searched for his body in vain. He was doubtless shot literally to pieces, for the leaden hail poured for a long time almost incessantly about that spot, killing the wounded and mutilating the dead; and he probably sleeps among the unknown whom we buried in the long deep trench we dug that day.†

LIEUTENANT CHRISTOPHER PENNELL.
(FROM A PHOTOGRAPH.)

* Major Van Buren's testimony, "Report of Committee on the Conduct of the War," Vol. I.

† While the contemplation of one death so softens the heart, the sight of the myriad dead of a battle-field blunts the sensibilities. During the burial of the dead,

I saw a striking instance of this. A stretcher-bearer, seeing that the trousers-pocket of a soldier long dead contained part of a plug of tobacco, deliberately cut it out, and, taking a chew with an air of relish, transferred the rest to his own pocket.— H. G. T.

UNION TROOPS.

THE BATTLE OF THE CRATER. (FROM THE PAINTING BY J. A. ELDER.)

CONFEDERATES CHARGING.

The men of the 31st making the charge were being mowed down like grass, with no hope of any one reaching the crest, so I ordered them to scatter and run back. The fire was such that Captain Dempcy and myself were the only officers who returned, unharmed, of those who left the works for that charge.*

We were not long back within the honey-comb of passages and bomb-proofs near the crater before I received this order from the division commander: "Colonels Sigfried and Thompson, if you have not already done so, you will immediately proceed to take the crest in your front." My command was crowded into the pits, already too full, and were sandwiched, man for man, against the men of the First Division. They were thus partly sheltered from the fire that had reduced them coming up; but their organization was almost lost. I had already sent word to General Burnside by Major James L. Van Buren of his staff, that unless a movement simultaneous with mine was made to the right, to stop the enfilading fire, I thought not a man would live to reach the crest; but that I would try another charge in about ten minutes, and I hoped to be supported. I then directed the commanders of the 23d, 28th, and 29th regiments to get their commands as much together and separated from the others as possible in that time, so that each could have a regimental following, for we were mixed up with white troops and each other to the extent of almost paralyzing any effort. We managed to make the charge, however, Colonel Bross of the 29th leading. The 31st had been so shattered, was so diminished, so largely without officers, that I got what was left of them out of the way of the charging column as much as possible. This column met the same fate in one respect as the former. As I gave the order, Lieutenant-Colonel John A. Bross, brother of Lieutenant-Governor Bross, of Ohio, taking the flag into his own hands, was the first man to leap from the works into the valley of death below. He had attired himself in full uniform, evidently with the intent of inspiring his men. He had hardly reached the ground outside the works before he fell to rise no more. He was conspicuous and magnificent in his gallantry. The black men followed into the jaws of death, and advanced until met by a charge in force from the Confederate lines.

The report of the Confederate General Bushrod Johnson, to which I have had access, says that the Confederate troops in this charge were the first brigade of Mahone's division, with the 25th and 49th North Carolina and the 26th

and part of the 17th South Carolina regiments. It was no discredit to what was left of three regiments that they were repulsed by a force like that.

I lost in all 36 officers and 877 men; total, 913. The 23d Regiment entered the charge with 18 officers; it came out with 7. The 28th entered with 11 officers, and came out with 4. The 31st had but 2 officers for duty that night.

The First Brigade worked its way through the crater, and was halted behind the honey-comb of bomb-proofs. Here the 43d charged the intrenchments, capturing a Confederate flag and recapturing a Union stand of colors and a few prisoners. Owing to the crowded condition of the bomb-proofs, it was impossible to get the rest of the brigade on. Too much praise cannot be awarded to the bravery of officers and men; the former fearlessly led, while the latter as fearlessly followed, through a fire hot enough to cause the best troops to falter. But few of the field-officers escaped. Colonel Delevan Bates fell, shot in the face. Major Leeke stood, urging the men on, with the blood gushing from his mouth. Adjutant O'Brien fell, shot through the heart. Captain Wright of the 43d Regiment himself captured a Confederate stand of colors and 5 prisoners, and brought them in. Lieutenant-Colonel Wright with two bullet wounds retained the command of his regiment. Colonel Sigfried concludes his official report thus: "Had it not been for the almost impassable crowd of troops of the other divisions in the crater and intrenchments, Cemetery Hill would have been ours without a falter on the part of my brigade."

Nor was the giving way a willing movement on the part of the colored troops. One little band, after my second charge was repulsed, defended the intrenchments we had won from the enemy, exhibiting fighting qualities that I never saw surpassed in the war. This handful stood there without the slightest organization of company or regiment, each man for himself, and impelled by his individual instinct, until the enemy's banners waved in their very faces. Then, and not till then, they made a dash for our own lines, and that at my order. Speaking of this stand, General Burnside says in his official report: "But not all of the colored troops retired; some held the pits behind which they had advanced, severely checking the enemy until they were nearly all killed."

The engagement was over. We not only had been four times cut to pieces, but repulsed. The enemy having retaken their former lines, the troops, black and white, in the crater were

and there retaken by our troops when we entered that city on April 3d, 1865, and is now stored in the War Department.—H. C. T.

* My brigade general, which Lieutenant Fennell held when killed, was captured by Private John W. Niles, Company D, 41st Virginia, was stored in Richmond.

cut off from our army. Squads there occasionally made a dash for our lines, but as many fell as reached them safely. By direction of officers in the crater the men began a covered-way toward our lines (that is, a deep trench running somewhat diagonally between the two lines with all the dirt thrown toward the enemy's side, so that a man passing along it was almost sheltered from musketry fire). Another, by direction of General Burnside, had been started from our lines to meet it. This was the situation when the enemy made their last charge on the crater. Its inmates had repelled three charges. They were weak, exhausted, and suffering from want of water. They succumbed, and most of them fell into the hands of the enemy. Of this last scene in the battle the Confederate General Bushrod R. Johnson, commanding the opposing forces at that point, says in his official report :

"Between 11 and 12 A. M. a second unsuccessful charge having been made by Wright's brigade of Mahone's division, I proceeded to concert a combined movement on both flanks of the crater. . . A third charge a little before 2 P. M. gave us entire possession of the crater and adjacent lines. This charge on the left [our right] and rear of the crater was made by Sanders's brigade of Mahone's division, the 61st North Carolina of Hoke's division, and the 17th South Carolina of this division. . . These movements were all conducted by General Mahone, while I took the 22d and 23d South Carolina into the crater and captured 3 colors and 130 prisoners. Previous to this charge the incessant firing kept up by our troops on both flanks and in rear had caused many of the enemy to run the gauntlet of our cross-fires in front of the breach, but a large number still remained unable to advance, and perhaps afraid to retreat."

Thus ended in disaster what had at first promised to be a grand success. We were back within our old lines and badly cut up. We had inflicted a heavy, but by no means equal, loss on the enemy.

A ridiculous little incident happened directly after these terrible scenes which helped us all to forget for a moment our wretchedness. My cook, an elderly African, was a most abominable and unerring destroyer of raw material, and when called to account his usual reply was: "De meat was so tough, sah, I done parbiled a little fust, sah"; so his camp companions nicknamed him "Old Parbile." It was now noon; we had had our breakfast at 3 A. M. Being hungry, I sent several times for "Old Parbile," and finally dispatched a giant sergeant, Adam Laws, with instructions to bring "Parbile" at the point of the bayonet if necessary. In due time I heard the sergeant's mighty voice uplifted with, "Git up you dar!" and simultaneously a hearty peal of laughter rang along our dejected line. Turning, I saw poor "Parbile" writhing along on his knees in an agony of fear. In one hand he had a tin pail with my dinner, and in the other he held a palm-leaf fan to shield himself from anticipated missiles of the enemy. The sergeant was accelerating his speed with the muzzle of his gun and with a "Hurry up dar now, de cunnul will be lovin' glad to see yo'!" Nothing could have been happier in its effect on the whole command than this trifling incident, and the scanty ill-cooked meal was the better for the sauce.

Henry Goddard Thomas.

INTERIOR OF THE CONFEDERATE FORT MAHONE, KNOWN AS "FORT DAMNATION." (FROM A PHOTOGRAPH.)

SOME MEN OF THE SECOND CORPS WHO FOUGHT AT PETERSBURG.

ASSAULT AND REPULSE AT FORT STEDMAN.

TO follow the history of the siege of Petersburg in outline, one should picture the Union army creeping closer and closer to the last citadel of the Confederacy. The commander of that citadel was Lee in person, and with him was a host of veterans. As months rolled by, our line of investment grew from a short streak on the east side of the town, in June, 1864, to a vast intrenched camp with lines sixteen to twenty miles long in the spring of 1865, when the final contests took place. This remarkable attenuation of the line of the Union besiegers involved the weakening of the line at every point, for reënforcements did not come forward as rapidly as there was need of them. During the autumn and winter of 1864-5 our corps, the Ninth, now commanded by Parke, held the original position first occupied the June previous. Here the Stars and Stripes had been planted by the desperate charges, made by Hancock's Second and Burnside's Ninth corps, immediately on the arrival of the army before the town.

After the mine fiasco, July 30th, 1864, the operations of the army were confined to the single object of securing Lee's lines of communications south and south-west of the town. In August a lodgment was secured on the Weldon railroad, running into North Carolina, compelling the Confederates to use the wagon road for some miles. The right of the Union army was pushed forward on the north bank of the James, and in September General Ord took Fort Harrison, one of the outworks of Richmond. In October and November movements were made against the wagon roads between the Weldon railroad and the South Side railroad south and west of Petersburg, and the Confederate positions covering the latter railroad were attacked with some success. It was the completion of this work of cutting the South Side road that Grant was entering upon when the spring campaign was opened by the initiative of Lee.

At the time of which I shall particularly write,—March, 1865,—the eve of the forward movement ending at Appomattox, we could muster but one rank deep on the front line. The Confederates, being on interior lines, could concentrate rapidly. The reader of history has doubtless wondered, as many of us were wont to wonder at the time, why Lee made no attempt during that long siege to break out through the investing columns. Or if not Lee, then his men, for they were cooped up there and all but starving, within sight of plenty. Whenever Confederate soldiers came out from their sheltered camps on the heights and ridges to relieve pickets and guards, their eyes could follow the winding track of our military railway far away to City Point, and could the more readily mark its course by the great stacks of boxes of bread and barrels of meat, sugar, and coffee stored at points convenient to the forts that now dotted the region from the South Side around east and north to the Appomattox River. Such sights might well have created in half-famished men the desperation which goads to recklessness. But to all outward appearance there was nothing to indicate the forging of fiery bolts to be hurled upon our unsuspecting pickets and garrisons. As the mild spring-time came on, a truce was made between the outposts, and a long and bloody campaign of murderous picket-firing ceased for a season. Soldiers of either army basked in the sun, lying peacefully upon the warm sand-bags that topped out the ramparts. This cheering situation was of about ten days' duration, and the cause of it the fact that the troops that had so long been opposed to us in the trenches were at this time relieved, and a new command, John B. Gordon's corps, came to occupy the line. These men introduced the picket truce, and that truce it was that paved the way for Gordon's night sortie at Fort Stedman on the 25th of March.

The ground now occupied by the Ninth Corps had been fought for most desperately

by Lee at the opening of the investment. It was really his second line of defense as originally planned, and he had been forced away from it back to an interior line on the heights commanding the town and commanding all the railroads so important to the Confederacy. To this last ditch our Ninth Corps batteries and trenches held him. Our works were under Lee's guns, but were so strong that the poundings they got made little impression, and open assault on them was simply foolhardy. Hence we held on there while the movable left wing closed in and tightened the grip. In stratagem, however, the South had a chance, and a point so gained would open to greater things.

The First Division of the Ninth Corps, led by General O. B. Willcox, occupied trenches and forts from Cemetery Hill to the Appomattox. The fort directly facing Cemetery Hill was Morton, a bastioned work, high and impregnable. The next down the line, on lower ground and quite under the best guns Lee had on the crest, was Haskell, a small field redoubt mounting six rifled guns and holding a small infantry garrison. Eighty rods farther was Fort Stedman, a stronger work than Haskell, but not well commanded from Cemetery Hill. Two hundred rods from Stedman was Fort McGilvery, near the river and out of range of Lee's heavy ordnance. In front of Haskell, woods, marshes, and a sluggish stream completely obstructed the passage of men and guns from the enemy's works eastward, but at Stedman, where the lines were but forty rods apart, the ground of both lines and all between was solid and feasible for rapid movements of bodies of every arm of service, even to cavalry, and so here was a road that a master-stroke might open. Stedman and Haskell were garrisoned by the 14th New York Heavy Artillery with muskets, the 3d New Jersey Battery of rifled cannon, and a detachment of the 1st Connecticut Heavy Artillery with Cohorn mortars. The men of this Connecticut detachment also carried muskets. The headquarters of the 14th were at Stedman, where our leader, Major George M. Randall, U. S. A., had command. The acting major of the Second Battalion commanded at Fort Haskell. This officer was Charles H. Houghton, a volunteer of 1861, and now a veteran. Houghton had just returned from a furlough at the time of the surprise, and while at home in the North, away from the bustle of trench warfare, he had had a clear vision of things on the line. To his mind, then, it seemed an easy matter for the Confederates to make a sortie from Cemetery Hill. Accordingly, as soon as he reached the front, he increased vigilance all around, doubled the pickets and guards, and ordered the fort under arms at 4 o'clock each morning. The morning of March 25th was heavy and foggy, a good one for sound sleeping, and therefore just the time for a movement of surprise. Fort Haskell stood on a knoll overlooking the rifle-pits of the picket line. The work was guarded by two rows of abatis, and at the gap where the pickets filed out and in the outer sentinel was on duty. The man who served the last watch that morning on this outer post was Private Hough, Company M, 14th Regiment. Soon after Hough went on post at 3 o'clock, the sergeant of the

guard came out on his rounds. This officer was unaccountably nervous and kept consulting his watch, and in a short time started back to the fort to order reveille sounded. It lacked fifteen minutes of the time appointed by Houghton's special order. The sergeant's watch was fast, and he didn't know exactly how it stood, but concluded it was "better to be too early than too late." The call sounded and aroused the garrison, and it proved to be three-quarters of an hour earlier than had been customary on this line for months. When the sergeant went into the fort, Hough looked to the front and saw blue-lights flash up along the picket-pits. He also heard the sound of chopping on the lines between Stedman and the Confederate works on its front. He hallooed to the second sentinel, whose post was at the bridge across the moat, and again an alarm was called out in the fort. Hough then advanced down the picket trail toward the outposts, and as he did so some guns boomed in Stedman, and the muffled sounds of fighting were heard from that work. Some quiet strokes had been given there, for a handful of daring Confederates were in possession, and Stedman's guns were being turned on friends. The foremost of the Confederate surprisers — for bands of them were at it in earnest — had gotten through the picket and abatis guards in front of our companion fort, and all the serious mischief of the day was to come from that initial stroke. The reason of the enemy's easy surprise has never been made public. It was caused by poker and whisky. There was a game, with the usual accompaniment, going on all night in the quarters of a staff-officer of

MAJOR-GENERAL JOHN B. GORDON—NOW GOVERNOR OF GEORGIA. (FROM A PHOTOGRAPH.)

the garrison troops, and the sport was cut short in part by the play of cold steel.* Some of the men supposed to be on watch were huddled around that fascinating board, and so but one man was on the outlook along the front of the fort. The pickets were some fifteen yards distant, and they had all been silenced by stratagem. Confederates, under pretense of surrender, had approached the scattered pits simultaneously, and, after a short parley, had pounced upon their would-be benefactors and disarmed them to a man. The first point had been gained, and the blue-lights that Hough had seen from Fort Haskell were signals to announce this fact to the Confederate leaders and reserves. Now two men crawled along the ground toward Stedman, meeting the

* My authority is a commissioned officer who said he was taking part in the game.—G. L. K.

solitary sentinel at the ditch. This guard discovered the intruders when it was too late to shoot, but he put a bayonet through one assailant. The other Confederate knocked the brave guard senseless, and that opened the way to Stedman, and, in fact, to the Union lines, without a shot or serious alarm. A hundred men now passed in to the guns and went prowling about, silencing with noiseless knife or bayonet every man they could find awake or asleep.*

A strange face looked in at the poker players' hut, and the gamblers dropped their cards and cups and reached for weapons. The stranger vanished, but before those astonished men could get ready for defense more of the intruders came up, and in a straggling free fight there in the dark many of the garrison were killed or taken. The enemy now controlled Stedman, and in a few moments reversed its guns. It was this *mêlée* and the guns that were being fired on reversed range which had startled Hough as he passed from Fort Haskell toward the picket-lines. Between the fort and pickets was a long slope, and on this slope Hough met a column of men moving stealthily up to surprise Haskell. The party was in two ranks, and had filed into our lines through the gap in front of Stedman, and was moving upon us unopposed, for they were between us and our pickets. These Confederates supposed that they were approaching the rear of the little fort, and were moving very confidently, expecting an easy triumph. They should have gone through Fort Stedman itself, and then swung around to our rear, but they had miscalculated the situation. Three howitzers double-shotted with grape were trained upon the ground where they boldly marched, and if some traitor had divulged their secret movement hours in advance the doomed column could not have been at greater disadvantage than they now were by the chances of war.

* I led the burial detail after the fight, and here record what I authenticated at the time as to the manner of their death.—G. L. K.

Hough, unseen by the enemy, ran back to the fort to advise the gunners. But the sergeant's erratic watch had anticipated him and had done telling service. The garrison was ready,—doing a rehearsal, as it were, with the infantry along the parapets, the gunners at their pieces. Hough confirmed our suspicions, and we had

INTERIOR OF FORT STEDMAN. (FROM A PHOTOGRAPH.)

The fort was named after Colonel Griffin A. Stedman of the 11th Connecticut, who was mortally wounded in front of Petersburg on August 5th, 1864.

not long to wait. As the assailants neared the abatis we could hear their steps and whispers. "Wait," said Major Houghton, "wait till you see them, then fire." A breath seemed an age, for we knew nothing of the numbers before us. Finally, the Confederate leader whispered to his men, "Steady! We'll have their works. Steady, my men!" Our nerves rebelled, and like a flash the thought passed along the parapet, "Now!" Not a word was spoken, but in perfect concert the cannon belched forth grape and our muskets were discharged upon the hapless band. It was an awful surprise for the surprisers, and fifty mangled bodies lay there in the abatis, victims of a guide's blunder and the fate of battle. But this repulse did not end it; the survivors closed up and tried it again. Then they split into squads and moved on the flanks, keeping up the by-play until there were none left. Daylight now gave us perfect aim, and their game was useless. This storming-party was of picked men, and Southern authority states that not a man ever returned to the Confederate camps to tell the story which I now relate. They had risked and met annihilation.

This bloody and effectual repulse of the assailants at Haskell was a grand thing for the

cause, but proved to be a sort of a boomerang for ourselves just there in the fort. We had roused the tiger's fierceness by doing our work too well, as it were, for the capture of Fort Haskell at the outset was absolutely essential to the success of the Confederate sortie.

The Confederate plan was far-reaching, and it will be in place to quote here a letter from General Jubal Early to the writer concerning the views General Lee had of the military situation, with the Union army securely planted before Petersburg. General Early says:

"A short time before I was detached from the army confronting Grant, near Cold Harbor (1864), General Lee stated to me that it was necessary to do something to defeat Grant's army before it reached the James, for if it succeeded in so doing, the operations would become a siege, and then it would be a mere question of time as to the fate of Richmond. In the month of August, 1864, he detached a division of infantry and one of cavalry to Culpeper Court House under General R. H. Anderson, and he informed me that his object was to induce Grant to detach troops from his army, and (if he succeeded) in that he would make further detachments, with the view of causing the siege of Richmond and Petersburg to be raised in the same manner that Richmond had been relieved of the threatening position of McClellan's army in August, 1862."

This programme had been adhered to by the Confederates, without, however, loosening the Union hold on the Appomattox and James.

"About the 15th of March, 1865 [General Early continues], I went out to General Lee's headquarters near Petersburg, and he then informed me that unless the progress of Sherman's army in North Carolina could be arrested he [Lee] would be compelled to withdraw from the defenses of Richmond and Petersburg in the direction of Danville, and he desired that with the remnant of my command I should hold south-western Virginia on his left, so as to protect the lead-mines and salt-works in that region. I presume, therefore, that had Sherman's progress could not be arrested, the assault of March 25th was a desperate effort to break Grant's lines. General Lee's entire force at that time was very little over 30,000, as I was informed."

Topographical considerations made the ground at Fort Stedman the point best suited for Lee's initial stroke. But beyond Stedman toward the railway and the bluffs, where the heavy Union guns were planted, was low ground and plains. Now, if Stedman and all the works north of it to the river were cut away by the enemy, so long as Fort Haskell remained intact it projected our line into the center of the vast open space which must necessarily become the main field of action. This work then would be close on the flank of Confederate columns while passing through the breach at Stedman, and for some distance in their movements against our interior lines, and this position would enable her guns to sweep the invaders with grape and case for a long interval before their great objective on the rear bluffs should be reached. The stunning blow given to the great movement by

the men of Haskell occurred just as a division of Confederates which had filed into the works at Stedman had started on a rapid conquest along the trenches toward Fort McGilvery. We could see from Haskell the flashing of rifles as these men moved on and on through the camps of the parapet guards. Another division, encouraged by the success of the first, started also from Stedman along the breastworks linking our two forts. This division aimed to take Haskell in the right rear. At the very outset, this last movement met with momentary check, for it fell upon two concealed batteries and two Massachusetts regiments now under arms. Meanwhile there was a lull around Haskell; but it was of short duration, for it was so light that the enemy could observe from his main line every point on the scene of conflict. He opened on Haskell with Stedman's guns, and also with his own in front. Our little garrison divided, one half guarding the front parapet, the remainder rallying along the right wall to meet the onslaught threatened by the division coming against it from Stedman. At this juncture, Major Woerner, a veteran German artillerist and commander of the 3d New Jersey Battery, came into the fort and took charge of the artillery. He placed one piece in the right rear angle, where the embrasure admitted the working of it with an oblique as well as a direct range. The venturesome Confederate column had borne down all opposition, and with closed-up ranks came bounding along. At a point thirty rods from us the ground was cut by a ravine, and from there it rose in a gentle grade up to the fort. Woerner's one angle gun and about 50 muskets were all we could summon to repel this column, and there were probably an even 60 cannon and 1000 muskets at Stedman and on the main Confederate line concentrating their fire upon Haskell to cover this charge.* The advancing troops reserved their fire. Our thin line mounted the banquettes,—the wounded and sick men loading the muskets, while those with sound arms stood to the parapets and blazed away. The foremost assailants recoiled and scattered. This success again stirred up the tiger. The Confederate forts opposite to us gave us a response more fierce than ever, and a body of sharpshooters posted within easy range sent us showers of minies. The air was full of shells, and on glancing up one saw, as it were, a flock of blackbirds with blazing tails beating about in a gale. At first the shells did not explode. Their fuses were too long, so they fell intact, and the fires went out. Sometimes they

* In an artillery duel shortly before this we counted twenty-four mortar bombs in the air at once with pathway directly over the fort.—G. L. K.

rolled about like foot-balls, or bounded along the parapet and landed in the watery ditch. But when at last the Confederate gunners got the range, their shots became murderous. We held the battalion flag in the center of the right parapet, and a shell aimed there exploded on the mark. A sergeant of the color company was hoisted bodily into the air by the concussion. Strange to say, he was unharmed, but two of his fellow-sergeants were killed, and the commandant, Houghton, who stood near the flag, was prostrated with a shattered thigh. This was all the work of one shell. Before the wounded major could be removed, a second shell wounded him in the head and in the hand,—three blows in as many minutes.

The charging column was now well up the slope, and Major Woerner aided our muskets by some well-directed case-shot. Each check on this column by our effective firing was a

pole had been shot away, and the post colors were down. To make matters still worse, one of our own batteries, a long-range siege-work away back on the bluff near the railroad, began to toss shell into the fort. We were isolated, as

FORT HASKELL FROM GRACIES SALIENT.

FORT STEDMAN FROM COLQUITT'S SALIENT.

(FROM RECENT SKETCHES.)

spur for the Confederates at a distance to increase the fury of their fire. They poured in solid shot and case, and had twelve Cohorn mortar batteries sending bombs, and of these Haskell received its full complement. Lieutenant Tuerk, of Woerner's battery, had an arm torn off by a shell while he was sighting that angle gun. Major Woerner relieved him, and mounted the gun-carriage, glass in hand, to fix a more destructive range. He then left the piece with a corporal, the highest subordinate fit for duty, with instructions to continue working it on the elevation just set, while he himself went to prepare another gun for closer quarters. The corporal leaped upon the gun-staging and was brained by a bullet before he could fire a shot. The Confederate column was preceded, as usual, by sharpshooters, and these, using the blockhouses of the cantonments along the trenches for shelter, succeeded in getting their bullets plumb into the fort, and also in gaining command of our rear sally-port. We took up the planks from the bridge stringers over the moat and began to think of our bayonets. All of our outside supports had been driven off, and not a friendly musket, sword, or cannon was within a quarter of a mile or more of us, and we were practically surrounded. The flag-

all could see; our flag was from time to time, by shot and casualties as I have related, depressed below the ramparts, or if floating was enveloped in smoke; we were reserving our little stock of ammunition for the last emergency, the hand-to-hand struggle which seemed inevitable. The rear batteries interpreted the situation with us as a sign that Haskell had yielded or was about to.*

Our leader, Houghton, was permanently disabled, but Randall, the commander of the regiment, had escaped from his captors in Fort Stedman before daylight, and had worked his way along a blind trench to Haskell. He joined us shortly after Houghton fell. He had our regimental colors wrapped around him under a private's jacket. Randall now called for a volunteer guard to sally forth and make a demonstration to show our friends outside that the old flag was still there. Fort Haskell's color-bearer, Kiley, and eight men responded to the call. Randall led the way across a bridge stringer, and the flag was flaunted in the eyes of the astounded Confederates who hung about the rear of the fort. Better than all, the standard

*A message to this effect was taken to one of the distant siege batteries, with the request to fire upon us. The commandant refused.—G. L. K.

waved conspicuously in view of our second line. Four of the guard were hit, one mortally, but the fire in the rear ceased.

The assaulting column from Stedman now broke under the fire of our muskets and Woerner's well aimed guns. But the men found some shelter behind the infantry parapets along which they moved, and also in the deep trenches and among the breastwork huts, while the boldest came within speaking distance and hailed us to surrender. The main body hung back beyond canister range, near the ravine at the base of the slope. Our bullets could reach there. Major Woerner at last held his fire, having all the pieces loaded with grape. Suddenly a great number of little parties or squads of three to six men each, arose with a yell from their hidings down along those connecting parapets, and dashed toward us. The parapets joined on to the fort, and on these the Confederates leaped, intending thus to scale our walls. But Woerner had anticipated this. The rear angle embrasure had been contrived for the emergency. The major let go his grape. Some of the squads were cut down, while others ran off to cover, and not a few passed on beyond our right wall to the rear of the work and out of reach of the guns. With this the aggressive spirit of that famous movement melted away forever. The sortie was a failure, and daylight found the invaders stalled in the breach. They could not advance; death or capture awaited them where they lay; and in order to return to their own lines they must run the gauntlet of guns which had cross and enfilading range over the only way of retreat.

The combat now changed, but was none the less exciting in the new phase than it had been thus far. The roar of cannon had waxed louder and louder as the gunners on each side sighted the true situation. As the infantry movements ceased, the artillery duel became terrific. It was the ground for such engagements, and had witnessed hundreds, but never on such a scale as this. The whole space of rolling surface between our front line and the second on the bluff near the railroad, was dominated by the enemy's guns on his main line. When the Confederate infantry columns disappeared from around Haskell, all those guns opened upon this field where the morning's manœuvres had been made. Our guns back on the bluff, and at Fort Morton, the work next south of Haskell, took part, and swelled the cannonade to a deafening warfare of Titans. The air was full of flying balls and shells clashing and bursting far above us and raining fragments. The Confederates opened with all their available pieces on little Haskell, and it now became impossible for us to move safely within the fort. Every man must have been ground

to earth had we been forced away from the sheltering walls and parallels. The *terre-plein*, or open surface, offered no shelter whatever, for mortar bombs came upon us almost perpendicularly. Tents, timbers, gun-carriages were flattened to earth. The exterior surfaces of the fort fared no better. The heaviest guns pounded away to reduce it by battering, and their projectiles plowed the embankments, tossing the logs and sand-bags as though they were feathers. The Confederate problem of the day was reduced to the silencing of Haskell, and it was the target of more guns than had been concentrated upon one point during the siege. Here, for once, after all the prosy months of stupid carnage, was a realization of the grand and the terrible in war.

It was now no longer a question of forging ahead for Gordon, the dashing leader of the sortie,—but of getting back out of the net into which he had plunged in the darkness. A cordon of fortified batteries commanded all the ground whereon his ranks were spread, and our artillery reserves stationed between the main batteries created an unbroken chain of cannon barring him from the railway. Supporting these guns was a solid line of infantry just gathered hastily from the left, and covering every avenue of advance. The way of retreat was back over the ridge before Stedman. This was swept by two withering fires, for Fort Haskell commanded the southern slope of the ridge and McGilvery the northern. With either slope uncovered the retreat would be comparatively easy and safe for Gordon, and the Haskell battery was the one at once able to effect the severest injury to his retreating ranks, and apparently the easiest to silence. The rifle and mortar batteries and sharpshooters in our front took for a target the right forward angle of Haskell, the only point from which Woerner could reach that coveted slope. A murderous fire was poured into this angle, and the Confederate troops in Stedman began to scramble back to their own lines. Woerner removed his ammunition to the magazine out of reach of the bombs that were dropping all about the gun. His men cut time-fuses below and brought up the shell as needed. The brave major mounted the breastworks with his glass and signaled to the gunner for every discharge, and he made that slope between Stedman and the Confederate salient (Colquitt's) a pen of fearful slaughter. The whole mind sickens at the memory of it, for the victims were not fighting, but were struggling between death and home. Suddenly an officer on a white horse rode out under the range of Woerner's gun and attempted to rally the panic-stricken mass. He soon wheeled about, followed by some three hundred men. He drew them back

out of range, halted, and formed for a charge to silence that fatal gun. The movement was distinctly observed by us in Haskell, and Woerner continued to pound away at the slope, while the infantry once more formed on the parapets. The storming-party moved direct on our center, as if determined now to avoid contact with the guns of either angle. But our muskets were well aimed, and the new ranks were thinned out with every volley. The party crossed the ravine, and there the leader fell, shot through the head. Many of his men fell near him, and the last spasm of the Confederate assault was ended. Gradually the fire on both sides slackened, and the Confederates who were still within our lines laid down their arms. The battle had lasted four hours, and about 8 o'clock the Union reserves under Hartranft advanced and reoccupied the lines.*

Randall, the commander ousted from Stedman, and a band of his followers had left our fort some time before the counter-assault, and they went into their old quarters at the head of the advancing reserves. Randall claimed and secured the right of reoccupancy with his own men. Outside spectators of this fight wondered that any man in Haskell survived. Major Houghton was borne away at once on a stretcher, and as he passed the various headquarters was greeted with cheers and congratulations. The garrison of the work was sparse, about one hundred and fifty men. They had all been on duty around the sheltered guns and the parapets, spots purposely protected and the safest in the fort. But, as it was, Major Woerner says he slipped many times that morning in the blood that covered his gun-staging.

The story of resistance to Gordon's surprise, aside from that already told, is brief. The men in Haskell alone stood up to their posts, and held on from beginning to end, remaining in orderly action under their officers' commands. The surprise was complete at all points between Haskell and McGilvery, and the whole brigade was thrown back under much demoralization. General N. B. McLaughlen, the com-

mander, was captured near Stedman while trying to rally the scattering troops. At McGilvery the Confederates made one attempt, but the admirable work of Major Roemer's artillery repulsed them effectually. In the trenches and smaller outworks near Fort Stedman the struggle was short and one-sided, and before daylight the Confederates had gained all the ground they held during the morning. The impression made upon our men elsewhere than at Haskell was that the enemy counted on a complete surprise all around, but when they saw how it failed at one point they became disheartened, and would not advance until that one point yielded. Three times the leaders put their men boldly upon Haskell, and the other columns watched the result. Conspicuous failure here disheartened the bravest, and their fighting valor waned before they abandoned the captured lines. The contest was really so much harder than had been expected that only a determined few came to the point of facing our guns at close quarters.

This account of the left flank at Stedman covers all that was *done in defense* of our line that morning excepting what was accomplished by artillery from our rear batteries at long range. All else was straggling and ineffectual. Had this battle occurred at another time than at the wind-up of the war it would have a larger space in history. The men of three army corps could see this fight. An old schoolmate, who was on the outside where he could look down upon us, greets me when we meet with the salutation, "There is a man who went through hell alive!" Fort Haskell was the size of an ocean steamer's deck, and one may imagine that scores of cannon and hundreds of rifles playing upon such a space for hours would make it a hot spot. During the engagement, I was stationed in four different positions in the work, and saw every phase of the conflict. As soon as it ended, I went with reënforcements to Stedman, and got notes on the course of events there, both from Confederate prisoners and from my own comrades.†

George L. Kilmer.

* General Gordon, during an interview had with him by the writer, in 1878, stated that his purposes in making this assault had been "to roll up the Union line" from left to right, beginning with Fort Haskell, and as soon as he saw that Haskell could not be silenced he determined to withdraw. He did not do this immediately because he required Lee's sanction. The Union counter-assault, as it had been called, did not expel him nor hasten his movement, but simply de-

stroyed and captured such of his command as had not retreated. Henry W. Grady, an intimate friend and companion of the general, who was present at this interview, subsequently stated that General Gordon always gave this version of the fight and desired it to stand so in history.

† The entire loss of the Union army in the operations of March 25th is estimated at about 2200, and that of the Confederate army at nearly 4000.—EDITOR.

TOPICS OF THE TIME.

The First Century of the Constitution.

THE month of September, 1887, naturally suggests the completion of the work of the Convention of 1787, just a hundred years ago, in its successful formation of the Constitution of the United States. The difficulties which attended the Convention's work are detailed elsewhere in this number of THE CENTURY by a distinguished historian, and a discussion of an important feature of it occurs in two Open Letters, one by a lawyer of Indiana, and the other by one of our leading historical students. It may be well for us, with the light of a century's practical experience of the Constitution, at the end of which that instrument fits the new nation as comfortably as in 1789, to consider what the difficulties of the Convention would have been if it had been called upon to frame, with prophetic vision, a Constitution for the United States of 1887.

The strongest argument which the "Federalist," and the defenders of the new Constitution in the State conventions, could advance in favor of ratification and in justification of the expectation of the practical success of the Constitution, was the comparatively small size of the country. Hamilton, in the "Federalist," lays down this rule: "The natural limit of a republic is that distance from the center which will barely allow the representatives of the people to meet as often as may be necessary for the administration of public affairs." He estimates the length of the country, from north to south, at 868 $\frac{3}{4}$ miles, and its breadth at 750, adding this comfortable comparison: "It is not a great deal larger than Germany . . . or than Poland before the late dismemberment." In another place he says: "If there be but one government pervading all the States, there will be, as to the principal part of our commerce, but one side to guard,—the Atlantic coast." With what feelings would he and the Convention have set about their work, if they could have realized that they were in reality framing a scheme of government for a country which was to stretch from north latitude 25° to 49°, and from the 67th to the 125th degree of west longitude, 2600 miles by 1600 through the center, to say nothing of Alaska, in itself two-thirds the size of the country of which Hamilton was speaking? That the commerce for which they were caring was to whiten the waters of both the Pacific and the Atlantic, of the Gulf of Mexico as well as of the Great Lakes? That the Congress which they were providing was to deal with an *internal* commerce greater than all the *foreign* commerce that the country has ever known; with a manufacturing capital of \$2,800,000,000 and an annual product of \$5,400,000,000; with a population of 60,000,000, instead of 4,000,000? That the time would come when a member of Congress would be compelled to travel 6500 miles in going to the Federal Capital and returning to his State? It is a fortunate thing for the United States that the Convention which framed its Constitution knew nothing of the future, and devoted its care and energies to the establishment of a government for the country which it knew.

The Convention sent forth the instrument which it had framed to meet the future, and the most marvelous feature of its first century of trial has been its apparently inexhaustible power of accommodating itself to the growth and changing necessities of the people. Its judiciary system has expanded in its territorial jurisdiction from thirteen districts to sixty; its Presidential office has had control of a million of armed men; its imports have risen from \$22,000,000 to \$640,000,000, and its exports from \$20,000,000 to \$720,000,000; steam, electricity, and all the other forces which modern civilization has harnessed for the service of man, have altered the life and needs of the people; and still the national government established by the Constitution remains unchanged in substance. The natural divergence of its lines has brought larger and still larger fields within their scope; the few employees of 1789 have increased in number until they are an army; but the Treasury officer of 1789, if he could examine the organization of to-day, would still be able to trace clearly the lines of the original formation, though he might be bewildered in the effort to follow out all the ramifications by which the system has met the requirements of later development. The case is the same in every department of the national system: it has developed, but it has not changed. The Convention of 1787 could hardly have provided a more satisfactory system for 1887 if, with prophetic vision, it had been able to forecast the needs of 1887 and adapt its work to those needs.

Nations, like individuals, can live but one day at a time, and their business is to live that day as wisely, honestly, and justly as may be; not to essay the part of a Providence, and attempt to legislate for millions yet unborn. They cannot legislate for posterity: they can only provide the molds into which following generations must be poured; and, unless those molds are wise, just, and honest for the generation which makes them, they will assuredly be broken by some succeeding generation, or they will compress and mar the whole life of the people. In this sense, we, who stand on the threshold of the second century of the Constitution, are as actually constitution-makers as the members of the Convention of 1787. Let it be our care to make our institutions wise, just, and honest for the people of 1887, and to hate and repudiate every proposition that savors of dishonesty or of injustice, however it may seem to our temporary advantage, knowing that we are thus doing all that man can do for the people of 1987.

A Great Teacher.

THE teachers of men are many; the teachers of young men are few. To turn the faculties of a mature mind to the education of youth is something willingly undertaken by many, but success does not depend upon willingness or knowledge, or even enthusiasm. The art of teaching is a gift and an inspiration equally

with poetry and music. In the vast majority of even good teachers, it is impossible to resist the conclusion that they become accommodated in their own minds to the minds of their pupils. Sympathy being the essential requisite, they unconsciously fall into the habit and scope of thought of their students,—“subdued to what it works in, like the dyer’s hand.” It is the fatal tendency in teaching to shrink towards the capacity of those taught—a tendency that able teachers resist by constant watchfulness and severe studies.

When a great man gives himself to teaching young men, and successfully resists this tendency, and when also he has the gift or genius for teaching, we have that rarest of men—a great teacher. This century has furnished two eminent examples: Dr. Arnold, of Rugby, and Dr. Hopkins, of Williams College. There have been other great teachers, but these two men pre-eminently wear these marks,—greatness and genius in their work. Dr. Arnold taught boys, but he kept even with his own powers, and was as great as if he had spent his days at Oxford or in Parliament. Dr. Hopkins taught young men, but it is difficult to conceive of him as greater in any other possible sphere. The success of each is due to the fact that they preserved the full measure of their mental powers, and at the same time had the faculty of laying powerful hold of the young mind. A great mind, enlisting young men, and drawing them by the secret charm and power of his divine gift up to himself without descending in his own mental habit to them,—such was Dr. Hopkins.

It would not be quite correct to say that Dr. Hopkins had a theory of teaching. Great men do not work by theories. He taught spontaneously, out of his own nature; and here lay the value of his work. He carried into the class-room the free action of his own mind and also its total action. Many men are able to do this who fail as teachers, but Dr. Hopkins possessed the knack of bridging the space between his own lofty thought and the mind of the pupil, and so getting him up to his own level. This is true teaching—inducing in the pupil the thought and feeling of the teacher.

But Dr. Hopkins did far more to get his pupils to share in his thought and ideas: he taught them to think in the same fashion. It was not a prime or even a subordinate purpose with him to induce his pupils to agree with his opinions. He rather aimed to get them to thinking in a certain way. His idea was that if he could arouse the nature of the man to the full, and start him into vigorous natural action, he would think safely. Hence he taught principles, and, above all, the nature of man. Scholasticism, formal logic, dogma—these were remote from his methods, as they were remote from himself. “Know thyself” is the heathen phrase which he put to a use that carried his pupils to the heights of Christian morality. It is for this reason that his teaching and his pupils wear the plain marks of freedom and catholicity.

It was also a distinguishing mark of Dr. Hopkins’s instruction that it had a peculiarly germinant quality. Teaching by principles and by the nature of man, and avoiding a too close deduction, his pupils were left free to develop in their own way. Dr. Hopkins taught the catechism for many years, but the students carried away more of their teacher’s breadth and rationality than of the dogmas of the Confession.

It was a characteristic of his teaching that it had a directing rather than a binding influence. Room was left in it for growth, for variation, and adaptation to new conditions. He founded no school of philosophy, but did the better work of grounding young men in the fundamental principles of thought and feeling and conduct. If his teaching had a specialty, it consisted in unifying truth; the truth of one realm was the truth of all realms. Thus a well-taught pupil stood with the whole earth under his feet and all heaven above his head.

Dr. Hopkins’s long life was spent in one of the most rural parts of New England, and one of the most remote from the centers of culture. Shut in between the Hoosac range on the east, and the Taconic on the west, miles of untouched forest on every side, in a little village that clustered about the college as cottages nestled at the foot of a friendly castle, he drew to himself, like a medieval teacher, pupils from all parts of the country, kept them about him for four years, and sent them out, stamped with his impress, to the towns and cities to repeat in themselves what he had taught them, and to convey far and wide something of the keenness of thought, of moral earnestness, and religious wisdom which they had learned and felt in him. Such a life is at once great in its humility and in the breadth and power of its influence.

Shall we Plant Native or Foreign Trees?

THE relative value for planting in America of native and foreign trees is a question of wide and deep and of rapidly increasing interest; yet it is one to which the public has scarcely begun to give the attention it deserves. As the destruction of our native forests progresses, planting for the sake of timber must be ever more largely engaged in; and this destruction cannot but progress with considerable rapidity, even though the legislation which is so greatly to be desired as a check upon it should soon be brought to bear. Year by year, too, it becomes more desirable that the worn-out fields of our Eastern States should be put to arboricultural service, and that the settlers on the prairies of the West should be accurately informed as to what trees they may best set out. And as our love for art increases we shall wish to do even more than we are doing now in the way of private and public planting for ornamental purposes. In short, there is no American who is not interested, directly or indirectly, in the question as to the kinds of trees which are best adapted to American uses.

The extent to which we have hitherto planted foreign trees is probably ignored by a great majority of our readers. Not indeed in very earliest years, but ever since the first advent among us of the nursery-gardener we have given them the preference, in our more thickly settled districts, over trees of native origin. The first nurserymen were Europeans, and brought both their stock of knowledge and their stock of plants from the Old World; and even when their knowledge had extended itself their stock remained largely the same; for, from some inexplicable reason, a great many species of European trees may be far more easily raised, and therefore more cheaply and profitably sold, than our own. Thus the private planter, getting his materials from nursery gardens, has generally been led to

choose foreign trees. Again, those who first began to plant on a large scale with an eye to economic results—to the production of timber—were inspired by English examples, and naturally selected those species whose utility had been proved by centuries of experience. So when ornamental planting over large areas was undertaken, what more natural than that the landscape-gardener should most often try to reproduce European successes and guide himself by the recommendations of those European books which were his only printed helpers?

The result has been that the foreign representatives of many important genera are as familiar to American eyes in populous districts as their native cousins, and in certain cases—in the case, for instance, of the willow, of the spruce, and of the horse chestnut—are much more familiar. Signs of a change in practice may now be perceived. A few years ago it was impossible to buy American trees in any quantity in any nursery, but now they may more easily be had and are more often chosen. Still, the comparatively recent introduction of novel species from Asia has added to the exotic temptations of the purchaser, and even now, we are told, "where one native tree is planted in Massachusetts, five foreign trees are planted here."*

It will easily be guessed that this is not a desirable state of things. But how deplorable a state of things it really is, few understand as yet, save those who have specially studied the behavior of foreign trees upon American soil. Such study has been carefully carried on by more than one scientific observer during a number of years, and of late an effort has been made to test the value here, as sources of timber supply, of many of the species which had made the best records in their native habitat. Of course all observers do not agree upon all points, and of course it is too soon yet to decide dogmatically with regard to many imported species. But with regard to many others the evidence is practically conclusive and of a most unfavorable sort.

Take, for instance, the Norway spruce (*Abies excelsa*), which all through the Northern and Eastern States has been planted in such numbers for so many years that it can surely be said to have been fairly tested. It is a most remunerative tree to nurserymen, and a most tempting one to planters—easily raised and transplanted, and growing with remarkable rapidity and great beauty of form while young. But in the pamphlet just quoted, Professor Sargent says that its general introduction into our plantations "must, nevertheless, be regarded as a public misfortune. . . . In spite of its early promise, it must be acknowledged to be a complete failure in eastern America. It has passed its prime here, and is almost decrepit before it is half a century old; it will never produce timber here, and it becomes unsightly just at that period of life when trees should be really handsome in full and free development." The most cursory glance at the condition of this tree in the neighborhood of New York will prove that it is not unsuited to the climate of Massachusetts only. The Central Park is disfigured by hundreds of half-dead specimens which are not yet

half grown; and even where the soil is better, ragged, blackened forms almost invariably prove a want of health and vigor. Again, Mr. Robert Douglas, of Waukegan, Ill., one of the oldest and most widely known nurserymen in the country, writes† that he has never seen a Norway spruce in the East fifty years old that was not failing in its upward development, or one in the West forty years old; and that when he went purposely to Canada to examine a large number which he had seen planted forty-nine years before (believing that they might have done especially well in a northern climate), he found that not one was living, and that many which had been planted in later years were already failing. And he adds, that he speaks with a sense of responsibility, as he has "grown more Norway spruces than any man in America and than all other men in America."

As it is with this favorite conifer, so it seems to be with many others almost as often planted. The Scotch pine (*Pinus sylvestris*), for example, will bear more exposure than any other tree, and will sooner make an effective "wind-break." It is therefore invaluable in certain positions to planters on the prairies; but as regards long life and the production of timber, Mr. Douglas pronounces it "an abject failure" in any part of the country where he has ever seen it, and his words are fully confirmed by the Massachusetts report.

With deciduous trees the case is similar. Neither the foreign lindens nor the foreign ashes are long-lived in this country. The sycamore maple (*Acer pseudo-platanus*)—so widely cultivated abroad for its valuable timber—grows rapidly at first, as is the way with many other European trees, but seems likely to prove quite worthless at least for economic purposes. Of the European oak (*Quercus robur*) Professor Sargent writes: "Tens of thousands of these trees have been planted in this State during the last century, but it is now almost impossible to find anywhere a healthy specimen more than thirty years old, while all the older trees have now almost entirely disappeared from the neighborhood."

These few instances are examples of a number more which might be given of the proved unfitness of European trees to withstand our climate. With other species, as has been said, the question still remains an open one; and with others, again, the evidence seems distinctly favorable. The white willow of Europe (*Salix alba*) not only flourishes, but has become thoroughly naturalized, in New England, and is of greater economic value than any native species. Though as much as this cannot be said of any other European tree, the English elm (*Ulmus campestris*) does thoroughly well and affords by its very different habit a desirable contrast to our native elms, while the Norway maple (*Acer platanoides*) and the European larch (*Larix europæa*) also promise to thrive. In such cases the needs of the landscape-gardener justify their continued cultivation, even though related native species may be still better fitted to supply us with timber.

As the climate of eastern Asia is much more like our own than that of Europe, one is not surprised to find the trees which have been brought thence giving, as a whole, a better account of themselves. Their chief value is for ornament and shade, but from these points

*"Some Additional Notes upon Trees and Transplanting in Massachusetts," by C. S. Sargent, director of the Arnold Arboretum, of Harvard College. (Extracted from the Annual Report of the Massachusetts State Board of Agriculture.) Boston: Wright and Potter, 1886.

†In one of a number of letters recently published in the "Philadelphia Press."

of view some of them are very precious acquisitions. The curious ginkgo-tree, which has a beauty all its own, is now largely planted in the streets of Washington and is perfectly hardy as far north as Massachusetts. The paulownia, so interesting in form, so valuable for shade, and so splendid in its spring bloom, thrives in all the cities of the Middle States; and its masses of purple flowers appearing every now and then in the wild woods of Maryland show that there at least it has made itself perfectly at home. Of the ailantus it is hardly necessary to speak. Despite the disagreeable odor of its blossoms, it is one of the most valuable of all trees for city planting—growing very rapidly, affording a wide expanse of shade, being free from insects, and keeping the freshness of its foliage uninjured through the heats and dusts of summer.

But it is not our present aim to weigh the evidence for and against this tree or that. What we desire is simply to show that such evidence has already been collected in a considerable body; that it is the duty of every experienced planter still further to inform the public; and that it is for the interest of every intend-

ing planter that he should consider carefully before he buys his stock. Yet we feel justified in adding to these general statements a word of strong recommendation in favor of native as against foreign, or at least as against European, trees. At the best the latter are uncertain in almost every case, while the former have an inborn and a well-proved title to be trusted. The most successful ornamental planting that has ever been done in America shows its results in the streets of such towns as Stockbridge, Great Barrington, Salem, and New Haven, and was the work of men who went to the forest and not to the nursery for their infant elms and maples. Certainly our more recently planted parks offer small promise of a like maturity of beauty, with their European oaks and ashes, their Scotch and Austrian pines, in almost as deplorable a state as their Norway spruces. When not ornamental but economic plantations are in question, past experience tells very strongly against European trees, while the evidence of recent experiment with native trees—as in the plantations of indigenous conifers in eastern Massachusetts—is of the most encouraging kind.

OPEN LETTERS.

Centennial Considerations.

Two Views of the Relation between the State and the General Government.

I. GOVERNMENT BY THE PEOPLE.

IF a small community can govern itself, and do it better than others can govern it, a larger community composed of like individuals can do the same, and so any still larger community of like individuals, even to the largest.

There is no reason why a government by the people, through their representatives, should not wisely and well govern the inhabitants of a whole continent, provided the people are sufficiently civilized to enable those occupying the various parts of it to govern themselves.

This will appear more clearly the more accurately we distinguish what are the proper functions of government, and all that is necessary for it to do.

The only warrant for the existence of government of any kind is, that it makes possible for the people a greater degree of happiness than would be possible without it. In the earlier stages of civilization, war is the chief business of the government, and success in war is the chief good, and to it all else is made subservient. When civilization has advanced somewhat, it is found that in some degree each individual should be protected from aggression by other individuals, and then the power of government is, to some extent, exerted for that purpose; and as civilization progresses, this purpose increases in importance as compared with the other, and could we imagine wars entirely to cease, it would be the only necessary function of government.

From our position in relation to other nations, and from our strength as compared with those on this continent, the danger from aggressions by other nations is exceedingly small, and the probability of any resort to arms, unless we are the aggressors, is very remote, so that the preventing of aggressions by other nations

has come to be with us of comparatively small importance. Our government should every year become less military and more industrial; that is, less occupied with the duty of preventing foreign aggressions, and more occupied with preventing the aggressions of individuals on each other, and promptly and sufficiently repressing the wrongs done by such aggressions.

This, the paramount duty of government, has been very imperfectly performed in the past, and there is little reason to hope that it will be better done in the near future. Much of this imperfection is due to the low standard of the average morality of the people. But is not more of this imperfection the result of our governmental machinery not being adapted to the performance of this duty? Can it be performed efficiently so long as the national and State governments coëxist, and each is expected to perform undefined and undefinable parts of this duty?

When our national government was formed, slavery existed in most of the States, and presented an insuperable objection to any arrangement by which the people of the whole country could be intrusted with unlimited power over any part of it. The part of the people among whom slavery existed, and who intended to retain it, would not, and could not, consent that the part among whom it did not exist should regulate the relations between master and slave. Where these relations existed, laws were required which would not have been tolerated elsewhere, and it was only by the agency of the State governments that slavery could be continued.

For the repression of crime and for dealing with the criminal class, the single agency of the nation would be more efficient than the one compounded of the nation and the several States, each acting separately. There are as many criminal codes defining crimes and the mode of dealing with them, and with the criminal class, as there are States, and to them is added the code of the nation.

Whatever is properly a criminal act in one locality

should be so in every place in the nation, and the criminal laws with the mode of enforcing them which would be the best possible in any subdivision would be the best in every subdivision. How to prevent the ingress of paupers from abroad, and how to deal with those here, would be problems more easily solved through the single than through the complex agency.

There are many matters which in the near future will need regulation. Among these may be mentioned the relation of employers and employees; gambling in stocks, grain, etc.; the extent to which accumulations of wealth in the hands of individuals or corporations shall be permitted; what restraints shall be imposed on monopolies of every kind; whether there should be a limit, and what one, upon the right to acquire and hold lands. With these and like questions the State governments are incompetent to deal, for if one State legislated effectually as to any such matters, its only effect would be to drive from its territory those who regarded themselves as injuriously affected by such action, and they would seek a State where there had been no such legislation.

As to matters with which each of the civil codes of the States deal. Why should there be different land tenures, why different rules of descent and distribution of decedents' estates, different laws as to wills, as to marriage and divorce, as to parent and child, as to guardian and ward, as to contracts, as to corporations, etc., etc.? Why should there be as many different modes of administering justice? Why should that be held to be just in the courts of a State which is held unjust in the courts of the nation, or in the courts of other States? why a right enforced, if claimed against a citizen of the same State as the claimant, and denied as against a citizen of another State?

If there was but one code of laws and one judiciary, that of the nation, justice would be the same in every locality, and the rights and duties of the individual and all aggregates of individuals would be alike everywhere within the national limits. Is there any reason why this should not be?

The tendency has been in the direction of the exercise of larger powers by the nation and restrictions on the power of the States. Except as to a few matters, this has not been the result of changes in written constitutions, or conscious action on the part of the people. The nation, through its courts, from time to time, has asserted jurisdiction not given by the Constitution, as understood at and soon after its adoption. As instances may be mentioned the rulings of the Supreme Court of the United States in 1806, that the courts of the nation had no jurisdiction of a controversy between a citizen of one State and a corporation of another State, if any of the stockholders of the corporation were not citizens of the last State. This ruling was repeatedly followed; but in 1844 the court overruled all these cases, and asserted the jurisdiction over all such con-

troversies, without reference to the citizenship of the stockholders. It is under this later ruling that the courts have assumed jurisdiction over all matters in which the railroad, telegraph, and other great corporations are interested. The same court, in 1825, ruled that courts of the nation had no jurisdiction over any navigable waters except where the tide ebbed and flowed, and repeatedly so decided until 1851, when it asserted jurisdiction over the great lakes, and in 1857 extended it over all navigable rivers. Now Congress has but to declare any locality navigable water, and legislate in regard to it, and the courts of the nation hold that Congress has not exceeded its powers.

Congress has assumed a supervision of elections, it has declared certain promises to pay to be money and a legal tender, and the courts of the nation affirm its power. It is unnecessary to multiply instances. As to no matter has the nation exercised a doubtful or prohibited power, but in a short time such power has been recognized as belonging to it, and a new reading given to the Constitution as the proper warrant for it.*

The small powers still exercised by the States over railroads and telegraph lines will probably soon be taken from them and absolute control of them be assumed by the nation, and this with the approval of the people. For they feel that it is almost intolerable that the rights of these great corporations should change with the passage from State to State; and this feeling will grow until it finds expression in legislation by the nation, and its assumption of entire control.

The nation has assumed the power to make regulations for the preservation of the health of the people, and for the extirpation and prevention of cattle-plagues, etc., and there is no limit to the powers it will exercise for such purposes whenever it is deemed proper by the people.

Public education is likely soon to be declared a matter of national concern, and if the people so wish, the nation will take charge of it and exclude the States. This will probably be, in the future, the history of every matter which equally interests and affects the whole people.

Why should it not be so? Why should not all law-making be done by the nation? Why should not all general laws operate alike everywhere within the nation, making the rights and duties of each individual, and of all aggregates of individuals, the same in all places?

It may be asked, How can the nation deal with the matters which are of interest only in particular localities? The answer is that, under proper general regulations and restraints, all such matters should be placed within the control of minor subdivisions. Each county, each city, or other subdivision, should be given full power over whatever affects only the people of the subdivisions. If the State governments should cease to exist, the only class which would suffer would be the office-holders. Almost, if not quite, half of the great army of office-holders could be disbanded, and a

* Without any desire to inject counter-arguments into the article, an example may be taken to the very essential portion of it. First the nature of the exercise of doubtful or prohibited powers is here asserted, but at least three of them are quite irrelevant. The Attorney-General's opinion is "Judge only law"; the Constitution merely gives Federal courts "Admiralty jurisdiction," leaving the judges to work out the jurisdiction for themselves. The change of ruling in 1844 was therefore clearly proved for and made manifest by the Constitution itself. (a) The power to pass a general election law is explicitly given to Con-

gress by the Constitution, within well defined limits, and those limits have been carefully respected. (b) The Supreme Court's decision in favor of the constitutionality of legal-tender paper currency has not been received with unanimous or enthusiastic applause. At best it is but permissive, and the decision of but one branch of the government. When we shall have a Congress which will issue legal-tender paper in time of peace, and a President who will not veto the act, the "instance" will be a fair one; until then, *nil dicimus*.—EDITOR.

like part of the great sum now yearly paid to this army would be saved to the people.

Is there a single duty performed by the State governments, or any of them, which could not be done as well, or better, by the government of the nation? If not, why should the State governments continue to exist? Why not dispense with them, erase the State lines, make of the whole population one people, governed by one code of laws, and have in reality a government "of the people, by the people, for the people"?

LAFAYETTE, IND.

Robert Jones.

II. THE FEDERAL BALANCE.

ON the deck of a westward-bound Atlantic steamer, one breezy September day, some years ago, I was asked by a distinguished gentleman, who had indeed been an English cabinet minister, to recommend some book from which he might get a rudimentary knowledge of the system of government in the United States. "For," said he, "we don't understand you. We cannot see why your vast size does not lessen cohesion and make you fall apart; nor do we understand why you will not go to pieces in the dangerous process of electing a chief magistrate." Of course I pointed out to him the fact that the President had neither the power nor the responsibility of an English prime-minister, and, in short, that ours was not a parliamentary government. This surprised him, and he replied with frankness: "Ah! we do not understand you."

But on thinking over the words of this right honorable and very intelligent gentleman, I have to confess that one of the dangers that he pointed out was a real one. So long as a hope of party advantage prevents the legislature of the country from agreeing upon some authoritative board of arbitration in case of a difference regarding an electoral count between the two Houses of Congress, the national peace will be threatened whenever we have to pass the ordeal of electing a chief ruler.

Against the danger from incohesion I urged the good fortune of our Federal system — that the central government was relieved of severe strain by the localization of a great part of our legislative work. Massachusetts, with her Puritan history, regulates all matters pertaining to morals and manners — all matters that have to do with the degree and character of civilization — by her local legislature. Louisiana, with her French antecedents, is allowed to respect her traditions and those sentiments that are the slow growth of generations, and to evolve a civilization on her own soil, in her own way. The danger which this English statesman saw in the vast extent of our country and the heterogeneity of its people would be a real one, if it were possible for a body of Pennsylvania Presbyterians and Massachusetts Puritans to organize a party to make Sunday laws for New Orleans. It would be real if reformers could not pass a law regulating the liquor traffic in Maine without consulting the representatives from Nevada, Arkansas, and the Bourbon district of Kentucky.

This notion of a lack of stability in the American government from the heterogeneousness of its people is an old one with Englishmen. In 1759, not to mention any earlier example, there came to this country the Rev. Andrew Burnaby, afterward Archdeacon of Leicester, who entered the colonies by way of York River and journeyed to the northward as far as the

Piscataqua. When the American opposition to English schemes for taxing the colonies had raised the whirlwind, he published in 1773 his "Travels Through the Middle Settlements in North America." In this he ventures to make some forecasts. He does not think that the colonies can ever be voluntarily associated in one government, "for fire and water," says he, "are not more heterogeneous than the different colonies in North America. Nothing can exceed the jealousy and emulation which they possess in regard to each other." "Indeed," he says in another place, "it appears to me a doubtful point, even supposing all the colonies of America were to be united under one head, whether it would be possible to keep in due order and government so wide and extended an empire."

The trouble with Burnaby's forecast is a trouble with all such predictions. It is impossible to take into account beforehand all the elements of a complex problem. Among a good many elements here which he did not foresee is the Federal system, which is more the offspring of fortunate accident than of wise statesmanship. The centrifugal jealousy of the several colonies, with their separate histories, local sentiments, and particular interests, offered resistance to the centralizing theories of statesmen; the result was not a perfect balance between central and local governments, but an adjustment that has proved itself to be most useful and truly conservative. Railroads, newspapers, telegraphs, and the abolition of slavery have made us much more homogeneous than we were. But differences of climate and productions, of inland and sea-coast location, of mountain and plain, of local history, derivation, and traditional sentiment, will happily intervene to prevent our falling into a flat uniformity of character. And society will advance more rapidly and more safely if each State is allowed to work out its own destiny by the attrition of the forces that make up its life. Among these forces history and tradition are everywhere of the strongest. To all time New England will show traces of the town-community, independent-church, and common-land systems of her infancy; Virginia must on the other hand grow by counties, for there every county has its traditions of the ancestors who administered justice on the bench of magistrates in the county court, and who now and then maintained the old notions of gentlemanliness by notifying royal governors of their unwillingness to sit with a man, no matter how high in court favor, who was of doubtful integrity. Louisiana again will cast her history into the mold of a territory checkered off into parishes, as that of Delaware is into hundreds.

I do not discuss the Federal system with any apprehension of danger that in any proximate time a serious attempt will be made to change the skeleton of the government. Any arguments for or against a radical change in our system can have only an academic interest. It is hard to abolish organized history by enactment. Political *vis inertiae* is too great. Even among an idealistic people like the French, so great a change could be wrought only by the devastations of some great social upheaval. Our danger is of a different sort. The Federal system offers a barrier to many respectable movements for social reform, where reforms seek the aid of law, and there is always a temptation to take a short cut by appealing to Congress. There are temperance reformers, for example, who think that if they can

prohibit the making of spirits by a clause in the Constitution of the United States they will dry up the foundations of evil. There are labor reformers, anti-monopolists, and anti-divorce reformers who believe that the easiest way to achieve their ends is to get sweeping enactment by Congress. Even so cautious a paper as the New York "Evening Post" has advocated the passage of a uniform marriage law. Reformers are prone to forget the impotence of law when it is not reenforced by public sentiment. Nor is it to be expected that a special reformer, consecrated to one cause the importance of which is naturally magnified in his own eyes, should be patient enough to understand that every load of this sort put upon the Federal government is a disturbance of adjustment in a system that is strong enough to hold a great and growing empire only so long as its balance is maintained. Civilizing work must in the main be done locally. A short leverage is highly advantageous in the distribution of funds.

A better illustration of the necessity for cherishing the independence of local communities can hardly be found than the evil harvest reaped by all attempts to govern the city of New York at Albany. City bills are ill-wells for the local legislator, who knows that constituencies on the lakes will hardly ever inquire why the streets of the metropolis are voted to corporations, and its funds wasted on fruitless jobs.

Pennsylvania, in making laws for capital and labor, keeps her eyes on the multitudinous miners and toilers in car-shops, blast-furnaces, and rolling-mills, with their trades-unions, sometimes their Molly Maguires. The conditions are very different in South Carolina, where the planter often hires a negro laborer at a stipulated price "with board," which board means a peck of meal and a definite ration of bacon for each week, to be cooked and eaten at the pleasure of the working man, who also is content to add to this allowance any "luxuries" at his own expense. All such questions, in so vast a country, ought to be handled on the ground in the light of local customs; any attempt to regulate them from Washington would produce an unheard-of crop of demagogism and corruption. How poorly the central government of a republic can administer local affairs is shown in the anarchy of the reconstruction period and in the calamities of the District of Columbia.

The Federal arrangement which came to us by the good fortune of the diversity of interest and character of the thirteen colonies, is now in process of application with deliberate purpose to the British Empire, which will have its American and its Australian confederation. One day it will have, perhaps, an East Indian system of a similar sort. The hold of Great Britain on her colonies has not been weakened but visibly strengthened by the gift of local autonomy to remote provinces. The laws for Scotland are virtually made by the Scotch members before they are finally adopted by the British Parliament. And the only apparent solution to the Irish difficulty will be in some similar division of power between the local and the imperial authority.

The moral for us on this side is that we must keep the imperial government of the United States for imperial purposes, that it may be strong and free to deal with the collective interests of a vast empire, liable some day to become yet greater by the force of gravitation and absorption; and that we ought to resist the best re-

form in the world if its ends can only be achieved by reducing the liberty of the States to deal with questions of manners, morals, minor commerce, and local interests.

Edward Eggleston.

Pundita Ramabai Sarasvati.*

THIS distinguished high-caste Brahmin woman is the daughter of a Marathi priest who suffered persecution for educating the women of his family. But, retiring to the seclusion of the Ganga-mûl, their studies were continued amid the sublimities of nature, which have left their impress on Ramabai's mind. At the age of sixteen years Ramabai was left an orphan, and three years later, fully convinced of the importance of woman's education, she traveled under the protection of her brother across India, urging in all places the emancipation and education of women. Arrived at Calcutta, the older pundits paid her homage, and the title of Sarasvati was conferred upon her. The simplicity of her manners and her earnest, eloquent arguments won distinction at home and commanded attention abroad. In her travels Ramabai had mingled freely with the people, disregarding of caste, not electing to be the leader of a new sect, but everywhere seeking truth for truth's own sake and inspiring others with the same wholesome ambition. After a short illness her brother died, and six months later she married a Bengalese gentleman—a Sanscrit scholar and a pleader-at-law, the man of her own choice. His death in less than two years after marriage left her at twenty-four years of age to face the future as a Hindu widow. Again she sought the rostrum. Two particular measures now filled her mind,—the introduction of women physicians and the preparation of widows for teachers in girls' schools. The plans now taking shape in India for the establishment of hospitals and the investiture of women physicians are believed to have had their origin in the faithful labors of Ramabai. The fruitage of her efforts for girls' schools has also appeared. In the city of Poona, Ramabai formed a society of the leading Brahmin ladies, called Arya Mâhila Somaj, for the encouragement of the education of women, with branch societies in the cities she visited. Poona now has not only primary schools for girls, but also two high schools; Bombay has two or three high schools, and Calcutta has the Victoria school, from which women may enter the university.

To acquaint herself with better methods of advancing her work, Ramabai went to England. Another book in native language to speak in her absence was her parting gift to India. In England, whither her fame had preceded her, Ramabai was warmly received. Professor Max Müller and other Oxford professors approved her scholarship, and she was appointed to the chair of Sanscrit in the Woman's College at Cheltenham. Here she remained until February, 1886, when her cousin, Dr. Joshee, also a Hindu Brahmin lady of high caste, took the degree of doctor of medicine at the Woman's Medical College of Pennsylvania, and the Pundita extended her travels to "this holy land of America." That a Hindu woman should leave her country and journey alone beyond the seas, could not be without a tinge of romance

*See also "The High-caste Hindu Woman," by Ramabai, with an introduction by Dean Rachel L. Bodley, of Woman's Medical College, Philadelphia.

or a spirit of lofty courage and consecration. In this instance it was the latter, and even the heart of this resolute woman, who had twice crossed the kingdom of India, would have quailed had she not trusted in him wholed Abraham forth to find riches, honor, and power. The conversion of Ramabai to Christianity illustrates her sincerity of soul and her love of truth. Having renounced Brahminism and not yet accepted Christianity, her marriage ceremony was performed by a civil magistrate. With other progressive Hindus, Ramabai accepted Theism as an advance on Hinduism, and, without becoming identified, was closely associated, with the Bramo-Somaj. The progressive Hindus accepted Ramabai's leadership and hoped through her philosophy "to regenerate society and establish a pure Theistic religion." But Theism vanished with a clear conception of Christianity. Ramabai says of her brother, "His great thought during his illness was for me, what would become of me left alone in the world. To relieve his anxiety, I answered, 'There is no one but God to care for you and me.' 'Ah,' he replied, 'if God cares for us, I am afraid of nothing.'" Ramabai's soul was gradually unfolding to divine truth, and she and her daughter Manorama were baptized, after their arrival in England, into the church universal, and accepted the Bible and the Apostles' Creed. Ramabai believes in the unity of the world and the unity of the Church.

Emily J. Bryant.

A Ministry of Welcome.

IN Dr. Edward E. Hale's paper on "Church Union," in the June CENTURY, he says: "And if the Christians

of a dozen different communions choose to unite, to maintain at Castle Garden a ministry of welcome, such as the Mormon Church alone does choose to maintain there," etc. Will you permit me to say that the Mormon Church is not *alone* in maintaining such "a ministry of welcome"? More than a score of years ago the Evangelical Lutheran Church placed a missionary at Castle Garden to welcome, direct, and assist emigrants from Germany. This work was subsequently enlarged, to embrace those coming from Scandinavia. Out of this there came, in time, two large buildings, opposite Castle Garden, in which the spiritual and material interests of immigrants are cared for. These institutions are in correspondence with similar institutions in the old world, so that emigrants leave the old world with letters to the "ministry of welcome" in the new.

The Lincoln History.

TO THE EDITOR OF THE CENTURY.

SIR: If your note on the "Lincoln History" in the July CENTURY was intended as an apology for the space given to preliminary facts, let me have the pleasure of saying that not many of your older readers, and certainly not *one* of your younger readers, could afford to have one sentence in the chapters thus far published omitted. Let us have a fitting historical perspective for such a grand figure as the writers of that history are painting.

AMSTERDAM, N. Y.

Sincerely, *M. D. J.*

BRIC-À-BRAC.

Transformation.

IF it be true that Time doth change
Each fiber, nerve, and bone,
That in a seven years' circling range
New out of old hath grown,

Time's a magician who hath made
A mystery passing strange:—
No outward symbol is displayed
To hint the subtle change.

Whate'er the magic he hath wrought
Within his seven years' span,
Your life is yet with beauty fraught
As when the charm began.

The rounded form of other years
Still keeps its crowning grace;
And June, for April's earlier tears,
Plants roses on your face.

But your great beauty touches me
Now, in no other way
Than doth the splendor of the sea,
The glory of the day.

I dreamed I loved you in past years,—
Ah! that was long ago.
How far the time-blown love-vane veers
This rhyme may serve to show.

The shifting seasons soon enough
Beheld the bright dream fade:—
I learned to know the fragile stuff
Of which some dreams are made.

We meet now, with a kid-gloved touch,—
Mere courtesy, each to each;
That earlier hand-clasp overmuch
Outvies our later speech.

And so, perhaps, it may be true
That, as you pass me by
In careless wise, you are not you,
And I'm no longer I.

A. C. Gordon.

A STUDY IN BLACK.

"WHERE you' son get dis 'mawkable talent from, Mister Bradish?"

"Entirely it come from my side of de house, sah. My fadder before me was po'ter in a picture-gallery for six yeahs befo' he died, an' ef you know I done have de sole dist'n' of Marse Crawford's picters while I was in his sarvice, sah."

Uncle Esek's Wisdom.

If a man has made up his mind to be a hypocrite, let him be a big one; I know of nothing meaner or more wicked than a third-rate one.

WHENEVER I read a pompous and abstruse sentence, I find the idea in it weak; it is always safe to trust a strong thought to simple language.

THE man who can count his friends upon his fingers is comparatively safe.

YOU can restrain the bold, guide the impetuous, and encourage the timid, but for the weak there is no help; you might as well undertake to stand a wet string up on end.

THERE are lots of things in the world that are like molasses candy in one respect,—half of a stick is sweeter than the whole.

FASHION makes fools of some, cowards of many, and apes of all.

Uncle Esek.

Face to Face.

IDLING not long ago upon the street
They named for him who was our country's sire
In the brave town where Wit and Wisdom meet
Daily — for human freedom to conspire —

My vagrant glance within a bookstore spied
Two portraits — one of him whose mummied clay,
With dark devices of rare spices dried,
Science identified the other day.

Rameses, Pharaoh — many names had he,
And many slaves toiled hard to rear his tomb
Pyramidal 'twixt the Nile's fertility
And the sad, billowy desert's silvery gloom.

The other portrait was the homely face
Of him whose pen-stroke made a nation free,
And raised to civic rank an alien race,
Dark heritors of a centuried slavery.

Lincoln and Pharaoh! Was it chance alone,
Or some design behind the shopman's hand,
By which these lithographs were quaintly thrown
Together, for a contrast strangely grand?

For these two faces typify indeed
Two forces ever within the soul
Of man — that earthworm of material greed,
That glorious moth who dreams a starry goal.

Nay, more: these faces typify, besides,
The powers of Progress and Conservatism,
That make the nations rise and fall in tides
Forward and backward on Time's dark abysm.

But of the men themselves, what may we say,
Since Pentaur's verse on Luxor's pictured wall
Sufficeth Ram'ses' fame, and Lowell's lay
Of Lincoln's greatness hath so well said all —

Save this: One reared an altar unto Fame,
Cemented by the sweat and blood of men;
The other to earth's highest office came
To widen all men's liberty — and then

To fall a victim to a madman's hate.
Just as his country rose again sublime,
Beautiful, though ensanguined! Oh! strange fate!
O most pathetic mystery of all time!

Henry W. Austin.

Between the Lines.

BETWEEN the lines the smoke hung low,
And shells flew screaming to and fro,
While blue or gray in sharp distress
Rode fast, their shattered lines to press
Again upon the lingering foe.

'Tis past — and now the roses blow
Where war was waging years ago,
And naught exists save friendliness
Between the lines.

To you who made the traveler know
In southern homes how warm hearts glow,
Let even this halting verse express
Some measure of true thankfulness,
And grateful, loving memory show
Between the lines.

Walter Learned.

Hard to Suit.

"I WOULD not mind their coming back, you know,"
The lady said, the day her verses went,
"If only they'd refuse the lines on 'Snow'
Before it's time for 'Roses' to be sent."

Upon the steps a postman's eager tread;
Quick! take the envelope, serenely white:—
"Returned with thanks."— And then the lady said,
"I think they might have kept it overnight."

A. W. R.

Doubtful — Very.

LONG years ago, as those may know
Who watched her toils infold me,
Among the beaux of Mam'selle Rose
A freak of fate enrolled me;
And in her train no silly swain
So often told the story
That foolish Youth mistakes for truth,
And whispers *con amore*.

But Rose, the jade, who had betrayed
A score or more before me,
With cruel glee rejoiced to see
The hopes and fears that tore me;
And while intense grew my suspense,
She dallied, smiling, pouting,
With pretty art, until my heart
Was sore with too much doubting.

The dear coquette! She loved to fret
Her gallants *à la* Circe,
Yet in her breast lurked unconfessed
A sweet and tender mercy;
For when I left her, sad, bereft
Of joy, and dumb with sorrow,
She hung her head and softly said:
"It *might* be 'yes' to-morrow!"

M. E. W.

A Sea-side Flirtation.

WITH sorrow in her eyes of blue,
With trembling hands, she slowly penned it —
The little parting *billet doux*
That conscience told her now should end it.
Those *tête-à-tête* along the shore,
Those gipsyings with fern-filled basket,
Must join the dear delights of yore
And only live in memory's casket.

There never was a heart like Jack's:
He told his passion in his glances.
She sealed her note with scented wax,
But could not drown her dismal fancies.
When he should read his suit denied,
So long the theme of idle gazers,
She pictured him a suicide,
And shuddered at the thought of razors!

At last she slept — but not till dawn
Had blossomed through the ocean vapors.
Jack conned her missive with a yawn
When he had read the morning papers.
He gave his beard a languid twirl,
And murmured as he sat a-smoking:
"Tear-stained — By Jove! — poor little girl —
I thought she knew that I was joking!"

ELY CATHEDRAL.

THE little town of Ely and its enormous cathedral church stand on what I hardly dare to call a hill, so certain is the word to convey too large an image. Nowhere but in this vast, low, and monotonous fen-country would so gradual a rise in the ground to so gentle an elevation, be fitted with the term. Only the sea is broader, flatter, more uniform than the fen-lands,—only the sea from whose inroads and saturations they were themselves so slowly and so painfully reclaimed. In elder days the ships of the Northman or the Norman could come up nearly to the base of the church; and the River Ouse was but the largest of the many waxing and waning streams that wound their sluggish way through bogs and pools and marshes. Now the Ouse itself is shrunk almost to a rivulet, and the wide quagmires are cultivated fields. But “the fen-country” and the “Isle of Ely” are still names in current use, and without effort imagination can reconstruct conditions which made them literally appropriate.

I.

If the railway brings us northward from Cambridge we follow almost the line of that old Roman Akeman Street which for long after it was built must have been a causeway rather than a road through a great part of its course. This approach to Ely is too direct for the cathedral to be seen until we have nearly reached it. But if we come westward from Norwich, it looms up on the horizon as a

great solitary ship looms up at sea. As we draw nearer, it preserves its isolated distinctness of outline, lifted visibly above the plain, yet so little lifted that its bulk seems all the greater, being very near the eye. As we leave the outlying station and drive into the town, still the church appears to grow in size. It is one of the very largest and most imposing, one of the most individual, and distinctly the most varied, in England, while the town is quite the smallest that is dignified by the name of a “cathedral city.” The census gives Ely seven thousand inhabitants, but it seems a mystery where they house themselves, for the casual eye would not guess a third as many. A short and narrow main street with three or four others opening out of it; a little market-place; one medieval church in addition to the cathedral; the ecclesiastical dwellings with an adjacent grammar-school; a pretty, ancient-looking group of almshouses; a few mills, and then the limitless low plain with sparsely scattered modest suburban homes,—that is all there is of Ely. All the houses, though of stone, are low and simple, and few have any touch of that quaint picturesqueness for which we always hope in England.

But though it is so little and so simple, Ely is a neat, bright, cheerful place, with the most spotless inn that ever went by the spotless name of “The Lamb”. And we would not have it bigger or braver, lest the church’s look of entire supremacy should have a less splendid accent. It is big enough to surround the church with an atmosphere of happy human companionship, and this atmosphere is increased by the unusually intimate way in which church and town are grouped together. Unlike the west porch of Peterborough, the west porch of Ely is not set back behind gates and greensward, but opens directly on the main street, which cuts through the Close. The chief

portions of the Close lie immediately around the building, to south and east and north. But on the other side of the street stretches a triangular lawn, bordered by great trees and on one side by the bishop's palace. So the close association of the cathedral with the town does not deprive even its western front of a typically English foreground of green.

Though the town of Ely has always been thus insignificant in itself, its name, as the name of its powerful bishopric and of the powerful men who ruled it, has had a mighty sound in English history. No English see save Durham only had greater temporal power than Ely; and its bishops almost without exception were through all the Catholic centuries among the foremost priests and statesmen of their times.

II.

SUCH a district as the fen-country offered peculiar attractions to the founders of monasteries. Long before the coming of the Danes it rivaled, both in the number and in the sanctity of its "houses," even that far south-western district where Glastonbury's house was chief among so many. Thorney, Ramsey, Peterborough, Crowland, and Ely were but the wealthiest and most populous of the eastern monaste-

ries. Ely was one of the first of them to be established and one of the earliest to grow to greatness, its founder being a saint of wide renown. Ethelberta, a princess of the East Anglian house, had had from her childhood a leaning towards the religious life. Her domestic experience with two successive husbands was therefore somewhat stormy. The first gave her the Isle of Ely by way of dower. Hither, aided by many miracles, she finally succeeded in escaping from the second — King Egfrid of Northumbria — and here, in the year 673, she founded a home for ecclesiastics of both sexes, and was herself installed as abbess.

When, two centuries later, the Danish rovers came, the holy women who dwelt beneath St. Ethelberta's roof were scattered and slain like the "merry monks of Croyland" and of Peterborough. A small body of secular clergy was soon installed in their stead, but the place was unimportant for a hundred years. Then it was restored to greatness by the same hands that at the same time were restoring Peterborough. Here also a large body of Benedictines were settled, and here also King Edgar's piety was lavishly expressed.

Ely now rapidly grew again in wealth and power until its abbots were thought worthy to alternate with those of Glastonbury and of St. Augustine's at Canterbury in holding the high

WEST FRONT OF THE CATHEDRAL AND THE BISHOP'S PALACE.

THE CATHEDRAL AND THE SPIRE OF ST. MARY'S CHURCH, FROM THE SOUTH-WEST.

office of Chancellors of the court. Canute seems to have taken it under his special protection, and modern children still learn the verse he improvised when he heard the monkish chanting from his boat upon the Ouse.* Most of the tales which profess to explain the tragic fate of his step-son Alfred point to Ely as the place of the boy's confinement, blinding, death, and burial. On the altar of Ely Edward the Confessor was presented as an infant, and within its walls he spent some of his childish years.

When the land was torn by insurrections against the Conqueror's new-gained power, Ely became conspicuous in a military way. From 1066 to 1071 the Isle was the best stronghold of the English, being so easy to defend, so difficult to approach, through its treacherous watery surroundings. Here, was that famous "Camp of Refuge" which, under the rule of Hereward and of Abbot

Thurstan, made a last long desperate resistance to the Norman. Only William's advent in person brought about its capture in 1071, and only when it was captured was his hold upon his new realm so far secured that he could venture upon a visit to his old realm across the straits. Most of the defenders of the camp were taken and executed. But Thurstan made his peace with William, and Hereward seems to have escaped. There are numerous vague and contradictory tales about his after career; but he vanished out of even half-authentic history at the taking of the Isle of Ely.

The monastery itself was not disturbed by William, and ten years later Simeon, its Norman abbot, began the construction of a new and larger abbey-church.

III.

THE site of this new church — which gradually grew into the building of to-day — was chosen a little to the eastward of the old English structure. How much actual work was done by Simeon we do not know. But choir and transepts and central tower were complete

* This, I believe, is the earliest extant version of Canute's words, written down some two centuries later than his day:

"*Meotungon the Marcsches binnan Ely
Tha Cnut ching rew ther by.
Rowe ye cnites noer the lant,
And here we thes Moneches sang.*"

in the time of his successor Richard, who, in 1106, removed the bodies of St. Ethelberta and of three other canonized abbesses, her corresponding end of the opposite aisle in 1550. These, of course, are in the Perpendicular style and the last named in its very latest phase.

ACROSS THE FENS.

relatives, from the old church to the new. At about the same time, in the reign of Henry I., the bishopric of Ely was created and the abbey-church became a cathedral.

In later Norman days the nave was built. As the Norman style was passing into the Early English, the western end was constructed with its single great tower in the center of the façade and its spreading transept-wings and turrets. When the Early English style was in its fullest development a porch or "Galilee" was built out in front of the west door, and the whole east limb was pulled down and greatly enlarged. About a hundred years later — in 1332 — the central tower fell, carrying with it the four adjacent bays of this new choir. Reconstruction was begun in the same year (the Decorated style being now in use) and was finished soon after the middle of the century, by which time a wholly new Lady Chapel had also been completed. A large chantry or sepulchral chapel was built into the east end of one choir-aisle in 1500, and another into the

Thus we see there is no medieval fashion whatsoever that we may not study in some important part of Ely's mighty frame.

IV.

THE Galilee or western porch is 43 feet in depth. With its rich outer and inner portals, its capitals carved with delicate curling leafage, its side arcades in double rows of trefoiled arches, and the profuse but exquisitely refined "dog-tooth" enrichment of its moldings, it is one of the loveliest things that man ever built and one of the most individually English in its loveliness. Yet less than a century ago an Englishman who was pleased to call himself an architect and a "restorer" advised its destruction, together with that of the western transept, saying that they were things "neither useful nor ornamental and not worth preserving!"

When we have passed the inner doorway of this porch, we find ourselves in another ves-

triale, beneath the western tower. Double tiers of richly arcaded galleries run around it, and to the south the transept stretches out, with a chapel in its eastern face. The northern arm of the transept is gone, as our view of the west front shows. There is no record to tell when or why it perished; but it cannot have stood more than a hundred and fifty years at longest, for there are signs to prove that a reconstruction was begun in the Decorated period.

All the work in this western end is very rich — Transitional below, pure Early English above, the one style passing into the other very naturally, and pointed arches succeeding semicircles without a hint of discord. There could not be a better place than this to illustrate a great general fact with regard to mediæval architecture — the fact that, however distinct and different its main styles may be in their complete development, one was never deliberately, suddenly changed for another; the fact that there were transitional times between them when each grew out of the foregoing by a slow process of natural development.

Through the great inner arch of this vestibule — lowered and widened by Perpendicular alterations — we see the long perspective of the Norman nave most effectively emphasized. Again, as at Peterborough, the contrast with the luxuriant Transitional work we are leaving behind us is very great. Here, indeed, it is an even greater contrast; for the nave is still simpler in design — the great triforium openings not being subdivided by coupled lower arches — and is even less embellished by the chisel. Here, there are not even zigzags on the moldings; nothing but fluted cushion capitals and a single line of hatched decoration on the lower string-course. It is not quite so fine a nave as Peterborough's, for the vastness of the triforium openings, showing so plainly the roughly boarded aisles-roofs behind them, gives it a somewhat emptier air. But it has the same

general effect of grandeur and supreme solemnity, and the same almost tunnel-like length and narrowness. If we are used to continental planning, a narrow Anglo-Norman nave has more the look of a superb approach to some huge sanctuary than the look of an integral part of the sanctuary itself.

The main transepts — all that is left of the first two abbots' work — have two aisles like the nave and are similar to it in design. Arcaded

WESTERN PART OF THE CATHEDRAL, FROM A GARDEN IN THE CLOSE.

galleries along their ends, however, give these portions a much richer accent.

The eastern parts of the choir — the presbytery and retro-choir, the parts that were uninjured by the falling of the tower — form as admirable a specimen of Early English (Lancet-Pointed) work as the island has to show. Each of the great stone piers between central alley and side aisles is set about with eight slender isolated dark-marble shafts, the capitals of the whole group uniting in a wreath of lovely knotted foliage. The arches are molded with an infinite intricacy of hollows and ridges,

infinitely effective yet delicate in their contrast of dark and brilliant lines. None of the openings in the outer walls are traceried;* but the inner triforium-arcade, over the main arches, has each of its great openings filled by two smaller trefoiled lights resting on marble shafts; and between the heads of these are bold open quatrefoils. The clere-story windows are in tall lancet groups of three. The ribs of the vaulted stone roof are continued in great clusters down the wall between the triforium-

* I speak of the original scheme; — all through the church very many of the outer windows, both in the

arches till they rest upon long corbels, carved as masses of rich foliage, which insert themselves between the arch-heads of the main arcade. Such corbels as these are purely English features. In France we find instead true vaulting-shafts which spring from the great capitals. The French device is certainly the more "constructional." But when the English is as beautifully used as it is at Ely, it has infinite richness and a sufficient expression of stability as well.

But it is the east end which is most thoroughly English and most beautiful — a great flat wall filled with tall lancet groups. Below are three immense and richly molded lights of equal height; and above are five smaller lights, diminishing in height from the center out. These five are set in the outer face of the thick wall, and its inner face is worked into a corresponding open arcade. As the curve of the vault impinges somewhat upon the side lights of this arcade, their heads are curiously flattened into an irregular shape. How naïve, how frankly bold were these medieval artists, even at a day when their art had grown so elaborate, so refined, so subtle! A modern architect would scarcely dare to tamper with his forms in such a way — and yet it is a way which, despite the awkward curves that it produces, does not really distress the eye. Its reasons are too immediately apparent and too valid.

V.

Now, having seen what are the four arms of the cross, let us see what is the place where all four meet. Beautiful as is all the rest of its fabric, individual as are many parts of it, the crossing is Ely's great feature — at once its most unique and its most triumphantly successful. Peterborough's great feature, as I have said, is undated, and the name of its builder is unknown. But at Ely we are more fortunately instructed.

When the old tower fell John Hotham was bishop of the see, and under him as sub-prior and sacrist of the convent was one Alan of Walsingham. Hotham is entitled to the credit of securing funds to begin the reconstruction and of bequeathing great sums to complete it. But the sacrist was his executive; and the credit of conceiving the freshest and grandest idea that ever took concrete shape on English soil is Alan of Walsingham's.

A glance at the ground-plan will show what this conception was.

Walsingham did not rebuild in their original place the four great angle-piers which had sustained the tower and connect them again by four arches parallel with the walls of the church

upper and in the lower stages, were filled with traceried at a time long after they were built.

and of equal width with its four central alleys only; he swept away the remains of the old piers and made eight angle-piers instead of four, strengthening for this purpose the final piers of those arcades which mark off the side aisles in each of the limbs. The central space thus became an octagon, and, taking in the whole breadth of the church instead of the breadth of the central alleys only, its area became three times as extensive as before. Eight arches surrounded it, four opening into the main alleys on either hand and four opening slantwise into the aisles. The former are, of course, immensely wide; and they are proportionately tall, rising as high as the main roofs and having their heads filled in with open tracery. The intermediate ones are much narrower and are low. But above each of them rises a solid space of wall, ornamented with a rich arcade for statuary; and above this again, free over the aisles-roofs, an immense traceried window whose top corresponds in height and shape with the top of the four larger arches. Between the heads of these windows and large arches rise great clusters of vaulting shafts converging inward for a space and then bearing aloft a tall central lantern, also octagonal and also pierced with wide traceried windows.

Thus Alan of Walsingham, as Ferguson says,* "alone of all the architects of Northern Europe, seems to have conceived the idea of getting rid of what in fact was the bathos of the style,—the tall narrow opening of the central tower, which, though possessing exaggerated height, gave neither space nor dignity to the principal feature." Thus, he adds, he formed "the only Gothic dome in existence, though Italian architects had done the same thing and the method was in common use with the Byzantines."

Certainly Walsingham's scheme is a splendid improvement upon the usual English interior scheme, whether we consider it for pure beauty of effect, for practical convenience, or for expressional potency. Certainly it forms the only Gothic dome in existence, if we mean by a dome a circular or polygonal roof which upholds a central lantern pierced for light. Other Gothic domes there are which form a simple unbroken, unpierced sweep above our heads. They are very few, but there is one in Portugal, and there is a splendid one at Prague with a clear reach from wall to wall of 75 feet, somewhat more than the floor measure of the octagon at Ely. There is also one about two-thirds as large in England itself, in the chapter-house at York. But this last is built of wood, while the continental examples are of stone.

I must hasten to confess, that Alan of Wal-

* *History of Architecture.*

singham's dome is also of wood—the clusters of vaulting-shafts, the vault, the upper octagon with its traceried lights; everything, in fact, above the crown of the great arches. Of course the contrast between wood and stone was hidden by the painter's brush; but the impressiveness, if not the charm, of the construction is lessened when we know its substance.

Apart from this, the execution of Alan's work is as beautiful as its conception is fresh and strong. Nowhere in all the vast treasury of medieval art do we find features more graceful in themselves, more harmonious with each other, better fitted in size and shape and relative richness for the service they must render. Nowhere is there more variety or a more complete unity. Nowhere is there a more organic air of growth from foundations to summit, a more complete yet unexaggerated expression of verticality. As in all perfect Gothic work, the roof "governs everything"—has dictated every line and form below. The vaulting shafts are not borne by corbels as in the less "constructional," more typically English way, but start from the floor in groups of three great rolls which, at the level of the minor arches, are subdivided into many smaller moldings that rise to the capitals of the greater arches and there bear similar capitals, which in their turn support the incurving clusters of the ribs that form the vault itself. The breaking-up of the three lower rolls into many is beautifully masked by great projecting canopied niches for statues, which compose most effectively with the arcaded niches on the plain walls below the windows.

Puritan hands worked havoc with this wonderful piece of art, and modern hands have not been very skillful in restoring it. The new statues which fill the old niches are fairly good; but the glass in the windows is not good, and the vault is painted in a gaudy pattern where magenta "swears at" vivid green. But even so, the main conception is uninjured, and enough details remain to tell what must once have been the effect. There is no spot where an architect may better study what was meant, in the very greatest days of Pointed architecture, by a fine idea, perfectly carried out and exquisitely adorned.

VI.

THE three choir bays next to the octagon (those ruined by the fall of the old tower) were rebuilt as soon as the octagon itself was finished. They are also in the Decorated style; but their unlikeness to the earlier work is so apparent that one can hardly think Walsingham designed them, though one knows he was still alive and still high in honor in the convent.

The later work is often cited as the most perfect and splendid example of Decorated Gothic in all England. It is indeed very splendid, and is very perfect as regards its execution and details. But in its general scheme it

of view. Then each successive generation of builders showed so wise a regard for the original scheme that the string-courses come everywhere at the same level, and the height of the arcades is everywhere alike; and this fact pre-

THE OUSE.

is not really so fine, so *good*, as the work in the octagon. Grace and richness are conspicuous in both; but in the octagon they are subordinated to strength and simplicity, while in the choir they show plainly as the first things that were considered. The arches are a little weak in outline, and the gorgeous traceries that fill the upper tiers are so elaborate and fragile-looking that they seem more like frost-work than like carven stone. The result has almost a cloying richness, almost a pretty loveliness. There is a certain kind of painting which studio slang calls "sweet"; and I think there is just a touch too much of "sweetness" in this very beautiful part of Ely.

Diverse in style as are the several parts of this interior, its general effect is far more harmonious than is usually the case under similar conditions. The octagon distinctly separates, yet vitally connects, the newer portions with the older, and forms a dominant center towards which the eye returns from every point

vents any look of inorganic patching, greatly as forms and details have been made to differ.

The choir and the aisles are vaulted, in some parts very elaborately; but the nave is covered by a wooden ceiling. Once it was flat; but it had to be raised in the middle to accommodate Walsingham's tall arch, and now shows steeply canted sides with a flat central portion. It was decorated some twenty-five years ago by a non-professional artist whose soft pale tints are exceptionally harmonious.

The Lady Chapel is another work of Walsingham's. Such a chapel was commonly given the most honorable place in the church — eastward of the presbytery, where it formed a retro-choir often of enormous size. But when there was a local saint of especial sanctity the Virgin was sometimes displaced. Thus it was at Canterbury where St. Thomas claimed the retro-choir, and thus it was at Ely where it was given to St. Ethelberta. In both these cases the

Lady Chapel was built out eastward from the north arm of the transept.

At Ely it is what we might call a beautiful great room rather than a chapel,—a rectangle 170 feet in length with five windows on each side and a single huge window at each end. The west window was inserted in 1374; but even the east window, which was contemporaneous with the walls (1321–1340), shows in its tracery the near approach of Perpendicular fashions. All the other details, however, are pure Decorated and are incomparably rich. Or, to speak more truly, they were incomparably rich before the Protestants laid hands upon them. The ceiling is a delicate net-work of small ribs, intertwined in complicated patterns. All along the walls beneath the windows run elaborate arcades with little canopied niches, and between the windows are similar niches of the most intricate loveliness. Traces remain to show that the reredos which stretches across beneath the east window was once connected with it by a wide raised platform; and on this platform, relieved against the translucent splendor of the glass, doubtless stood that great figure of the Virgin which is often mentioned in the monastery records. A myriad of smaller figures once filled all the niches, but the Puritans left not one remaining and grievously shattered the dainty foliage and moldings which supported and enshrined them. The stone from which all the carvings were wrought is pure white and very soft — almost like chalk in texture. Naturally it yielded but too easily to axe and hammer; and only a few fragments remain of the beautifully intermingled tints of soft red and blue and green which once set off or wholly sheathed its whiteness.

VII.

GREAT names begin very early to appear on the list of Ely's bishops. The second holder of the title, Nigel, — appointed in 1133, — had been Treasurer to Henry I., and like his uncle Roger, the famous Bishop of Salisbury, was a prominent actor in the wars of King Stephen's reign. Personally extravagant and politically ambitious, he robbed his see with the boldest hand, and even stripped the shrine of St. Ethelberta of its silver covering. At first for Stephen and then for Matilda, he was besieged at Devizes, and would again have stood a siege in Ely itself had not Stephen surprised the Isle before its defenses were complete. But when the troubles were over he made his peace with Stephen, and after the accession of Henry II. became one of the Barons of the Exchequer. The castle he built at Ely has wholly disappeared.

Next to him came Geoffrey Ridel, who was

also a Baron of the Exchequer, also a prominent statesman, and so strong a supporter of the king against the archbishop that after Becket's murder he was forced to clear himself under oath from charges of complicity. At Ely one forgets his worldly deeds, remembering him as the constructor of the west façade.

Then came William Longchamp, Chancellor and Grand Justiciary of Richard I. During his life the temporal power of the bishops of Ely rose to its highest point, for when the king went a-crusading the bishops of Ely and of Durham were severally intrusted with the rule of the kingdom north and south of the Trent. But even half a loaf of supreme authority was not enough for Longchamp, who arrested his colleague and, "assuming the utmost pomp and state, treated the kingdom as if it were his own, bestowing all places in Church and State on his relations and dependants." Prince John resisting him, he shut himself up in the Tower of London, but was forced to flee, was captured at Dover, and exiled to Normandy. Forgiven by Richard on his return, he was Chancellor until his death.

The next bishop of Ely, Eustace, was the next Chancellor too. His chief merit was the stand he took for national freedom, opposing King John and being one of the three bishops who published the interdict of the Pope. Yet the merit of building the Galilee at Ely adds a further luster to his name.

Three bishops followed Eustace who were not quite so prominent, and then in 1229 came Hugh of Northwold, who went as ambassador on various royal missions, and sumptuously entertained royal guests when he had brought the Early English choir of his cathedral to completion and was once more "translating" the bodies of the sainted abbesses; as a reward for all of which, one supposes, he was buried at St. Ethelberta's feet.

William of Kilkenny followed — another Chancellor — and then Hugh of Balsham, who in 1280 founded the first college at Cambridge and dedicated it to St. Peter. Then came John of Kirkby, treasurer of the realm, and so little of an ecclesiastic that he stepped from deacon's to priest's orders only after his appointment to the see and only the day before his consecration.

The next bishop was William de Luda, "a lordly man and eminent in the sciences," one of the commissioners who settled peace with France for Edward I., and the chief mediator between the clergy and this king. The tomb in which he was buried is one of the most magnificent in Ely.

In 1316 came that Bishop Hotham whose name I have already cited. Even his great architectural labors must have seemed unim-

DISTANT VIEW OF THE CATHEDRAL, FROM THE SOUTH.

portant to his contemporaries compared with the greater public labors which filled his life. He was first Treasurer and then Lord Chancellor. He took the field against Robert Bruce and narrowly escaped capture at Mytton-upon-Swale. He arranged the subsequent truce with Scotland and then was sent to settle the affairs of Gascony. The Great Seal was again confided to him after the abdication of Edward II. This, one might think, was work enough for any man. Yet Ely never had a more devoted incumbent than Hotham. He not only caused the rebuilding of the crossing and the construction of the Lady Chapel, but left much money in his will for the restoration of the choir; and he also secured legislation which vastly profited the revenues of the church, and purchased for it great tracts of land adjoining that manor of Holborn, which one of his predecessors had given to the see — great tracts that are now in the very heart of London. He too was buried in a splendid tomb that still stands in the cathedral.

One of the richest and most powerful of English sees, Ely was naturally one of those with whose affairs the popes were most constantly interfering. Often we read of some

papal *protégé* made bishop in opposition to local wishes; and though as a rule no issues seem deader to-day than these (except, of course, as illustrating that great conflict with Rome upon which so much of England's history hinges), one such act of papal interference still excites a living interest, a poignant, if sentimental, regret. This was the act which excluded from Ely's *cathedra* Alan of Walsingham, whom the monks had previously elected prior and whom they now desired for bishop.

Bishop De Lisle sat in his stead, and we reap sentimental consolation from the fact that he proved "a haughty and magnificent prelate, little in favor either with his convent or with the king," had a vexed career, and died at Avignon, whither he had fled to the shelter of the papal wing.

After him came Simon Langham and John Barnet, each successively Treasurer of England. During Barnet's time the king restored and restocked certain manors belonging to the see which had been denuded by De Lisle and the king himself. The wealth possessed by such establishments is shown by the list of these manors which, too, were only the chief among others: the palace at Ely; Ely House

in Holborn; Bishop's Hatfield and Hadham in Hertfordshire; Balsham and Ditton in Cambridgeshire; Somersham in Huntingdonshire; Downham, Wisbech Castle, and Doddington in the Isle of Ely. The nature of the average incumbent of the time is as clearly illustrated by the fact that every subsequent bishop on the day of his enthronization was obliged to take oath beneath the west door of Ely that

Yet so much stronger is the voice of art than the voices of history and topography combined, that most of us know Morton only as "My Lord of Ely" whom Richard asks for "good strawberries" from his Holborn garden.

This man of science was succeeded by a man of art,—John Alcock. Very often the ecclesiastic who was the reputed builder of great works

THE LANTERN, FROM THE NORTH-EAST.

he would transmit unimpaired to his successors the wealth now given him in charge.

Bishop Arundel was Lord Chancellor and rebuilt the palace in Holborn. Bishop Fordham was Lord Treasurer under Richard II., and is the *Ely* who sings second to the *Archbishop of Canterbury* in the opening scenes of Shakspeare's "Henry V." Then came Bishop Morgan, still another statesman, and then Louis de Luxembourg who had been Archbishop of Rouen and a faithful friend of the English in France. Next to him in the line stands Thomas Bourchier, and next but one to Bourchier stands John Morton. Both of these are actors in the scenes of "Richard III."—Morton as actual bishop of Ely, Bourchier as then promoted to be Primate of all England.

Morton was a very skillful engineer and one of the first systematically to attempt the draining of the great north fens. He cut a canal forty miles from near Peterborough to the sea, and built a big brick tower on top of which he often sat to superintend the work. The canal is still called "Morton's Seam."

really deserved no higher title than their architect's paymaster or employer. But Alcock seems to have been himself an architect. He was Controller of the Royal Works and Buildings under Henry VII., and we shall see on another page how much he built at Ely.

It is hard to omit any name from this long list of bishops, so incessantly do the great names follow one another. In 1515, for example, was appointed Nicholas West, who had been a famous lawyer and a frequent ambassador; who had gone with Henry VIII. to the Camp of the Field of the Cloth of Gold, and who afterwards braved his master and took a bold stand for Catherine of Aragon; who, although a baker's son, was the most sumptuous prelate of his day, having more than one hundred servants, and the most charitable, feeding two hundred paupers daily at his gates; and who is appropriately sepulchered in that very lovely chapel which speaks the last word of English Gothic art.

Then there was Bishop Goodrich, who was also a great legal authority and had sided with Henry against his queen; who supported

THE CATHEDRAL AND THE LADY CHAPEL, FROM THE SOUTH-EAST.

the Reformation and destroyed the shrines of those holy Ely women whom so many of his predecessors had delighted to honor; who helped to revise the translation of the Bible and helped to rule the kingdom as Chancellor for the young king Edward.

There was Bishop Thirlby, who was appointed by Queen Mary and went as her ambassador to Rome to swear anew England's allegiance to the Pope. He performed the ceremony of degradation over Archbishop Cranmer, but was man enough to weep as he did it. He was man enough, too, to submit to ten years' confinement at Lambeth rather than take the oath of ecclesiastical submission to Elizabeth.

Next to him came Richard Cox, who helped to draw up the Thirty-nine Articles and who long and valiantly resisted the queen's encroachments upon the Church — especially as they threatened his own rich manor of Holborn. It was to Cox and with reference to this manor that the queen wrote the famous letter:

"PROUD PRELATE,—You know what you were before I made you what you are; if you do not immediately comply with my request, by God I will unfrock you.— ELIZABETH."

Eighty years later than Cox—in 1638—Matthew Wren was installed at Ely, "an excellent hater of Puritans," a loyal supporter of Laud, a "man of sour, severe nature," a stern ecclesiastical disciplinarian, and an occu-

pant for eighteen years of the Tower of London,—chiefly individualized to us as that uncle of Sir Christopher Wren whose merits and woes are sympathetically referred to in the *Parentalia*.

While Wren sat in the Tower—between the two terms when he sat at Ely—the power of Cromwell rose and fell. At Ely it did not work quite the havoc it worked elsewhere—but this is not to say that it worked little. Ely was the scene of that incident which Carlyle relates with such infinite gusto. It was the Rev. Mr. Hitch of Ely to whom Cromwell had unavailingly written that he should "forbear altogether the choir-service, so unedifying and offensive, lest the soldiers should in any tumultuary or disorderly way attempt the reformation of the cathedral church." It was under the octagon of Ely that Cromwell therefore appeared in person, "with a rabble at his heels, and his hat on," to shout "'leave off your fooling and come down, Sir,' . . . in a voice . . . which Mr. Hitch did now instantaneously give ear to."

Since the Reformation there have been many good men and true in the chair of Ely—scholars, theologians, preachers, and patrons of learning; men doubtless much better as regards the heart, which no man seeth, than most of their mighty forerunners. But those deeds of theirs which man can see have

had no such significance, either political or architectural, that their names need be cited here. The great days of prelatical influence and the great days of constructive art saw their suns set together.

by still further illuminating her name and extending her influence, and by constantly bequeathing her the riches they had gained in the outer world.

Let us go back now to the cathedral for a

ELY, FROM UNDER THE RAILWAY BRIDGE.

On the other hand, the mighty men whose names we have just read have not had a tithe of their varied distinctions told. The duties they had performed, the honors they had reaped, before they became bishops of Ely, have barely been referred to; and their after careers have scarcely in a single case been suggested. Many of them were bishops of other sees before or after their appointment to Ely. Several of them were cardinals of Rome. Some of them were distinguished in literature as well as in worldly affairs, in science, and in art. Death hardly removed more of them than promotion; there was no more prolific nursery of archbishops than the Isle of Ely.

The power of a see, in medieval times, vastly assisted but did not make the power and fame of the men who bore its title. Even a bishop of Ely, if a weak man or a dull man, was not loaded with secular dignities and bidden to control the destinies of England. Yet the power of Ely is illustrated none the less by the frequency with which the names of leading statesmen are associated with her own. If her chair was not the sole source of her prelates' fame, it was one of England's chief rewards for fame, and one of the surest stepping-stones to still higher eminence. The assistance given was mutual, of course. Ely helped her bishops on in life, and they helped her on

moment and see what there remains to speak of some among them.

VIII.

THE great architectural labors of the earlier bishops have already been mentioned. By the middle of the fourteenth century there was nothing left to do for the cathedral save to add minor features and to make minor alterations. The alterations mostly took the form of changes made in the windows for the insertion of more splendid glass; and the minor features usually took the shape of tombs destined to receive their builders or constructed to do honor to their immediate predecessors.

The most conspicuous tombs are those square chapels or chantries which finish the choir aisles to the eastward. The one to the north was built by John Alcock—the bishop-architect—for his own use. Completed by 1500, it is in a late version of the Perpendicular manner, though it contains the early-Deco-

rated windows which had stood in the aisle-end before the chapel was formed. The walls are covered all over with complicated tabernacle-work, and the roof has elaborate fan-vaulting. The sculptured details show a wealth of curious fancies, and here and there occurs the bishop's device, a cock standing on a globe,—a punning representation of the syllables of the name such as one often finds in medieval art of every age.

Nothing could be intrinsically lovelier than this little chapel; and it gains additional interest from the character of its design. It dates from the middle of the sixteenth century, and shows Renaissance mingled with the Gothic details. Work of this sort is not very common in English churches, for most of it was put into monuments and accessory features which fell a prey either to the Reformation or to that modern devastator, "restoration," which in Eng-

THE CATHEDRAL, FROM THE SOUTH.

The south chapel is that of Bishop West, the baker's magnificent son. It too is paneled throughout with tabernacle-work, which still shows rich leafage designed on the smallest scale yet with infinite vigor and spirit, and which once had each tiny niche filled with a figure that was not more than a few inches high. Two or three heads are all that remain, thanks, of course, to the Reformers. But these are quite enough to show that the figures, too, were instinct with life and force and character, despite their minute scale. The whole is carved of the same soft white stone which was used in the Lady Chapel, and seems to have been colored in a way which left the figures white against tinted backgrounds and encircling ornaments.

land has had so stupid and cruel a hatred for everything that it does not think "pure" in art,—that is, for everything which is not medieval. Even when such work is found it is seldom attractive, for English hands rarely used early-Renaissance motives well. The great loveliness of this chapel, therefore, its infinite grace and delicacy, its supreme refinement, the extraordinary skill with which medieval and classical elements are blended into a coherent and harmonious design,—all these qualities give color to the tradition that it was carved by Italian hands and perhaps by the hands of Torrigiano, who lived long in England and whose most famous work is the tomb of Henry VII. at Westminster.

In each of these chapels is the tomb of its founder, ruined by the Puritans.

In the choir is a splendid series of other episcopal tombs, whose rich canopies were fortunately respected even when the bodies and the effigies of those who lay beneath them were disturbed and the accessory saints' figures were annihilated. One is the sepulcher of the "lordly" De Luda — an elaborate canopy with trefoiled arches and great groups of pinnacles at each end. It has been atrociously colored in modern times and, the tomb itself being gone, the central space is used as a door-way by which one passes from the aisle into the choir!

This is a thirteenth-century tomb, and near it is a fine one of the fourteenth century, — Bishop Barnet's. Bishop Hotham's still more splendid fourteenth-century sepulcher — a tomb proper surmounted by a lofty shrine — stood practically intact till a hundred years ago, when the same vandal who counseled the destruction of the Galilee-porch broke it in two. The tomb now stands on one side of the choir, and on the other stands the vacant shrine with its open lower and its closed upper story, the latter having once been richly carved and arranged to support a seven-branched candlestick. Bishop Redman's Perpendicular monument, on the contrary, is almost perfect. A paneled tomb supports his recumbent figure beneath a canopy with three lace-like arches and complicated open paneling above. Bishop Northwold's and Bishop Kilkenny's Early English and Louis of Luxembourg's Perpendicular sepulchers also stand, the last-named with a mutilated headless figure of its tenant.

But I cannot go through the whole list of the tombs and brasses, episcopal and lay, which fill the choir of Ely so full of architectural and historic charm. I can only note the superb range of choir-stalls designed by Alan of Walsingham, and then make place for an epigrammatic epitaph, cut on a small brass plate, which has now disappeared but was legible not many years ago. It dated, I believe, from the seventeenth century:

	{ Tyndall by birth, Coxee by choice, { Upcher in age and for comfort.
Ursula	

IX.

It is time now that we should glance at the exterior of the cathedral.

There are more beautiful west fronts in the world than this, but there is none in England so imposing; and in all England there is none the least like it among cathedral fronts and none quite like it in any church of lesser rank. Parish churches often have a single western tower, but no other cathedral church has; and

I think no parish church shows such a tower supported by these wide spreading wings and these angle turrets. The upper lantern of the tower, added in the Decorated period, had originally a tall slender wooden spire; but this was removed in the course of the last century's "restorations."

The north side of the church is as varied as it is beautiful. Its long Norman nave has had rich later traceries inserted in many of its windows. Then come the transepts, Norman again, and the Decorated Lady Chapel; and then the lovely Decorated and Lancet-Pointed reaches of the choir, each buttress crowned by a lofty fretted pinnacle. Here we get a good view of the octagon.

Marking how well its low broad rich bulk contrasts with the tall sturdiness of the western tower, we feel the reasons for two facts. We see why other architects were not likely to reproduce Walsingham's design, and we see why he himself could be content with it. His scheme is incomparably beautiful inside the church, but no tall and massive tower could have been borne by such a substructure. A long low English church absolutely needed such a tower. Only here at Ely — only here where there was a single great western tower — was a broad, light lantern preferable. Here it would have been hard to build a central tower which should rival the western one. Even had this been accomplished, the effect of two such features, set in the same line and striving for preëminence, would have been far from happy. Fine though it is, the outline of Ely suffers by comparison with such outlines as Canterbury's, as Salisbury's, as Lichfield's, or Lincoln's. But it is the finest that could have been secured by a builder working under Walsingham's conditions. He was exceptional indeed among English builders in having such a chance to think most of his interior effect — to think most of this and yet do the best that could be done for exterior effect as well. His octagon with its lantern was the best possible feature for Ely — but of no other English church would the same words be true.

The east end of the church is even more beautiful without than within. For outside the two ranges of lights which showed from within are topped by a higher range, still differently grouped, which illumines the space between ceiling and outer roof, and by a group of quatrefoils in the gable-point. All the ranges are completed by the arcades which adorn the tall turret-like buttresses. The Decorated window of Bishop Alcock's chapel and the Perpendicular window of Bishop West's add variety to, but scarcely hurt the unity of, this beautiful composition.

x.

ALL about the church the greensward comes close up to the foundations and stretches away in broad level lawns. To the south lie the main portions of the Close, like a thickly wooded park, and the many fragments of the old conventual buildings.

Of the cloisters which formed a square contiguous to the nave only a piece or two remain. But we still have the Monk's and Prior's Doors, which gave access to the south aisle of the nave. Both are Norman, and the latter is extremely rich and lovely, with elaborate jambs the carving of which seems to show a lingering Celtic influence, and with a figure of Christ supported by angels in the tympanum that has an almost Byzantine air.

The Chapter House has wholly perished, but parts of the late-Norman Infirmary remain, ingeniously built in, like similar parts at Peterborough, to form the modern canons' houses.

The plan of an old conventual hospital was like the plan of a church. A nave formed the main hall; two aisles were subdivided into chambers for the sick, and a chapel was thrown out like a chancel at one end. The Infirmary nave at Ely now forms a roofless passage-way between the modern houses, spanned still by the chancel-arch; and the piers and arches which marked off the aisles form part and parcel of their walls on either hand. One house has been made with but little alteration from a separate hall that was designed by Walsingham for the use of convalescents.

The Deanery has been constructed out of the old thirteenth-century *Guesten Hall*. Near it was the Prior's house of which certain parts remain, together with a lovely little chapel. This bears Prior Crawdon's name, but in all likelihood was another work of Walsingham's. It is now the chapel of the grammar-school or college which was founded by Henry VIII. and which still flourishes under ecclesiastical control. The school itself and its masters are housed in a long range of buildings, forming the western boundary of the south Close, into which are built multitudinous fragments of the ancient convent. Off to the southward is "Ely Porta," once the main entrance to the

monastery. In its present form, a wide archway with a large room above, it dates from about 1400.

The bishop's palace, facing on the isolated lawn which lies west of the cathedral, dates chiefly from the time of Henry VII.—that is, from the time of Bishop Alcock. The turreted wings which still stand are his, but the huge hall and galleries he built have disappeared. I believe it was one of his galleries which bridged the street and united the palace with the church at the corner of the south-western transept.

It is a beautiful, quaint, and stately pile, this palace; and Prior Crawdon's chapel and all the adjacent school-buildings are infinitely picturesque,—not imposing like the palace, but low and vine-clad, gray and lovely, wholly and peculiarly English in their charm. Even a hurrying school-boy whom we met one sunny afternoon could see the pleasure in our eyes. It seemed only natural that he should exclaim, amid many pretty blushes, "You are quite welcome to sketch the houses if you want to—almost everybody does!"

One of the best views of the cathedral is from the railroad station whence we look north-westward and, seeing it in the near middle-distance, realize its enormous length and the stern majesty of the tall tower that rises like a great cliff in a land where man might well build cliffs since nature had built none. Another is from a mound called Cherry Hill in the south Close, whence we see it stretching over massy sweeps of foliage. Still another is from an elevation where the water-works of the town have been erected, some two miles towards the west.

But one need hardly seek for best points of view at Ely. There is no spot whence the great queen of the fen-lands may not be well seen, until we get so far away that it drops behind the horizon's rim. Wherever, however we see it, it is always imposing, always superb, always tremendous,—from far or near, from north, south, east, or west. Nowhere is there a more magnificent piece of human handiwork, and nowhere does nature seem more wholly to efface herself that human handiwork may profit.

M. G. van Rensselaer.

INTERPRETATION.

A SORROWER went his way along,
And I heard him sing and say:
The noon is bright, but soon the night
Will come, the grave of the day.

Then I smiled to hear his woful song
And sent this word for nay:
The noon is bright, but the blackest night
Cradles another day.

Richard E. Burton.

ABRAHAM LINCOLN: A HISTORY.*

THE SECESSION MOVEMENT.

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE CABINET CABAL.

EXTRACTS FROM FLOYD'S DIARY.*

VERY soon after the effort to unite the cotton-State governors in the revolutionary plot, we find the local conspiracy at Charleston in communication with the central cabal at Washington. It is neces-

sary to bear in mind that at the time of which we write, James Buchanan of Pennsylvania was still President of the United States, and that his Cabinet consisted of the following members: Lewis Cass of Michigan, Secretary of State; Howell Cobb of Georgia, Secretary of the Treasury; John B. Floyd of Virginia, Secretary of War; Isaac Toucey of Connecticut, Secretary of the Navy; Jacob Thompson of Mississippi, Secretary of the Interior; Joseph Holt of Kentucky, Postmaster-General; and Jeremiah S. Black of Pennsylvania, Attorney-General. It was in and about this Cabinet that the central secession cabal formed itself. Even if we could know in detail the successive steps that led to the establishment of this intercourse, which so quickly became "both semi-official and confidential," it could add nothing to the force of the principal fact that the conspiracy was in its earliest stages efficient in perverting the resources and instrumentalities of the Government of the United States to its destruction. That a United States Senator, a Secretary of War, an Assistant Secretary of State, and no doubt sundry minor functionaries were already then, from six to eight weeks before any pretense of secession, with "malice aforethought" organizing armed resistance to the Constitution and laws they had sworn to support, stands forth in the following correspondence too plainly to be misunderstood. As a fitting preface to this correspondence, a few short paragraphs may be quoted from the private diary of Secretary of War Floyd, from which longer and more important extracts appear in a subsequent chapter. Those at present quoted are designed more especially to show the names of the persons composing the primary group of this central cabal, and the time and place of their early consultations and activity.

"November 8th, 1860. . . . I had a long conversation to-day with General Lane, the candidate for Vice-President on the ticket with Mr. Breckinridge. He was grave and extremely earnest; said that resistance to the anti-slavery feeling of the North was hopeless, and that nothing was left to the South but 'resistance or dishonor'; that if the South failed to act with promptness and decision in vindication of her rights, she would have to make up her mind to give up first her honor and then her slaves. He thought disunion inevitable, and said when the hour came that his services could be useful, he would offer them unhesitatingly to the South. I called to see the President this evening, but found him at the State Department engaged upon his message and did not see him. Miss Lane returned last evening from Philadelphia, where she had been for some time on a visit. Mr. W. H. Trescott, Assistant Secretary of State, called to see me this evening, and conversed at length upon the condition of things in South Carolina, of which State he is a native. He expressed no sort of doubt whatever of his State separating from the Union. He brought me a letter from Mr. Drayton, the agent of the State, proposing to buy ten thousand muskets for the use of the State. . . .

"November 10th. . . . Beach, Thompson, and Cobb came over with me from Cabinet and staid, taking informally a family dinner. The party was free and communicative; Toucey would not stay for dinner. Mr. Pickens, late Minister to Russia, came in after dinner with Mr. Trescott, Assistant Secretary of State, and sat an hour, talking about the distracted state of public feeling at the South. He seemed to think the time had come for decisive measures to be taken by the South.

"November 11th. I spent an hour at the President's, where I met Thompson, Robert McGraw, and some others; we sat around the tea-table, and discussed the disunion movements of the South. This seems to be the absorbing topic everywhere.

"November 12th. Dispatched the ordinary business of the department; dined at 5 o'clock; Mr. Pickens, late Minister to Russia, Mr. Trescott, Mr. Secretary Thompson, Mr. McGraw, Mr. Browne, editor of the 'Constitution,' were of the party. The chief topic of discussion was, as usual, the excitement in the South. The belief seemed to be that disunion was inevitable; Pickens, usually very cool and conservative, was excited and warm. My own conservatism seems in these discussions to be unusual and almost misplaced."

TRESCOTT TO RHETT.

"WASHINGTON, Nov. 1st, 1860.

"DEAR RHETT: I received your letter this morning. As to my views or opinions of the Administration, I can, of course, say nothing. As to Mr. Cobb's views, he is willing that I should communicate them to you, in order that they may aid you in forming your own

* Printed on pages 791 to 794 in "The Life and Times of Robert E. Lee," etc. By a distinguished Southern journalist. (E. A. Pollard, author of "The Lost Cause.")

judgment; but, you will understand that this is confidential — that is, neither Mr. Cobb nor myself must be quoted as the source of your information. I will not dwell on this, as you will, on a moment's reflection, see the embarrassments which might be produced by any *authorized* statement of his opinions. I will only add, by way of preface, that after the very fullest and freest conversations with him, I feel sure of his earnestness, singleness of purpose, and resolution in the whole matter.

"Mr. Cobb believes that the time is come for resistance; that upon the election of Lincoln, Georgia ought to secede from the Union, and that she will do so; that Georgia and every other State should, as far as secession, act for herself, resuming her delegated powers, and thus put herself in position to consult with other sovereign States who take the same ground. After the secession is effected, then will be the time to consult. But he is of opinion, most strongly, that whatever action is resolved on should be consummated on the 4th of March, not before.

"That while the action determined on should be decisive and irrevocable, its initial should be the 4th of March. He is opposed to any Southern convention, merely for the purpose of consultation. If a Southern convention is held, it must be of delegates empowered to *act*, whose action is at once binding on the States they represent.

"But he desires me to impress upon you his conviction, that any attempt to precipitate the actual issue upon this Administration will be most mischievous — calculated to produce differences of opinion and destroy unanimity. He thinks it of great importance that the cotton crop should go forward at once, and that the money should be in the hands of the people, that the cry of popular distress shall not be heard at the outset of this move.

"My own opinion is that it would be well to have a discreet man, one who knows the value of silence, who can listen wisely, present in Milledgeville, at the meeting of the State Legislature, as there will be there an outside gathering of the very ablest men of that State.

"And the next point, that you should, at the earliest possible day of the session of our own Legislature, elect a man as governor whose name and character will conciliate as well as give confidence to all the men of the State,—if we do act, I really think this half the battle,—a man upon whose temper the State can rely.

"I say nothing about a convention, as I understand, on all hands, that that is a fixed fact, and I have confined myself to answering your question. I will be much obliged to you if you will write me soon and fully from Columbia.

"It is impossible to write you, with the constant interruption of the office, and as you want Cobb's opinions, not mine, I send this to you. Yours,

"W. H. T." *

THOS. F. DRAYTON TO GOVERNOR GIST.

"CHARLESTON, 3d Nov., 1860.

"On the 22d of last month I was in Washington, and called upon the Secretary at War, in company with Senator Wigfall of Texas, to make inquiries as to the efficiency and price of certain muskets belonging to the United States, which had been altered by the Ordnance Department from flint to percussion. They will shoot for 200 yards as well as any smooth-bored gun in the service, and if *rifled* will be effective at 500 yards. But if the conical ball will be made lighter by enlarging the hollow at the base of the cone, the effective range may be increased to 700 yards. Should your Excellency give a favorable consideration to the above, I can have the whole of what I have stated authenticated by the board of ordnance officers,

* Lossing, "Civil War." Vol. I., p. 44.

who inspected and reported to the Secretary at War upon these muskets. If 10,000 or more of these muskets are purchased, the price will be two (\$2) dollars each; for a less quantity the charge will be \$2.50 each. If a portion or all of them are to be rifled, the Secretary says he will have it done for the additional cost of (\$1) one dollar per barrel. As this interview with Mr. Secretary Floyd was both semi-official and confidential, your Excellency will readily see the necessity, should this matter be pursued further, of appointing an agent to negotiate with him, rather than conduct the negotiation directly between the State and the Department. . . . I unhesitatingly advise purchasing several thousand of them. . . . There are many other important facts in connection with the above that I could disclose, but will reserve them for some other occasion, that I may give them verbally as soon as I can find a day to wait upon your Excellency in Columbia.

"The State of Texas has engaged twenty thousand (20,000) of these muskets, and the State of Kentucky purchased several thousand last summer." †

THOS. F. DRAYTON TO GOVERNOR GIST.

"CHARLESTON, 6th Nov., 1860.

"I have only within a few hours received yours of the 5th inst., authorizing me to purchase from the War Department at Washington 10,000 rifles of pattern and price indicated in my letter to your Excellency of the 3d inst.

"I accept the appointment and will discharge the duty assigned to the best of my ability and with the least possible delay. For I feel that the past and present agitation are ruinous to our peace and prosperity and that our only remedy is to break up with dispatch the present Confederacy and construct a new and better one. I will communicate with Mr. Secretary Floyd to-night and have the rifles put in preparation so as to have them for use at an early day. . . .

"I would wish that my agency in this transaction be kept private *until I reach Washington*, or indeed till I write to say the arms are on their way to Columbia. . . ."

THOS. F. DRAYTON TO GOVERNOR GIST.

"CHARLESTON, 8th Nov., 1860.

"I have just received your letter of the 7th inst., and I think I can render you all the information you desire, without resorting to any agent. If my ability can only be made to keep pace with my zeal, I hope yet to render some service to the dear old State of South Carolina." †

THOS. F. DRAYTON TO GOVERNOR GIST.

"CHARLESTON, 16th Nov., 1860.

"I have been most reluctantly detained here by an accidental fall, and also by business of an urgent kind associated with the railroad. My absence from Washington, however, has not delayed the execution of your order for the rifles: the Secretary of War has had the preparation of them in hand for some time.

"When I write to you from Washington, had I not better address you through your private secretary . . . Please address me at Washington to the care of Wm. H. Trescott, Esq. . . . I will give strict attention to your letter of the 7th inst., and hope to furnish you with much of the information you desire, for I am quite sensible of the importance of knowing the views and policy of the President at this juncture." †

THOS. F. DRAYTON TO GOVERNOR GIST.

"WASHINGTON, 19th Nov., 1860.

". . . . I called this morning upon the Secretary of War to make arrangements for the immediate trans-

† MS. Confederate Archives, War Department.

mission of the rifles to Columbia, but much to my astonishment he informed me that since he had looked over the report of "Small Fire-arms" (now inclosed) that he found we had labored under an error in stating to me that the 10,000 rifles I had engaged were ready for delivery when called for by me. He said he could have them refilled, but it would take 3 or 4 months to execute the contract, but suggested that we should purchase the 10,000 smooth-bored muskets instead, as a more efficient arm, particularly if large-sized buckshot should be used, which, put up in wire case capable of containing 12 of them, would go splendidly through an inch plunk at 200 yards. I was much astonished at the result of my interview with Governor Floyd to-day, for he had not only informed me that the rifles would be ready for me on my arrival, but told Mr. Trescott so likewise, and that if I had been in Washington last Saturday I could have got them. . . . If you will be satisfied with the smooth-bored muskets like the specimen forwarded to you, I will purchase them. Better do this, although not the best pattern, than be without arms at a crisis like the present. Colonel Benjamin Huger can give you much information about these muskets. This is derived not only from Mr. Floyd, but also from General J. E. Johnston, Quartermaster-General, who was President of the Ordnance Board who had these muskets changed from flint to percussion, and also from smooth bore to rifle, and he says that for our purposes the smooth-bored musket is preferable to the altered rifle. The why I cannot explain to-day. . . . I also send you a letter from Mr. Trescott, in reply to certain inquiries from me. I am unable to make any comments upon them nor to add other facts which I will forward you more leisurely to-morrow. . . ."

TRESCOTT (ASST. SEC. STATE) TO DRAYTON.

"WASHINGTON, Nov. 19, 1860.

"(Private, Confidential.)

"MY DEAR DRAYTON: It is difficult to reply specifically to your inquiries, partly because I do not believe that the exact course of the Administration has been yet determined on, and partly because my knowledge, or rather my inference, of its intentions is derived from intercourse with its members which I am bound to consider confidential. I do not regard it of serious importance to you to know the individual opinions of either the President or the Cabinet. No action of any sort will be taken until the message has been sent indicating the opinions of the Executive, and that message, whatever it be, will find our legislature in session, and the convention on the point of meeting. I think it likely that the President will state forcibly what he considers the grievances of the South, that he will add that he does not think, if the right of secession existed, it would be a wise policy for the State to adopt, and that he does *not* think the right to secede does exist, and then refer the whole matter to Congress; what he will do when the State does secede, he has not said, and I do not know, nor any man, I believe. He will do, as we will, what he believes to be his duty, and that duty, I suppose, will be discharged in full view of the consequences following any line of action that may be determined on. But I think that, as long as Cobb and Thompson retain seats in the Cabinet, you may feel confident that no action has been taken which seriously affects the position of any Southern State.

"I think that I may safely rely upon my knowledge of what will be done, and you may rely upon my resignation as soon as that knowledge satisfies me of any move in a direction positively injurious to us, or altering the present condition of things to our disadvantage. When you pass through on Wednesday, however, I will speak to you more fully. Yours, W. H. T."*

THOS. F. DRAYTON TO GOVERNOR GIST.

"WASHINGTON, 10th Nov., 1860.

"Mr. Buchanan, while he can discover no authority under the Constitution to justify secession by a State, on the other hand he can find no power to coerce one to return after the right of secession has been exercised. He will not allow entry or clearance of a vessel except through the Custom-house, to be established as soon as secession is declared, upon the deck of a man-of-war off the harbor of Charleston. He will enforce the collection of duties, not by Navy, but by a Revenue Cutter, as our Collector now would do if his authority was resisted. I will write to you more fully when I return from New York, where I go to-morrow at daylight, at the suggestion of the Secretary of War, who deems it important that I should go there to make arrangements for shipping the arms (should you still want them) from that point instead of this city. . . . Do send a copy of the list of arms at the Arsenals to H. R. Lawton, Milledgeville, Ga. I am getting some smooth-bored muskets for Georgia, like the specimen I sent you. . . ."

THOS. F. DRAYTON TO GOVERNOR GIST.

"WASHINGTON, 23d Nov., 1860.

"I arrived here at 6 A. M. from New York, where I had gone at the suggestion of Mr. Floyd to engage Mr. G. B. Lamar, President of the Bank of the Republic, to make an offer to the Secretary for such a number of muskets as we might require. The Secretary at War was reluctant to dispose of them to me, preferring the intermediate agency. Mr. Lamar has consented to act accordingly, and to-day the Secretary has written to the commanding officer [at] Watervliet Arsenal to deliver five or ten thousand muskets (altered from flint to percussion) to Mr. Lamar's order. Mr. Lamar will pay the United States paymaster for them, and rely upon the State to repay him. I have been most fortunate in having been enabled to meet the payments for the arms through Mr. L., for I feel satisfied that without his intervention we could not have effected the purchase at this time. . . . I expect to return at daylight to-morrow to New York, for I am very anxious about getting possession of the arms at Watervliet, and forward them to Charleston. The Cabinet may break up at any moment, on differences of opinion with the President as to the rights of secession, and a new Secretary of War might stop the muskets going South, if not already on their way when he comes into office.

"I will write to you again by the next mail. The impression here and elsewhere among many Southern men is, that our senators have been precipitate in resigning; they think that their resignations should have been tendered from their seats after they had announced to the Senate that the State had seceded. Occupying their seats up to this period would have kept them in communication with senators from the South and assisted very powerfully in shaping to our advantage coming events."*

If any further quotation be necessary to show the audacity with which at least three Secretaries and one Assistant Secretary of Mr. Buchanan's Cabinet engaged in flagrant conspiracy in the early stages of rebellion, it may be found in an interview of Senator Clingman with the Secretary of the Interior, which the former has recorded in his speeches and writings as an interesting reminiscence. It may be doubted whether Secretary Thompson correctly reported the President as wishing him success in his North Carolina mission,

* MS. Confederate Archives, War Department.

but he is, of course, a competent witness to his own declarations and acts.

"About the middle of December (1860) I had occasion to see the Secretary of the Interior on some official business. On my entering the room, Mr. Thompson said to me, 'Clingman, I am glad you have called, for I intended presently to go up to the Senate to see you. I have been appointed a commissioner by the State of Mississippi to go down to North Carolina to get your State to secede, and I wished to talk with you about your Legislature before I start down in the morning to Raleigh, and to learn what you think of my chance of success.' I said to him, 'I did not know that you had resigned.' He answered, 'Oh, no, I have not resigned.' 'Then,' I replied, 'I suppose you resign in the morning.' 'No,' he answered, 'I do not intend to resign, for Mr. Buchanan wished us all to hold on, and to go out with him on the 4th of March.' 'But,' said I, 'does Mr. Buchanan know for what purpose you are going to North Carolina?' 'Certainly,' he said, 'he knows my object.' Being surprised by this statement, I told Mr. Thompson that Mr. Buchanan was probably so much perplexed by his situation that he had not fully considered the matter, and that as he was already involved in difficulty, we ought not to add to his burdens; and then suggested to Mr. Thompson that he had better see Mr. Buchanan again, and by way of inducing him to think the matter over, mention what I had been saying to him. Mr. Thompson said, 'Well, I can do so, but I think he fully understands it.' In the evening I met Mr. Thompson at a small social party, and as soon as I approached him, he said, 'I knew I could not be mistaken. I told Mr. Buchanan all you said, and he told me that he wished me to go, and hoped I might succeed.' I could not help exclaiming, 'Was there ever before any potentate who sent out his own Cabinet ministers to excite an insurrection against his government!' The fact that Mr. Thompson did go on the errand, and had a public reception before the Legislature, and returned to his position in the Cabinet is known, but this incident serves to recall it."*

To this sketch of the Cabinet cabal it is necessary to add the testimony of his participation, by one who, from first to last, was a principal and controlling actor. Jefferson Davis records that:

"In November, 1860, after the result of the presidential election was known, the governor of Mississippi, having issued his proclamation convoking a special session of the Legislature to consider the propriety of calling a convention, invited the senators and representatives of the State of Congress, to meet him for consultation as to the character of the message he should send to the Legislature when assembled. While engaged in the consultation with the governor just referred to, a telegraphic message was handed to me from two members of Mr. Buchanan's Cabinet, urging me to proceed 'immediately' to Washington. This dispatch was laid before the governor and the members of Congress from the State who were in conference with him, and it was decided that I should comply with the summons. On arrival at Washington, I found, as had been anticipated, that my presence there was desired on account of the influence which it was supposed I might exercise with the President (Mr. Buchanan) in relation to his forthcoming message to Congress. On paying my respects to the President, he told me that he had finished the rough

draft of his message, but that it was still open to revision and amendment, and that he would like to read it to me. He did so and very kindly accepted all the modifications which I suggested. The message was, however, afterward somewhat changed."†

Here is a substantial unmasking of the combined occult influence which presided over the initiatory steps of the great American Rebellion — its central council — the master wheel of its machinery — and the connecting relation which caused all its subordinate parts to move in harmonious accord.

With the same mind to dictate a secession message to a legislature and a non-coercion message to Congress — to assemble insurrectionary troops to seize Federal forts and withhold government troops from their protection — to incite governors to rebellion and overawe a weak President to a virtual abdication of his rightful authority, history need not wonder at the surprising unity and early success of the conspiracy against the Union.

THE PRESIDENT'S MESSAGE.

LESS than a month intervened between the November election at which Lincoln had been chosen and the annual session of Congress, which would meet on the first Monday of December, and it was necessary at once to begin the preparation of the annual message. Now indeed a golden opportunity presented itself to President Buchanan. The suffrages of his fellow-citizens had covered his political theories, his party measures, and his official administration with condemnation, in a perfect avalanche of ballots.‡ But the Charleston conspirators had within a very few days created for him a new issue overshadowing all the questions on which he had suffered political wreck. Since the 6th of November, the campaign of the Border Ruffians for the conquest of Kansas, and the wider congressional struggle for the possession of the Territories, might be treated as things of the past. Even had they still been pending issues, they paled into insignificance before the paramount question of disunion. Face to face with this danger, the adherents of Lincoln, of Douglas, of Bell, and the fraction of his own partisans in the free States would be compelled to sink minor discords, and as one man to follow the constitutional ruler in a constitutional defense of the laws, the flag, and the territory of the Union.

Without change of position, without recantation of principle, without abatement even of declared party doctrine, honestly executing

* "Speeches and Writings of T. L. Clingman," p. 526.

† Davis: "Rise and Fall of the Confederate Government," pages 57, 58, 59.

‡ 3,832,240 opposition popular votes against 847,953 for Breckinridge, the candidate championed by the President and his adherents.

only the high mandate of the Constitution, he could turn from the old issues and take up the new. A single stride, and from the flying leader of a discomfited rout, he might become the mailed hero of an overpowering host. Tradition, patriotism, duty, the sleepless motion of a solemn official oath, — all summoned him to take this step, and a brilliant precedent in presidential annals, an incident forever luminous in American history, assured him of the plaudits of posterity.

Unfortunately for himself and for his country, President Buchanan had neither the intellectual independence nor the courage equal to such an act of moral heroism. Of sincere patriotism and of blameless personal rectitude, he had reached political eminence by slow promotion through seniority, not by brilliancy of achievement. He was a politician, not a statesman. Of fair ability and great industry in his earlier life, the irresolution and passiveness of advancing age and physical infirmity were now upon him. Though from the great free State of Pennsylvania, he saw with Southern eyes and heard with Southern ears, and had convinced himself that the South was acting under the impulse of resentment arising from deliberate and persistent injuries from the North.

The fragment of an autograph diary from the pen of John B. Floyd, Secretary of War,* affords the exact evidence of the temper in which President Buchanan officially confronted the rebellion of the Southern States. The following are extracts from entries, on several days, beginning with November 7th, 1860, the day following the presidential election :

"WASHINGTON CITY, November 7th, 1860.

"... The President wrote me a note this evening, alluding to a rumor which reached the city to the effect that an armed force had attacked and carried the forts in Charleston Harbor. He desired me to visit him, which I did, and assured him that the rumor was altogether without foundation, and gave it as my opinion that there was no danger of such an attempt being made. We entered upon a general conversation upon the subject of disunion and discussed the probabilities of it pretty fully. We concurred in the opinion that all indications from the South looked as if disunion was inevitable. He said that whilst his reason told him there was great danger, yet his feelings repelled the convictions of his mind.

"Judge Black, the Attorney-General, was present during a part of the conversation, and indicated an opinion, that any attempt at disunion by a State should be put down by all the power of the Government.†

* Printed in "The Early Life, Campaigns, and Public Services of Robert E. Lee, with a record of the campaigns and heroic deeds of his companions in arms, by a distinguished Southern journalist." 8vo., E. B. Treat, Publisher, New York 1871, p. 789, article Major General John B. Floyd. It says: "Among his private papers examined after his death the fragment of a diary was found, written in his own hand, and which is here copied entire." The diary also bears internal evidence of genuineness.

"November 9th. . . . A Cabinet meeting was held as usual at 1 o'clock; all the members were present, and the President said the business of the meeting was the most important ever before the Cabinet since his induction into office. The question, he said, to be considered and discussed, was as to the course the Administration should advise him to pursue in relation to the threatening aspect of affairs in the South, and most particularly in South Carolina. After a considerable amount of desultory conversation, he asked the opinions of each member of the Cabinet as to what should be done or said relative to a suggestion which he threw out. His suggestion was that a proposition should be made for a general convention of the States as provided for under the Constitution, and to propose some plan of compromising the angry disputes between the North and the South. He said if this were done, and the North or non-slaveholding States should refuse it, the South would stand justified before the whole world for refusing longer to remain in a confederacy where her rights were so shamefully violated. He said he was compelled to notice at length the alarming condition of the country, and that he would not shrink from the duty.

"General Cass spoke with earnestness and much feeling about the impending crisis — admitted fully all the great wrongs and outrages which had been committed against the South by Northern fanaticism, and deplored it. But he was emphatic in his condemnation of the doctrine of secession by any State from the Union. He doubted the efficacy of the appeal for a convention, but seemed to think it might do well enough to try it. He spoke warmly in favor of using force to coerce a State that attempted to secede.

"Judge Black, the Attorney-General, was emphatic in his advocacy of coercion, and advocated earnestly the propriety of sending at once a strong force into the forts in Charleston Harbor, enough to deter if possible the people from any attempt at disunion. He seemed to favor the idea of an appeal for a general convention of all the States.

"Governor Cobb, the Secretary of the Treasury, declared his very decided approbation of the proposition, for two reasons — first, that it afforded the President a great opportunity for a high and statesmanlike treatment of the whole subject of agitation, and the proper remedies to prevent it; secondly, because, in his judgment, the failure to procure that redress which the South would be entitled to and would demand (and that failure he thought certain), would tend to unite the entire South in a decided disunion movement. He thought disunion inevitable, and under present circumstances most desirable.

"Mr. Holt, the Postmaster-General, thought the proposition for the convention dangerous, for the reason, that if the call should be made and it should fail to procure redress, those States which now are opposed to secession, might find themselves inclined, from a feeling of honor, to back the States resolving on disunion. Without this common demand and common failure, he thought there would be no such danger of united action, and therefore a stronger prospect of some future plan of reconciliation.

"Mr. Thompson, the Secretary of the Interior, thought well of the plan of calling for a general convention — thought his State (Mississippi) about equally

† The astounding mysteries and eccentricities of politics find illustration in the remarkable contrast between this recorded impulsive, off-hand and patriotic expression of Attorney-General Black, on November 7th, and his labored official opinion of an exactly opposite tenor, certified to the President under date of November 20th. See *Opinions of the Attorney-General*, Vol. IX, p. 517.

divided between the union and disunion men. He deprecated the idea of force, and said any show of it by the Government would instantly make Mississippi a unit in favor of disunion.

"Mr. Toucey, Secretary of the Navy, thought well of the appeal for the convention—coincided in an opinion I had expressed, that retaliatory State measures would prove most availing for bringing the Northern fanatics to their senses.

"I expressed myself decidedly opposed to any rash movement, and against the idea of secession at this time. I did so because I think that Lincoln's administration will fail, and be regarded as impotent for good or evil within four months after his inauguration. We are to meet to-morrow at 1 o'clock.

"November 10th. . . . We had a Cabinet meeting to-day, at which the President read a very elaborate document, prepared either as a part of his message or as a proclamation. It was well written in the main, and met with extravagant commendation from General Cass, Governor Toucey, Judge Black, and Mr. Holt. Cobb, Thompson, and myself found much to differ from in it,—Cobb because it inculcated submission to Lincoln's election and intimated the use of force to coerce a submission to his rule, and because it reprehended the policy of the Kansas-Nebraska bill; Thompson because of the doctrine of acquiescence and the hostility to the secession doctrine. I objected to it because I think it misses entirely the temper of the Southern people and attacks the true State-Rights doctrine on the subject of secession. I do not see what good can come of the paper, as prepared, and I do see how much mischief may flow from it."

It is extremely doubtful whether we may accept these extracts at their full literal import. Either the words "coerce," "submission," "use of force," and so on are written down by the diarist in a sense different from that in which they were spoken, or the President and several of his counselors underwent an amazing change of sentiment. But in a general way they show us that on the fourth day after Lincoln's election the Buchanan Cabinet was already divided into hostile camps. Cass of Michigan, Secretary of State, Toucey of Connecticut, Secretary of the Navy, Black of Pennsylvania, Attorney-General, and Holt of Kentucky, Postmaster-General, were emphatic Unionists; while Cobb of Georgia, Secretary of the Treasury, Thompson of Mississippi, Secretary of the Interior, and Floyd of Virginia, Secretary of War, were secessionists—the latter yet professing devotion to the Union, but with such ifs and buts as left sufficiently clear evidence of his inevitable drift to disloyalty.

All impulses of prudence or patriotism ought to have moved the President to reconstruct his Cabinet. But instead of some energetic executive act of this character, he seems to have applied himself to the composition of a

political essay to teach the North its duty; as if his single pen had power to change the will of the people of the United States upon a point which they had decided by their votes only four days previously after six years of discussion. In the draft of this document, which he read to his Cabinet on November 10th, we have the important record that "it inculcated submission to Lincoln's election, and intimated the use of force to coerce a submission to his rule,"—positions which Floyd records were "met with extravagant commendations from General Cass, Governor Toucey, Judge Black, and Mr. Holt." This was a true touchstone; it instantly brought out not only the open secessionism of Cobb and Thompson, but the disguised disloyalty of Floyd.

It is a strange historical phenomenon that with the President and a majority of the Cabinet in this frame of mind, the South should have been permitted to organize revolution. The solution seems to lie in the temporizing feebleness of Buchanan and in the superior finesse and daring conspiracy of Cobb, Thompson, and Floyd.

Many indications make it evident that a long and laborious factional struggle took place over the preparation of the President's message. The telegraph announced several protracted Cabinet sessions; and as early as the 21st of November the points under discussion and the attitude of the President and his several official advisers were accurately foreshadowed in the newspapers. Nor were these momentous deliberations confined to the Cabinet proper. All the varieties of suggestion and contradictory counsels which were solicited or tendered we may never learn, and yet we know enough to infer the highest extremes and antagonisms of doctrine and policy. On the one hand came Jefferson Davis, the future chief of the Rebellion, at the urgent call of his fellow-conspirators; on the other hand came Edwin M. Stanton, Buchanan's future Attorney-General and Lincoln's Secretary of War,* called in by Mr. Buchanan himself, to help him through the intricate maze of his perplexed opinions and inclinations. How many others may have come voluntarily or by summons it is impossible to guess. Many brains and hands, however, must have joined in the work, since the document is such a heterogeneous medley of conflicting theories, irreconcilable doctrines, impracticable and irrelevant suggestions. For at length the hesitating and bewildered Presi-

sies with which secession had filled the head of that old broken-down man. He was requested to prepare an argument in support of the power to be inserted in the forthcoming message."—[Hon. H. L. Dawes, in the "Boston Congregationalist." See "Atlantic Monthly," XXVI., p. 468.]

* "It was while these plans for a *coup d'état* before the 4th of March were being matured in the very Cabinet itself and in the presence of a President too feeble to resist them and too blind even to see them, that Mr. Stanton was sent for by Mr. Buchanan to answer the question, 'Can a State be coerced?' For two hours he battled and finally scattered for the time being the here-

dent, unable to decide and impotent to construct, seems to have made his message a patchwork from the contributions of his advisers, regular and irregular, with the inevitable effect, not to combine and strengthen, but to weaken and confuse the warring thoughts and alien systems.

Aside from the mere recapitulation of department reports, the message of President Buchanan delivered to Congress on the 4th of December occupied itself mainly with two subjects,—slavery and disunion. On the question of slavery it repeated the assertions and arguments of the Buchanan faction of the Democratic party during the late presidential campaign, charging the present peril entirely upon the North. As a remedy it recommended an amendment to the Federal Constitution expressly* recognizing slavery in States which had adopted or might adopt it, and also expressly giving it existence and protection in the Federal Territories. The proposal was simply childish. Precisely this issue had been decided at the presidential election; to do this would be to reverse the final verdict of the ballot-box.†

On the question of disunion or secession, the message raised a vague and unwarrantable distinction between the infractions of law and allegiance by individuals, and the infractions of law and allegiance by the commonwealth, or body politic denominated a State. Under the

first head it held: That the Union was designed to be perpetual; that the Federal Government is invested with sovereign powers on special subjects, which can only be opposed or abrogated by revolution; that secession is unconstitutional, and is, therefore, neither more nor less than revolution; that the executive has no right to recognize the secession of a State; that the Constitution has established a perfect government in all its forms, legislative, executive, and judicial, and this government, to the extent of its powers, acts directly upon the individual citizen of every State and executes its own decrees by the agency of its own officers; and, finally, that the Executive cannot be absolved from his duty to execute the laws.

But, continues the President, the laws can only be executed in certain prescribed methods, through the agency of courts, marshals, *posse comitatus*, aided, if necessary, by the militia or land and naval forces. The means and agencies, therefore, fail, and the performance of this duty becomes impracticable, when, as in South Carolina, universal public sentiment has deprived him of courts, marshals, and *posse*. Present laws being inadequate to overcome a united opposition, even in a single State, Congress alone has the power to decide whether they can be effectually amended.‡

It will be seen from the above summary, that the whole of the President's rambling

* Slavery existed by virtue of express enactments in the several constitutions of the slave States, but the Constitution of the United States gave it only implied sanction.

† "It was with some surprise, I confess, that I read the message of the President. The message laid down certain conditions as those upon which alone the great Confederacy of the United States could be preserved from disruption. In so doing the President appeared to be preparing beforehand an apology for the secession. Had the conditions, indeed, been such as the Northern States would be likely to accept, the message might have been considered one of peace. But it seems very improbable that the Northern States should now, at the moment of their triumph, and with large majorities of Republicans in their assemblies, submit to conditions which, during many years of struggle, they have rejected or evaded." — [Lord John Russell to Lord Lyons, December 25th, 1860. *British Blue Book*.]

‡ The logic of the message utterly breaks down by a palpable omission to state the well-known fact that, though every citizen of South Carolina, or any other State, might refuse to accept or execute the office of United States marshal, or, indeed, that of any Federal officer, the want could be immediately lawfully supplied by appointing any qualified citizen of any other State, who might lawfully and properly lead either a *posse*, or Federal forces, or State militia, to put down disturbance of the Federal laws, insurrection, or rebellion. President Buchanan admitted his own error, and repudiated his own doctrine, when on January 2d, following, he nominated a citizen of Pennsylvania for the office of collector of the port of Charleston, South Carolina.

But this whole fine-spun web of partisan sophistry is superfluous and mere concealing rubbish. Sections two and three of the Act of February 28th, 1795, authorize the President, when the execution of the laws is obstructed by insurrection too powerful for courts and marshals, to call forth the militia of any and all the States, first and primarily to "suppress such combinations," and, secondly, "to cause the laws to be duly executed; and the use of militia so to be called forth may be continued, if necessary, until the expiration of thirty days after the commencement of the then next session of Congress." In performing this duty the act imposes but a single condition or prerequisite on the Executive: he shall by proclamation command the insurgents to disperse. These sections are complete, harmonious, self-sufficient, and, in their chief provisions, nowise dependent upon or connected with any other section or clause of the act. They place under the President's command the whole militia, and by a subsequent law (March 3d, 1807) also the entire army and navy of the Union, against rebellion. The assertion that the army can only follow a marshal and his writ in a case of rebellion, is not only unsupported by the language of the act, but utterly refuted by strong implication. The last section repeals a former provision limiting the President's action to cases of insurrection of which United States judges shall have given him notice, and thereby remits him to any and all his official sources of information. Jackson's famous force bill only provided certain supplementary details; it directly recognized and invoked the great powers of the Act of 1795, and expiring by limitation, left its wholesome plenitude and broad original grant of authority unimpaired.

discussion of the first head of the disunion question resulted logically in three ultimate conclusions: (1) That South Carolina was in revolt; (2) that the Constitution, the laws, and moral obligation all united gave the Government the right to suppress this revolt by executing the laws upon and against the citizens of that State; (3) that certain defects in the laws paralyzed their practical enforcement.

Up to this point in his argument, his opinions, whatever may be thought of their soundness, were confined to the legitimate field of executive interpretation, and such as in the exercise of his official discretion he might with undoubted propriety communicate to Congress. But he had apparently failed to satisfy his own conscience in thus summarily reasoning the executive and governmental power of a young, compact, vigorous, and thoroughly organized nation of thirty millions of people into sheer nothingness and impotence. How supremely absurd was the whole national panoply of commerce, credit, coinage, treaty power, judiciary, taxation, militia, army and navy, and Federal flag, if, through the mere joint of a defective law, the hollow reed of a secession ordinance could inflict a fatal wound!

The President proceeds, therefore, to discuss the second head of the disunion question, by an attempt to formulate and define the powers and duties of Congress with reference to the threatened rebellion. He would not only roll the burden from his own shoulders upon the national legislature, but he would by volunteer advice instruct that body how it must be borne and disposed of. Addressing Congress, he says in substance:

"You may be called upon to decide the momentous question, whether you possess the power by force of arms to compel a State to remain in the Union. The question, fairly stated, is: Has the Constitution delegated to Congress the power to coerce a State into submission which is attempting to withdraw, or has actually withdrawn, from the Confederacy? If answered in the affirmative, it must be on the principle that the power has been conferred upon Congress to declare and to make war against a State. After much serious reflection I have arrived at the conclusion that no such power has been delegated to Congress, or to any other department of the Federal Government. It may be safely asserted that the power to make war against a State is at variance with the whole spirit and intent of the Constitution. But if we possessed this power, would it be wise to exercise it under existing circumstances? Our Union rests upon public opinion, and can never be cemented by the blood of its citizens shed in civil war. Congress possesses many means of preserving it by conciliation; but the sword was not placed in their hand to preserve it by force."

* "Happily our civil war was undertaken and prosecuted in self-defense, not to coerce a State, but to enforce the execution of the laws within the States against individuals, and to suppress an unjust rebellion raised by a conspiracy among them against the Gov-

Why did the message thus leap at one bound without necessary connection or coherence from the discussion of executive to those of legislative powers? Why waste words over doubtful theories when there was pressing need to suggest practical amendments to the statute whose real or imaginary defects Mr. Buchanan had pointed out? Why indulge in lamentations over the remote possibility that Congress might violate the Constitution, when the occasion demanded only prompt preventive orders from the executive to arrest the actual threatened violation of law by Charleston mobs? Why talk of war against States when the duty of the hour was the exercise of acknowledged authority against insurrectionary citizens?

The issue and argument were wholly false and irrelevant. No State had yet seceded. Execute such laws of the United States as were in acknowledged vigor, and disunion would be impossible. Buchanan needed only to do what he afterward so truthfully asserted Lincoln had done.* But through his inaction, and still more through his declared want of either power or right to act, disunion gained two important points and advantages,—the influence of the executive voice upon public opinion, and especially upon Congress; and the substantial pledge of the Administration that it would lay no straw in the path of peaceful, organized measures to bring about State secession.

The central dogma of the message, that while a State has no right to secede, the Union has no right to coerce, has been universally condemned as a paradox. The popular estimate of Mr. Buchanan's proposition and arguments was forcibly presented at the time by a jesting criticism attributed to Mr. Seward. "I think," said the New York senator, "the President has conclusively proved two things: (1) That no State has the right to secede unless it wishes to; and (2) that it is the President's duty to enforce the laws unless somebody opposes him."† If this be looked upon as the sarcasm of a political enemy, it is even less damaging than the serious explanation put upon his language by his political friends. The recognized organ of the Administration said: "Mr. Buchanan has increased the displeasure of the Lincoln party by his repudiation of the coercion theory, and his firm refusal to permit a resort to force as a means of preventing the secession of a sovereign State."‡ Nor were intelligent lookers-on in

ernment of the United States."—[Buchanan, in "Mr. Buchanan's Administration," p. 129.]

‡ Washington "Constitution" of December 19th, 1860.

foreign lands a whit less severe in their judgment: "Mr. Buchanan's message," said the London "*Times*," a month later, "has been a greater blow to the American people than all the rants of the Georgian governor or the 'ordinances' of the Charleston convention. The President has dissipated the idea that the States which elected him constitute one people."

THE CONSPIRACY PROCLAIMED.

To a great majority of the people the hopes and chances of a successful compromise seemed still cheering and propitious. There was indeed a prevailing agitation in the Southern part of the Union, but it had taken a virulent form in less than half a dozen States. In most of these a decided majority still deprecated disunion. Three of the great political parties of the country were by the voice of their leaders pledged to peace and order; the fourth, apparently controlled as yet by the powerful influences of official subordination and patronage, must, so it seemed, yield to the now expressed and public advice of the President in favor of Union and the enforcement of the law; especially in view of the forbearance and kindness he was personally exercising toward the unruly elements of his faction. Throughout the Northern States the folly and evils of disunion appeared so palpable, that it was not generally regarded as an imminent danger, but rather as merely a possible though not probable event. The hasty and seemingly earnest action of the people and authorities of South Carolina was looked upon as a historical repetition of the nullification crisis of 1831-2; and without examining too closely the real present condition of affairs, men hoped, rather than intelligently expected, that the parallel would continue to the end. Some sort of compromise of the nature of that of 1850 was the prevailing preoccupation in politics.

This was the popular view of the situation. But it was a very narrow and erroneous view, because it lacked the essential information necessary to form a correct and solid judgment. The deep estrangement between the sections was imperfectly realized. The existence of four parties, a very unusual occurrence in American politics, had seriously weakened party cohesion, and more than quadrupled party prejudice and mistrust. There was a strong undercurrent of conviction and purpose, not expressed in speeches and platforms. But the most serious ignorance was in respect to the character and fidelity of the high officers of the government. Of the personal timidity of Mr. Buchanan, of the treachery of at least three members of the Cabinet, of the exclusion of General Scott from

military councils, of the President's persistent refusal to send troops to Anderson, of his stipulation with the South Carolina members, of the intrigue which drove General Cass from the head of the State Department and from the Cabinet, the people at large knew nothing, or so little that they could put no intelligent construction upon the event. The debates of Congress shed the first clear light upon the situation, but the very violence and bitterness of the secession speeches caused the multitude to doubt their sincerity and truthfulness, or, as a final probability, placed their authors in the category of fanatics who would gain no followers.

While, therefore, the Republicans in Congress and in the country maintained, as a rule, an expectant and watchful silence, the conservatives, made up for the greater part of the supporters of Bell and Everett, were active in setting on foot a movement for compromise, in the final success of which they had the fullest confidence; and it is but justice to their integrity and ability to add that this confidence was fully warranted by the delusive indications of surface politics. Highly patriotic in sentiment and purpose and highly prudent in word and act, their leading men in Congress had promptly opposed secession, had moved a Senate Committee of Thirteen, and secured the authorization, the appointment, and the organization of a House Committee of Thirty-three. Already had some twenty-three different propositions of adjustment been submitted to this committee, and under the circumstances it actually seemed as if only a little patience and patriotic earnestness were needed to find a compromise,—perhaps an amendment of the Constitution which the feverish unrest and impatience of the nation would compel Congress to enact or propose, and the different States and sections, willing or unwilling, to accept and ratify.

Superior political wisdom and more thorough information, as well as a finer strategy, a quicker enthusiasm, a more absolute devotion, and a more unremitting industry, must be freely accorded to the conspirators who now labored night and day in the interest of disunion. They counted more clearly than their opponents the demoralization of parties at the North, the latent revolutionary discontent at the South, the potent influence of brilliant and combined leadership, and the social, commercial, and political conditions which might be brought into present and ultimate action. They recognized that they were but a minority, a faction; but they also realized that as such they had a substantial control of from six to eleven States whenever they chose to make that control effective, and that, for present uses

at least, the President was, under their influence, but as clay in the hands of the potter.

Better than the Republicans from the North, or even the conservatives from the border States, they knew that in the cotton-States a widespread change of popular sentiment was then being wrought and might very soon be complete. Except upon the extreme alternative of disunion, the people of the border States were eager to espouse their quarrel, and join them in a contest for alleged political rights. Nearly half the people of the North were ready to acknowledge the existence and justness of their formulated complaints. The election of Lincoln was indeed a flimsy and specious pretext for separation, but it had the merit of universal publicity, and of rankling irritation among the unthinking masses. Agriculture was depressed, commerce was in panic, manufacturing populations were in want, the national treasury was empty, the army was dispersed, the fleet was scattered. The national prestige was humbled, the national sentiment despondent, the national faith disturbed.

Meanwhile their intrigues had been successful beyond hope. The Government was publicly committed to the fatal doctrine of non-coercion, and was secretly pursuing the equally fatal policy of concession. Reinforcements had been withheld from Charleston and must from motives of consistency be withheld from all other forts and stations. An unofficial stipulation, with the President, and a peremptory order to Anderson, secured beyond chance the safe and early secession of South Carolina, and the easy seizure of the Government property and forts at Charleston. The representatives of foreign governments were already secretly coquetting for the favor of a free port and an advantageous cotton-market. Friendly voices came to the South from the North, in private correspondence, in the public press, even in the open debates of Congress, promising that cities should go up in flames and the fair country be laid waste ere a single Northern bayonet should molest them in their meditated secession.

Upon such a real or assumed state of facts the conspirators based their theory, and risked their chances of success in dismembering the republic,—and it must be admitted that they chose their opportunity with a skill and foresight which for a considerable period of time gave them immense advantages over the friends of the Union. One vital condition of success, however, they strangely overlooked, or rather, perhaps, deliberately crowded out of their problem,—the chance of civil war, without foreign intervention. For the present their whole plan depended upon the assumption that they could accomplish their end by means of the

single instrumentality of peaceable secession; and with this view they proceeded to put their scheme into prompt execution.

The House Committee of Thirty-three had been organized by the selection of Thomas Corwin as its chairman, and had entered hopefully upon the task confided to it. An angry and excited caucus of active conspirators was said to have been held the week previous, to intimidate the members from the cotton-States and induce them to refuse to serve on the committee, but this coercive movement only partly succeeded. The committee held a long meeting on December 12th, and now on the morning of the 13th was once more convened for work. The informal propositions and discussions of the day previous were renewed, but resulted only in calling out views and schemes too vague on the one hand or too extreme on the other. The subject was about to be laid over to the following Saturday, when Mr. Rust of Arkansas startled the committee with the information that the extremists were obtaining signatures to a paper to announce to the South that no further concession was expected from the North, and that any adjustment of pending difficulties had become impossible. He therefore offered a resolution to meet this unexpected crisis, but accepted the following substitute, offered by Mr. Dunn of Indiana :

“Resolved, That in the opinion of this committee, the existing discontent among the Southern people and the growing hostility among them to the Federal Government are greatly to be regretted, and that whether such discontent and hostility are without just cause or not, any reasonable, proper, and constitutional remedies and effectual guarantees of their peculiar rights and interests, as recognized by the Constitution, necessary to preserve the peace of the country and the perpetuation of the Union, should be promptly and cheerfully granted.”

Other amendments were voted down, and this proposition was adopted by a vote of 22 to 8; and thus in good faith a tender of reasonable concession and honorable and satisfactory compromise was made by the North to the South. But the peace-offering was a waste of patience and good-will. Caucus after caucus of the secession leaders had only grown more aggressive, and deepened and strengthened their inflexible purpose to push the country into disunion. Keeping themselves thoroughly informed of every political intrigue and every official movement, they timed their own decisions and demonstrations with a fatal promptness and precision. The presence of General Scott, who after a long illness had come from New York to Washington, on December 12th, to give his urgent advice to the work of counteracting secession by vigorous military preparation, did not in the least disconcert or

hinder the secession leaders. His patriotic appeal to the Secretary of War * on the 13th naturally fell without effect upon the ears of one of their active confederates.

This vital issue once decided, the revolutionists did not lose or delay a single moment in taking their next step forward. Neither the temporizing concession of the President nor the conciliatory and half-apologetic resolution of the Committee of Thirty-three for one instant changed or affected their determination to destroy the Government and dissolve the Union.

Friday, December 14th, 1860, was a day of gloom and despondency in Mr. Buchanan's office, bringing to his mind more forcibly than he had ever before realized the utter shipwreck into which he had guided his Administration. To the jubilant secessionists, on the other hand, it was not only a day of perilous triumph achieved, but also of apparently assured successes yet to come. The hitherto official organ of the Administration in its issue of the following morning contained two publications which gave startling notice to the country of the weakness of the right and the strength of the wrong in the swiftly forming struggle for national existence.

The first of these documents was a proclamation from the President of the United States, stating that in response to numerous appeals he designated the fourth day of January, proximo, as a day of humiliation, fasting, and prayer. The "dangerous and distracted condition of our country" was therein thus set forth:

"The Union of the States is at the present moment threatened with alarming and immediate danger—panic and distress of a fearful character prevail throughout the land—our laboring population are without employment, and consequently deprived of the means of earning their bread—indeed, hope seems to have deserted the minds of men. All classes are in a state of confusion and dismay, and the wisest counsels of our best and purest men are wholly disregarded. . . . Humbling ourselves before the Most High, . . . let us implore him to remove from our hearts that false pride of opinion which would impel us to persevere in wrong for the sake of consistency, rather than yield a just submission to the unforeseen exigencies by which we are now surrounded. . . . An omnipotent Providence may overrule existing evils for permanent good."

The second manifesto was more practical, more pertinent, more resolute. As the first public and combined action of the conspirators, it forms the hinge upon which they well-nigh turned the fate of the New World Republic. It was a brief document, but contained and expressed all the essential purpose of the conspiracy. It was signed by about one-half the

senators and representatives of the States of North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Florida, Texas, and Arkansas. It precedes every ordinance of secession, and is the "official" beginning of the subsequent "Confederate States," just as Governor Gist's October circular was the "official" beginning of South Carolina secession.

ADDRESS OF CERTAIN SOUTHERN MEMBERS OF CONGRESS.

TO OUR CONSTITUENTS.

WASHINGTON, December 14th, 1860.

The argument is exhausted. All hope of relief in the Union through the agency of committees, congressional legislation, or constitutional amendments is extinguished, and we trust the South will not be deceived by appearances or the pretense of new guarantees. In our judgment the Republicans are resolute in the purpose to grant nothing that will or ought to satisfy the South. We are satisfied the honor, safety, and independence of the Southern people require the organization of a Southern Confederacy—a result to be obtained only by separate State secession—that the primary object of each slaveholding State ought to be its speedy and absolute separation from a Union with hostile States.

Instead of the argument being exhausted, it was scarcely begun. So far from congressional or constitutional relief having been refused, the Southern demand for them had not been formulated. Not only had no committee denied hearing or action, but the Democratic Senate, at the instance of a Southern State, had ordered the Committee of Thirteen, which the Democratic and Southern Vice-President had not yet even appointed; and when the names were announced a week later, Jefferson Davis, one of the signers of this complaint of non-

* "Scott Auto." Vol. II., p. 613.

† Washington "Constitution," Dec. 15th, 1860.

action, was the only man who refused to serve on the committee—a refusal he withdrew when persuaded by his co-conspirators that he could better aid their designs by accepting. On the other hand, the Committee of Thirty-three, raised by the Republican House, appointed by a Northern Speaker, and presided over by a Northern chairman, had the day before by more than a two-thirds vote distinctly tendered the Southern people “any reasonable, proper, and constitutional remedies and effectual guarantees.”

Outside of congressional circles there was the same absence of any new complications, any new threats, any new dangers from the North. Since the day when Abraham Lincoln was elected President there had been absolutely no change of word or act in the attitude or intention of himself or his followers. By no possibility could they exert a particle of adverse political power, executive, legislative, or judicial, for nearly three months to come. Not only was executive authority in the hands of a Democratic Administration, which had made itself the peculiar champion of the Southern party, but it had yielded every successive demand of administrative policy made by the conspirators themselves. The signers of this address to their Southern constituents had not one single excuse. Their proclamation was a falsehood; but nothing less would serve their new step in conspiracy.

SOUTH CAROLINA SECESSION.

THE secret circular of Governor Gist of South Carolina, heretofore quoted, inaugurated the great American Rebellion a full month before a single ballot had been cast for Abraham Lincoln. This was but repeating in a bolder form the action taken by Governor Wise of Virginia, during the Frémont campaign four years before. But, instead, as in that case, of confining himself to a proposed consultation among slave-State executives, Governor Gist proceeded almost immediately to a public and official revolutionary act.

On the 12th of October, 1860, he issued his proclamation convening the Legislature of South Carolina in extra session, “to appoint electors of President and Vice-President. . . . and also that they may, if advisable, take action for the safety and protection of the State.” There was no external peril menacing either the commonwealth or its humblest citizen; but the significance of the phrase was soon developed.

A large caucus of prominent South Carolina leaders was held on the 25th of October at the residence of Senator Hammond. Their deliberations remained secret, but the deter-

mination arrived at appears clearly enough in the further official action of Governor Gist, who was present, and who doubtless carried out the plans of the assemblage. When the legislature met on November 5th (the day before the presidential election) the governor sent them his opening message, advocating both secession and insurrection, in direct and undisguised language. He recommended that in the event of Lincoln's election, a convention should be immediately called; that the State should secede from the Federal Union; and “if in the exercise of arbitrary power and forgetful of the lessons of history, the Government of the United States should attempt coercion, it will be our solemn duty to meet force by force.” To this end he recommended a reorganization of the militia and the raising and drilling an army of ten thousand volunteers. He placed the prospects of such a revolution in a hopeful light. “The indications from many of the Southern States,” said he, “justify the conclusion that the secession of South Carolina will be immediately followed, if not adopted simultaneously, by them, and ultimately by the entire South. The long-desired coöperation of the other States having similar institutions, for which so many of our citizens have been waiting, seems to be near at hand; and, if we are true to ourselves, will soon be realized.”*

The legislature, remaining in extra session, and cheered and urged on by repeated popular demonstrations and the inflamed speeches of the highest State officials, proceeded without delay to carry out the governor's programme.

The first day's session of the legislature (November 5th) developed one of the most important preparatory steps of the long-expected revolution. The legislature of 1859 had appropriated a military contingent fund of \$100,000 “to be drawn and accounted for as directed by the Legislature.” The appropriation had been allowed to remain untouched. It was now proposed to place this sum at the control of the governor to be expended in obtaining improved small arms, in purchasing a field battery of rifled cannon, in providing accouterments, and in furnishing an additional supply of tents; and a resolution to that effect duly passed two days later.† The chief measure of the session, however, was a bill to provide for calling the proposed State convention, which, it was well understood, should adopt an ordinance of secession.

The delegates to the convention were duly

* Governor Gist's Message, Nov. 5th, 1860. “S. C. House Journal,” pp. 10, 11.

† “S. C. House Journal,” pp. 13, 14.

elected on the 6th of December, and assembled and organized at Columbia, the capital of the State, on the 17th of the same month; on account of a local epidemic, however, both the convention and the legislature adjourned to Charleston, where the former reassembled on the following day and the latter two days afterwards. Elected under the prevailing secession *fervor*, which tolerated no opposition, and embracing the leading conspirators in its membership, the convention was practically unanimous. "There is no honor," said the chairman on taking his seat, "I esteem more highly than to sign the ordinance of secession as a member of this body: but I will regard it as the greatest honor of my life to sign it as your presiding officer."*

The legislature of South Carolina had also just elected a new governor, who was inaugurated on the same day on which the convention met. This was F. W. Pickens, a revolutionist of a yet more radical and energetic type than his predecessor Gist, and who, as we have seen, had been in close consultation with the Cabinet cabal at Washington, more than a month before. He was, of course, anxious to signalize his advent; and to this end he immediately dispatched to Washington a special messenger, bearing the following letter to President Buchanan:

* (Strictly confidential.)

COLUMBIA, December 17th, 1860.

"MY DEAR SIR: With a sincere desire to prevent a collision of force, I have thought proper to address you directly and truthfully on points of deep and immediate interest.

"I am authentically informed that the forts in Charleston Harbor are now being thoroughly prepared to turn, with effect, their guns upon the interior and the city. Jurisdiction was ceded by this State expressly for the purpose of external defense from foreign invasion, and not with any view that they should be turned upon the State.

"In an ordinary case of mob rebellion, perhaps it might be proper to prepare them for sudden outbreak. But when the people of the State, in sovereign convention assembled, determine to resume their original powers of separate and independent sovereignty, the whole question is changed, and it is no longer an act of rebellion. I, therefore, most respectfully urge that all work on the forts be put a stop to for the present, and that no more force may be ordered there.

"The regular convention of the people of the State of South Carolina, legally and properly called, under our Constitution, is now in session, deliberating upon the gravest and most momentous questions, and the excitement of the great masses is great, under a sense of deep wrong, and a profound necessity of doing something to preserve the peace and safety of the State.

"To spare the effusion of blood, which no human

power may be able to prevent, I earnestly beg your immediate consideration of all the points I call your attention to. It is not improbable that, under orders from the Commandant, or perhaps from the Commander-in-Chief of the Army, the alteration and defenses of these posts are progressing without the knowledge of yourself or the Secretary of War.

"The arsenal, in the city of Charleston, with the public arms, I am informed, was turned over very properly to the keeping and defense of a State force, at the urgent request of the governor of South Carolina. I would most respectfully, and from a sincere devotion to the public peace, request that you would allow me to send a small force, not exceeding twenty-five men and an officer, to take possession of Fort Sumter, immediately, in order to give a feeling of safety to the community. There are no United States troops in that fort whatever, or perhaps only four or five, at present; besides some additional workmen or laborers, lately employed to put the guns in order. If Fort Sumter could be given to me, as governor, under a permission similar to that by which the governor was permitted to keep the arsenal, with the United States arms in the city of Charleston, then I think the public mind would be quieted under a feeling of safety; and as the convention is now in full authority, it strikes me that could be done with perfect propriety. I need not go into particulars, for urgent reasons will force themselves readily upon your consideration.

"If something of the kind be not done, I cannot answer for the consequences.

"I send this by a private and confidential gentleman, who is authorized to confer with Mr. Trescott fully, and to receive through him any answer you may think proper to give to this.

"I have the honor to be, most respectfully,

"Yours truly, F. W. PICKENS.

"To the President of the United States."†

Arrived in Washington, the special messenger who bore this document sought the active agent‡ of the central cabal, Mr. Trescott, Assistant Secretary of State, and was by him on Thursday morning, December 20th, conducted to the White House and presented to Mr. Buchanan, to whom he personally delivered his communication. The President received the document and promised an answer to it on the following day.§ The temper and condition of his mind is plainly reflected in what he wrote. He seems to have realized no offense in this insult to the sovereignty and dignity of the United States whose Constitution he had sworn to "preserve, protect, and defend"; no patriotic resentment against the South Carolina conspirators who, as he knew by the telegraph, were assembling that same day in convention to inaugurate local rebellion;—his whole answer breathes a tone of apology that his oath and duties will not permit him to oblige the South Carolina governor; and he feebly gropes for relief from his perplexities in the suggestion

citizen, appointed, as I have since been informed by my predecessor, to remain at Washington as confidential representative of the State."—"South Carolina House Journal," 1861, p. 31.

§ Curtis's "Life of Buchanan," President's memorandum, p. 383.

* "Convention Journal," p. 10.

† Pickens to Buchanan, December 17th, 1860. "S. C. House Journal," 1861, p. 167.

‡ In his message of November 5th, 1861, Governor Pickens of South Carolina refers to William H. Trescott, Esq., who was in December, 1860, Assistant Secretary of State at Washington, as "a distinguished

that Congress might perhaps somehow arrange the trouble. This was the answer prepared :

"WASHINGTON, December 20th, 1860.

"MY DEAR SIR: I have received your favor of the 17th inst. by Mr. Hamilton. From it I deeply regret to observe that you seem entirely to have misapprehended my position, which I supposed had been clearly stated in my message. I have incurred, and shall incur, any reasonable risk within the clearly prescribed line of my executive duties to prevent a collision between the army and navy of the United States and the citizens of South Carolina in defense of the forts within the harbor of Charleston. Hence I have declined for the present to reënforce these forts, relying upon the honor of South Carolinians that they will not be assaulted whilst they remain in their present condition; but that commissioners will be sent by the convention to treat with Congress on the subject. I say with Congress because, as I state in my message, 'Apart from the execution of the laws so far as this may be practicable, the Executive has no authority to decide what shall be the relations between the Federal Government and South Carolina. He has been invested with no such discretion. He possesses no power to change the relations heretofore existing between them, much less to acknowledge the independence of that State.' This would be to invest a mere executive officer with the power of recognizing the dissolution of the confederacy among our thirty-three sovereign States. It bears no resemblance to the recognition of a foreign *de facto* government, involving no such responsibility. Any attempt to do this would, on my part, be a naked act of usurpation.

"As an executive officer of the Government, I have no power to surrender to any human authority Fort Sumter, or any of the other forts or public property in South Carolina. To do this would, on my part, as I have already said, be a naked act of usurpation. It is for Congress to decide this question, and for me to preserve the status of the public property as I found it at the commencement of the troubles.

"If South Carolina should attack any of these forts, she will then become the assailant in a war against the United States. It will not then be a question of coercing a State to remain in the Union, to which I am utterly opposed, as my message proves, but it will be a question of voluntarily precipitating a conflict of arms on her part, without even consulting the only authority which possesses the power to act upon the subject. Between independent governments, if one possesses a fortress within the limits of another, and the latter should seize it without calling upon the appropriate authorities of the power in possession to surrender it, this would not only be a just cause of war, but the actual commencement of hostilities.

"No authority was given, as you suppose, from myself or from the War Department, to Governor Gist, to guard the United States Arsenal in Charleston by a company of South Carolina volunteers. In this respect you have been misinformed — I have, therefore, never been more astonished in my life, than to learn from you that unless Fort Sumter be delivered into your hands, you cannot be answerable for the consequences." *

It is easy to infer from results, that while the President was laboring over this document the central cabal was busy. They saw that the rash zeal of Governor Pickens was endangering the fine web of conspiracy they had wound around

him. He was committed to non-coercion; committed to non-reënforcements; committed to await the arrival of South Carolina commissioners. This new demand from a new authority not only indicated a division of sentiment and purpose in the insurrectionary councils in the Palmetto State, but created an opportunity through which Mr. Buchanan under a possible healthier impulse of patriotism might repudiate the whole obligation of non-resistance to their schemes into which they had beguiled him. They clearly saw, as they themselves explained, that though he would not deliver Sumter now, he might be willing to "approach such action" hereafter, "a possibility not at all improbable, and which ought to be kept open."† Mr. Trescott therefore hastened to take the advice of two of the South Carolina congressmen,—McQueen and Bonham,—and it is not a violent presumption to assume also of the chief senatorial conspirators; for only six days had elapsed since the congressional circular was signed and published, which called upon the cotton-States to proceed with the plot of secession and the formation of a Southern confederacy. A telegram was at once sent to Charleston, mildly explaining to Governor Pickens the blunder he was making and asking his authority to withdraw his letter to Mr. Buchanan. Governor Pickens must be credited with astuteness enough to comprehend the situation, for he at once gave the consent requested. On Friday morning Mr. Trescott waited upon Mr. Buchanan and informed him that he would not be required to answer, but that Governor Pickens had withdrawn his demand; and Mr. Trescott records, with an evident appreciation of the whole affair as a successful stroke of policy, that "the withdrawal of the letter was a great relief to the President." To understand more fully the whole scope and spirit of the incident, we must read the report of it which he then transmitted to Charleston :

"TO HIS EXCELLENCY F. W. PICKENS,
GOVERNOR OF SOUTH CAROLINA:

"WASHINGTON, December 21st, 1860.

"SIR: Your confidential letter to the President was duly delivered to him yesterday by D. H. Hamilton, Esq., according to your instructions. It was withdrawn (no copy having been taken) this morning by me, under the authority of your telegraphic dispatch. Its withdrawal was most opportune. It reached here under circumstances which you could not have anticipated, and it produced the — effect upon the President.

"He had removed Colonel Gardiner from command at Fort Moultrie, for carrying ammunition from the arsenal at Charleston; he had refused to send reënforcements to the garrison there; he had accepted the resignation of the oldest, most eminent, and highest member of his Cabinet, rather than consent to send additional force, and the night before your letter arrived, he, upon a telegraphic communication that arms had been removed from the arsenal to Fort Moultrie, the Department of War had issued prompt orders by

* Curtis's "Life of Buchanan," Vol. II., p. 384.

† Trescott to Pickens. "South Carolina House Journal," 1861, p. 170.

telegraph to the officer removing them," to restore them immediately. He had done this upon his determination to avoid all risk of collision, and upon the written assurance of the majority of the Congressional Delegation from the State that they did not believe there was any danger of an attack upon the forts be-

peated to labor under the impression that the representation of the members of Congress and your own differed essentially, and this, I thought, on account of both, should not be stated in any reply to you. I was also perfectly satisfied that the status of the garrisons would not be disturbed.

"Under these circumstances, if I had been acting under formal credentials from you, and the letter had been unsealed, I would have delayed its presentation for some hours, until I could have telegraphed you, but that was impossible. As Mr. Hamilton, therefore, had brought with him General McQueen and General Bonham, when he called on me and delivered the letter, and had even gone so far as to express the wish that they should be present when he delivered it to the President—a proposition which they declined, however—I deemed it not indiscreet, nor in violation of the discretionary confidence which your letter implied, to take their counsel. We agreed perfectly, and the result was the telegraphic dispatch of last night. The withdrawal of the letter was a great relief to the President, who is most earnestly anxious to avoid an issue with the State or its authorities, and I think, has encouraged his disposition to go as far as he can in this matter, and to treat those who may represent the State with perfect frankness.

"I have had this morning an interview with Governor Floyd, the Secretary of War. No order has been issued that will at all disturb the present condition of the garrisons, and while I cannot even here venture into details, which are too confidential to be risked in any way, I am prepared to say, with a full sense of the responsibility, that nothing will be done which will either do you injury or properly create alarm. Of course when your commissioners have succeeded or failed to effect their negotiations, the whole issue is fairly before you, to be met as courage, honor, and wisdom may direct.

"My delay in answering your telegraph concerning Colonel Huger, was caused by his absence from this place. He came, in reply to my telegraph last night, and this morning I telegraphed, upon his decision, which I presume he has explained by a letter of this same date. As Dr. Hamilton leaves this evening, I have only time to write this hurried letter, and am, sir,

"Very respectfully,

"WM. HENRY TRESCOTT.†

"I inclose your confidential letter in this."‡

We must now turn our attention from the executive rooms of the presidential mansion in Washington to the executive rooms of South Carolina in Charleston, where on the same day a feeble counterpart of the transaction we have described was going on. Since the beginning of these new troubles, especially since the dis-

fore the passage of the Ordinance, and an expression of their trust and hope that there would be none after, until the State had sent commissioners here. His course had been violently denounced by the Northern press, and an effort was being made to—a Congressional investigation. At that moment he could not have gone to the extent of action you desired and I felt confident that if forced to answer your letter then he would have taken such ground as would have prevented his ever approaching it hereafter, a possibility not at all improbable, and which ought to be kept open. I considered, also, that the chance of public investigation rendered the utmost caution necessary as to any communications from the State, and having presented the letter, and ascertained what the nature of the reply would be, you had all the advantage of knowing the truth, without the disadvantage of having it put on record. Besides this, the President seemed to think that your request was based upon the impossibility of your restraining the spirit of our people; an interpretation which did you injustice, and the possibility of which I deemed it due to you to avoid. He also ap-

* The blanks and the awkward rhetorical construction are copied exactly as the authors find them printed in the "South Carolina House Journal."

† Trescott to Pickens, December 21st, 1860. "S. C. House Journal," 1861, pp. 169-171.

‡ In Mr. Curtis's "Life of Buchanan," Vol. II., p. 383, will be found the private memorandum of President Buchanan giving his statement of the incident:

"On Thursday morning, December 20th, 1860, Hamilton, late marshal of South Carolina, sent especially for this purpose, presented me a letter from Governor Pickens, in the presence of Mr. Trescott, dated at Columbia, South Carolina, 17th December (Monday). He was to wait till this day (Friday afternoon) for my answer. The character of the letter will appear from the answer to it which I had prepared. Thursday night, between 9 and 10 o'clock, Mr. Trescott called upon me. He said that he had seen Messrs. Bonham and

McQueen of the South Carolina delegation, that they all agreed that this letter of Governor Pickens was in violation of the pledge which had been given by themselves not to make an assault upon the forts, but to leave them in *statu quo* until the result of an application of commissioners to be appointed by the State was known; that Pickens, at Columbia, could not have known of the arrangements. They—to wit, Bonham, McQueen, and Trescott—had telegraphed to Pickens for authority to withdraw his letter. Friday morning, 10 o'clock, 21st December, Mr. Trescott called upon me with a telegram of which the following is a copy from that which he delivered to me: 'December 21st, 1860.—You are authorized and requested to withdraw my letter sent by Dr. Hamilton immediately. F. W. P.' Mr. Trescott read to me, from the same telegram, that Governor Pickens had seen Mr. Cushing; the letter was accordingly written."

cussion and issuing of his message, President Buchanan felt anxious and ill at ease. He could not shut his eyes to the fact that in South Carolina at least a tide of revolution was steadily rising. He appears to have dimly felt that his official responsibility and honor were somehow involved; and since he had reasoned the executive power into nothingness, the idea suggested itself to his mind that a little friendly expostulation at least was due from him. Under some such impulse he wrote the following letter to Governor Pickens, and with it dispatched the Hon. Caleb Cushing to Charleston, to see if he might not exert a personal influence upon the malcontents, who paid no heed to any wishes or interests but their own:

"WASHINGTON, December 18th, 1860.

"MY DEAR SIR: From common notoriety, I assume the fact that the State of South Carolina is now deliberating on the question of seceding from the Union. Whilst any hope remains that this may be prevented, or even retarded, so long as to allow the people of her

POSTMASTER-GENERAL JOSEPH HOLT.
(FROM A PHOTOGRAPH BY BRADY.)

sister States an opportunity to manifest their opinions upon the causes which have led to this proceeding, it is my duty to exert all the means in my power to avert so dread a catastrophe. I have, therefore, deemed it advisable to send to you the Hon. Caleb Cushing, in whose integrity, ability, and prudence I have full confidence, to hold communications with you on my behalf, for the purpose of changing or modifying the contemplated action of the State in the manner I have already suggested. Commending Mr. Cushing to your kind attention, for his own sake, as well as that of the cause, I remain,

"Very respectfully, your friend,

"JAMES BUCHANAN.

"HIS EXCELLENCY FRANCIS W. PICKENS."*

Mr. Cushing was a man of great affability, and of prominence in the Democratic party. He had been Attorney-General under President Pierce, and was called to preside over

the Charleston convention, until the dissension in that body between Northern and Southern Democrats caused its disruption and adjournment to Baltimore. In the second disruption at Baltimore, Mr. Cushing had followed the fortunes of the Southern leaders, and with them had seceded, and presided over that fraction of the original body which nominated Breckinridge. Though a Massachusetts man, he was thus affiliated in party principle, party organization, and party action with the South, and President Buchanan not unnaturally thought that he was a proper personal agent, and ought to be an influential party representative, capable, in behalf of the Administration, of dissuading the Charleston conspirators from their dangerous determination, or at least from their reckless precipitancy.

But the sequel shows that Buchanan both misunderstood the men he had to deal with, and was unequal in purpose or will to cope with their superior daring and resolution.

Mr. Cushing arrived in Charleston on the day the South Carolina convention passed its ordinance of secession. He obtained an interview with Governor Pickens, and presented the President's letter. "I had but a short interview with him," says Governor Pickens in his message of November 5th, 1861, "and told him I would return no reply to the President's letter, except to say very candidly that there was no hope for the Union, and that, so far as I was concerned, I intended to maintain the separate independence of South Carolina, and from this purpose neither temptation nor danger should for a moment deter me." There is a notable contrast in this haughty and defiant reception by a South Carolina governor of the messenger of the President of the United States, to the cringing and apologetic spirit in which the President had on that same morning received the messenger of the governor and replied to his demand. Mr. Cushing's reply deserves special notice. "He said," continues Governor Pickens, "that he could not say what changes circumstances might produce, but when he left Washington there was then no intention whatever to change the status of the forts in our harbor in any way." By this language Mr. Cushing himself seems to have changed his errand from a patriotic mission of protest and warning to one conveying hopeful and advantageous information to the conspirators.

It could hardly have been without a sense of personal mortification to Mr. Cushing that the drama which he had been sent to avert, or at least to postpone, immediately unrolled itself under his very eyes, and his mortification must have risen to indignation when he was requested by his presence to grace the pageant. The South Carolina convention, during the

* Buchanan to Pickens, December 18th, 1860. "S. C. House Journal," 1861, p. 171.

two days which had elapsed since its adjournment hither from Columbia, had been deliberating in secret session. A little after midday of December 20th, the streets of Charleston were filled with the following placards, giving the public the first notice of its action:

CHARLESTON MERCURY EXTRA:

Passed unanimously at 1.15 o'clock, P. M., December 20th, 1860.

AN ORDINANCE

To dissolve the Union between the State of South Carolina and other States united with her under the compact entitled "The Constitution of the United States of America."

We, the People of the State of South Carolina, in Convention assembled, do declare and ordain, and it is hereby declared and ordained,

That the Ordinance adopted by us in Convention, on the twenty-third day of May, in the year of our Lord one thousand eight hundred and eighty-eight, whereby the Constitution of the United States of America was ratified, and also, all Acts and parts of Acts of the General Assembly of this State, ratifying amendments of the said Constitution are hereby repealed, and that the same now subsisting between South Carolina and other States, under the name of "The United States of America," is hereby dissolved.

THE UNION IS DISSOLVED!

The usual jubilations immediately followed, — ringing of bells, salutes of cannon, and the noise and display of street parades. The convention resolved to celebrate the event further by a public ceremonial to which it invited the governor, the legislature, and other dignitaries; and both branches of the legislature also sent a committee to Caleb Cushing to give him an official invitation to attend. At half-past 6 that evening the members of the convention marched in procession to Institute Hall, where the public signing of the ordinance of secession was performed with appropriate solemnities,

ATTORNEY-GENERAL JEREMIAH S. BLACK.
(FROM A PHOTOGRAPH BY BRADY.)

ties, and at its close the President announced: "The ordinance of secession has been signed and ratified, and I proclaim the State of South Carolina an Independent Commonwealth."

The city and the State joined in general exultation as if a great work had been accomplished, as if the efforts of a generation had been crowned with fulfillment, and nothing remained but to rest and enjoy the ripened fruit of independence. There seemed to be no dream, amid all this rejoicing, that nothing definite had as yet been effected; that the reckless day's act was but the prelude to the most terrible tragedy of the age, the unchaining of a storm which should shake the continent with terror and devastation, leaving every Southern State a wreck, and sweeping from the face of the earth the institution in whose behalf the fatal work was done.

The secession ordinance having been passed, signed, and proclaimed, the convention busied itself for the next few days in making up a public statement of its reasons for the anomalous procedure. The discussion showed a wide divergence of opinion as to the causes which had produced the act. One ascribed it to the election of Lincoln, another to the failure of the Northern States to execute the fugitive-slave law, a third to the antislavery sentiment of the free States, a fourth to the tariff, a fifth to unconstitutional appropriations by Congress, and so on. On the 24th of December the convention adopted a "Declaration of Causes," and an "Address to the Slaveholding States," the two papers together em-

bracing the above and other specifications. Since neither the Constitution of the United States nor the laws of Congress contained any section, clause, word, or reasonable implication that authorized an act of secession, the "Declaration of Causes" formulated the doctrine of State-rights in justification. That doctrine in substance was, that the several States entered the Union as sovereignties; that in forming the Federal Government they delegated to it only specific powers for specific ends; that the Federal Government was not a sovereign over sovereignties, but was only an agent between them; that there existed no common arbiter to adjudge differences; that each State or sovereignty might judge for itself any violation of the common agreement and choose its own mode of redress; consequently that each State might adhere to or secede from the Union, at its own sovereign will and pleasure.

This doctrine, springing from early differences of constitutional interpretation, had not been promulgated in its ultra form until South Carolina's nullification movement in 1832. It had been accepted and sustained by only a small fraction of the American people. The whole current, action, and development of the government of the United States under the Constitution was based upon the opposite theory. Washington and the succeeding Presidents rejected it in their practical administration; Marshall and the Supreme Court condemned it in their judicial decisions; Webster refuted it in his highest constitutional arguments; Congress repudiated it in its legislation; Jackson denounced it in executive proclamation as treasonable and revolutionary; and the people of the Union at large regarded it as an absurd and dangerous political heresy.

CHARLESTON HARBOR.

WE have sketched the positions assumed by President Buchanan upon the political theories

MAJOR ROBERT ANDERSON. (FROM A PHOTOGRAPH BY BRADY.)

involved in the secession movement, as well as the contradictory policy he proposed to pursue in dealing with it. In addition, it becomes necessary to state briefly the practical action so far taken by him, especially in regard to the forts in Charleston Harbor, the possession of which was so earnestly desired by the leaders of rebellion in South Carolina. To secede, to declare their political independence without power to control their harbors and regulate their commerce, would be an absurdity calculated to draw upon them only the ridicule of foreign powers. The possession of the Federal forts, therefore, far exceeded in importance even their ordinance of secession, and had engaged a much earlier and deeper solicitude on their part. These forts were three in number. Look

at any good map of Charleston Harbor, and it will be seen that the city lies on the extreme point of a tongue of land between the Ashley and Cooper rivers, every part being within easy range under the guns of Castle Pinckney, which stands on a small island, three-quarters of a mile distant. Four miles to seaward is the mouth of the harbor, and nearly midway therein stands the more extensive and imposing work of Fort Sumter, its guns not only sweeping all the approaches and ship-channels, but the shores and islands on either hand. It needs but a glance at the map to see that, with proper garrisons and armaments, Fort Sumter commands the harbor, and Castle Pinckney commands the city, in the absence of very formidable preparations for attack.

Owing to the long period of peace through which the country had passed, these works were in a neglected condition, and only partly occupied. There was only an ordnance sergeant in Castle Pinckney, only an ordnance sergeant in Fort Sumter, and a partial garrison at Fort Moultrie. Both Sumter and Moultrie were greatly, and Castle Pinckney slightly, out of repair, with no mounted guns or the usual necessary appurtenances for defense. During the summer of 1860 Congress made an appropriation for these works; and the engineer captain who had been in charge for two years past had, indeed, been ordered to begin and prosecute repairs in the two forts. Whether this step was taken to afford ultimate help to the Union or help to the Rebellion, will perhaps never be historically proved, nor is the fact material.

It is needless at this point to enter upon certain very interesting details showing how these forts, from the very first, became objects of prime solicitude; how the leaders and people of Charleston in various ways manifested their purpose to seize them; how General Scott recommended that they should be reënforced; how the officer in command specifically asked that the garrison in Moultrie might be increased; how Secretary of War Floyd sent an officer to inspect their condition.

A more necessary fact to be stated is that the Administration, on the 13th of November, ordered Major Robert Anderson of Kentucky to take command of the forts and forces in Charleston Harbor. In the execution of this duty Major Anderson reached Fort Moultrie and assumed command on November 21st; and having from his several interviews with the President, Secretary of War, and Lieutenant-General Scott become fully impressed with the importance of his trust, proceeded as a first step to acquaint himself thoroughly with his situation and resources. As a result his report urgently warned the Government that the

harbor must be immediately and strongly reënforced, and this suggestion he repeated from time to time with earnestness and persistence. This judicious advice, however, was neglected by the President and rejected by the Secretary of War. "It is believed,"—so ran the reply and apparently the final decision of the Government,—

"from information thought to be reliable, that an attack will not be made on your command, and the Secretary has only to refer to his conversation with you, and to caution you that should his convictions unhappily prove untrue, your actions must be such as to be free from the charge of initiating a collision. If attacked, you are, of course, expected to defend the trust committed to you to the best of your ability. The increase of the force under your command, however much to be desired, would, the Secretary thinks, judging from the recent excitement produced on account of an anticipated increase, as mentioned in your letter, but add to that excitement, and might lead to serious results."

It is a fair inference from facts not necessary to relate here that the Charleston leaders of secession had knowledge of this decision of the Secretary of War; but so eager was their desire to prevent reënforcements that they proceeded to obtain a substantial pledge in that behalf.

On Saturday, December 8th, four of the representatives in Congress from South Carolina requested an interview of President Buchanan, which he granted them. One of their number has related the substance of their address with graphic frankness:

"Mr. President, it is our solemn conviction that if you attempt to send a solitary soldier to these forts, the instant the intelligence reaches our people (and we shall take care that it does reach them, for we have sources of information in Washington so that no orders for troops can be issued without our getting information) these forts will be forcibly and immediately stormed.

"We all assured him that if an attempt was made to transport reënforcements, our people would take these forts, and that we would go home and help them to do it; for it would be suicidal folly for us to allow these forts to be manned. And we further said to him that a bloody result would follow the sending of troops to those forts, and that we did not believe that the authorities of South Carolina would do anything prior to the meeting of this convention, and that we hoped and believed that nothing would be done after this body met until we had demanded of the general government the recession of these forts." "

Here was an avowal to the President himself—not only of treason at Charleston, but of conspiracy in the executive departments of the general Government; a demand coupled with menace. Instead of meeting these with a stern rebuke and dismissal, the President cowered and yielded. He hastened to assure his visitors that it was his determination "not to reënforce the forts in the harbor and

* Statement of Miles and Keitt to the South Carolina Convention.

thus produce a collision, until they had been actually attacked," or until he had "certain evidence that they were about to be attacked."

The President suggested that "for prudential reasons" it would be best to put in writing what they had said to him verbally. This they readily promised, and on Monday, the 10th, gave him, duly signed by five of the South Carolina representatives, this important paper:

"WASHINGTON, December 9th, 1860.

"In compliance with our statement to you yesterday, we now express to you our strong convictions that neither the constituted authorities, nor any body of the people of the State of South Carolina, will either attack or molest the United States forts in the harbor of Charleston, previously to the action of the convention, and we hope and believe not until an offer has been made through an accredited representative to negotiate for an amicable arrangement of all matters between the State and the Federal Government, provided that no reinforcements shall be sent into those forts, and their relative military status shall remain as at present."

When President Buchanan came to look at the cold, explicit language of this document, he shrank from the definite programme to which it committed him. "I objected to the word 'provided,' as it might be construed into an agreement on my part which I never would make. They said nothing was further from their intention; they did not so understand it, and I should not so consider it."* There followed mutual protests that the whole transaction was voluntary, informal, and in the nature of a mediation; that neither party possessed any delegated authority or binding power.

While the Charleston conspirators had thus taken effectual steps to bind the future acts of the Executive in respect to the forts in Charleston Harbor, and to make sure that the rising insurrection in South Carolina should not be crippled or destroyed by any surprise or sudden movement emanating from Washington, they were not less watchful to counteract and prevent any possible hostile movement against them on the part of Major Anderson or his handful of officers and troops in Fort Moultrie, undertaken on their own discretion. Their boast of secret sources of information in Washington, coupled with subsequent events, furnish unerring proof that Mr. Floyd, Secretary of War, though openly opposing disunion, was already in their confidence and councils, and was lending them such active coöpera-

tion as might be disguised or perhaps still excused to his own conscience as tending to avert collision and bloodshed.

Shortly before, or about the time of the truce we have described, Secretary Floyd sent an officer of the War Department to Fort Moultrie with special verbal instructions to Major Anderson, which were duly communicated and the substance of them reduced to writing and delivered to that officer, on the 11th of December, being the day following the final conclusion of the President's unofficial truce at Washington.

Upon mere superficial inspection this order disclosed only the then dominant anxiety of the Administration to prevent collision. But if we remember that it was issued and sent to Major Anderson without the President's knowledge and without the knowledge of General Scott,† and especially if we keep in sight the state of public sentiment of both Charleston and Washington and the paramount official influences which had taken definite shape in the President's truce, we can easily read between the lines that it was a most artfully contrived document to lull suspicion while it effectually restrained Major Anderson from any act or movement which might check or control the insurrectionary preparations. He must do nothing to provoke aggression; he must take no hostile attitude without evident and imminent necessity; he must not move his troops into Fort Sumter, unless it were attempted to attack or take possession of one of the forts or such a design was tangibly manifested. Practically, when the attempt to seize the vacant forts might come it would be too late to prevent it, and certainly too late to move his own force into either of them. Practically, too, any serious design of that nature would never be permitted to come to his knowledge. Supplement these negations and restrictions by the unrecorded verbal explanations and comments made by Major Buell, by his emphatic and express disapproval of the meager defensive preparations which had been made, such as his open declaration that a few loop-holes "would have a tendency to irritate the people,"‡ and we can readily imagine how a faithful officer, whose reiterated reasonable requests had been refused, felt that under such instructions, amid such surroundings, under such neglect, "his hands were tied" and that he and his little command were a foredoomed sacrifice.§

* Buchanan to Comrs., December 31st, 1860. W. R., I., p. 116.

† "The President has listened to him with due friendliness and respect, but the War Department has been little communicative. Up to this time he has not been shown the written instructions of Major Anderson, nor been informed of the purport of those more recently conveyed to Fort Moultrie verbally by Major

Buell."—[General Scott (by G. W. Lay) to Twiggs, December 28th, 1860. "War Records," Vol. I., p. 580.]

‡ Doubleday's "Sumter," p. 51.

§ In a Senate speech, January 10th, 1861 ("Globe," page 307), Jefferson Davis, commenting on these orders, while admitting that they empowered Major Anderson to go from one post to another, said, "though his orders were not so designed, as I am assured."

THE RETIREMENT OF CASS.

THE non coercion doctrine had been yielded as early as November 20th, in the Attorney-General's opinion of that date. The fact was rumored not only in the political circles of the capital, but in the chief newspapers of the country; and the three secession members of the Cabinet had doubtless communicated it confidentially to all their prominent and influential confederates. Since that time South Carolina had continued her preparation for secession with unremitting industry; Mississippi had authorized a convention and appointed commissioners to visit all the slave States and propagate disunion—among them Mr. Thompson, Buchanan's Secretary of the Interior, exercised this insurrectionary function while yet remaining in the Cabinet. North Carolina had refused to go into an election of United States senator; Florida had passed a convention bill; Georgia had initiated legislative proceedings to bring about a conference of the Southern States at Atlanta; both houses of the National Congress had rung with secession speeches, while daily and nightly caucuses took place at Washington.

Mr. Buchanan's truce with the South Carolina representatives had as little effect in arresting the secession intrigues as his non-coercion doctrine officially announced in the annual message. On the evening of the very day (December 8th) on which he received the South Carolina pledge, his Secretary of the Treasury, Howell Cobb of Georgia, tendered his resignation, announcing in the same letter his intention to embark in the active work of disunion. "My withdrawal," he wrote to the President, "has not been occasioned by anything you have said or done." Ignoring the fact that the Treasury was prosperous and solvent when he took charge of it, and that at the moment of his leaving, it could not pay its drafts, Mr. Cobb five days later published a long and inflammatory address to the people of Georgia, concluding with this exhortation: "I entertain no doubt either of your right or duty to secede from the Union. Arouse then all your manhood for the great work before you and be prepared on that day to announce and maintain your independence out of the Union, for you will never again have equality and justice in it."

The President had scarcely yet found a successor for Mr. Cobb when the head of his Cabinet, Lewis Cass, Secretary of State, also tendered his resignation and retired from the Administration.

The incident of Secretary Cass's resignation brings into relief the mental reservations under which Buchanan's paradoxical theories had

been concurred in by his Cabinet. A private memorandum, in Mr. Buchanan's handwriting, commenting on the event, makes the following emphatic statement:

"His resignation was the more remarkable on account of the cause he assigned for it. When my late message (of December, 1860) was read to the Cabinet before it was printed, General Cass expressed his unreserved and hearty approbation for it, accompanied by every sign of deep and sincere feeling. He had but one objection to it, and this was, that it was not sufficiently strong against the power of Congress to make war upon a State for the purpose of compelling her to remain in the Union; and the denial of this power was made more emphatic and distinct upon his own suggestion."—[G. T. Curtis's "Life of Buchanan," II., p. 399.]

But this position was probably qualified and counterbalanced in his own mind by the President's positive promise that he would collect the Federal revenue and protect the Federal property. Little by little, however, delay and concession rendered this impossible. The collector at Charleston still nominally exercised his functions as a Federal officer; but it was an open secret among the Charleston authorities, and must also by this time have become known to the Government at Washington, that he was only holding the place in trust for the coming secession convention. As to protecting the Federal property, the refusal to send Anderson troops, the President's truce, the gradual development of Mr. Buchanan's irresolution and lack of courage, and finally Mr. Cobb's open defection, must have convinced Mr. Cass that under existing determinations, orders, and influences it was an utterly hopeless prospect.

The whole question seems to have been finally debated and decided in a long and stormy Cabinet session held on December 13th.* The events of the past few days had evidently shaken the President's confidence in his own policy. He startled his dissembling and conspiring Secretary of War with the sudden question, "Mr. Floyd, are you going to send recruits to Charleston to strengthen the forts?" "Don't you intend to strengthen the forts at Charleston?" The apparent change of policy alarmed the Secretary, but he replied promptly that he did not. "Mr. Floyd," continued Mr. Buchanan, "I would rather be in the bottom of the Potomac to-morrow than that these forts in Charleston should fall into the hands of those who intend to take them. It will destroy me, sir, and, Mr. Floyd, if that thing occurs it will cover your name with an infamy that all time can never efface, because it is in vain that you will attempt to show that you have not some complicity in handing over those forts to those who take them." The wily

* Floyd's Richmond speech. "N. Y. Herald," January 17th, 1861, p. 2.

Secretary replied, "I will risk my reputation, I will trust my life that the forts are safe under the declarations of the gentlemen of Charleston." "That is all very well," replied the President, "but does that secure the forts?" "No, sir; but it is a guaranty that I am in earnest," said Floyd. "I am not satisfied," said the President.

Thereupon the Secretary made the never-failing appeal to the fears and timidity of Mr. Buchanan. He has himself reported the language he used:

"I am sorry for it," said he; "you are President, it is for you to order. You have the right to order, and I will consider your orders when made. But I would be recreant to you if I did not tell you that this policy of garrisoning the forts will lead to certain conflicts; it is the inauguration of civil war, and the beginning of the effusion of blood.

"[If] it is a question of property, why not put an ordnance sergeant—a man who wears worsted epaulets on his shoulders and stripes down his pantaloons—as the representative of the property of the United States? That will be enough to secure the forts. If it is a question of property, he represents it,* and let us wait until the issue is made by South Carolina. She will go out of the Union and send her commissioners here. Up to that point the action is insignificant. Action after this demands the attention of the great council of the nation. Let us submit the question to Congress—it is for Congress to deal with the matter."

This crafty appeal to the President's hesitating inclinations was seconded by the active persuasions of the leading conspirators of Congress whom Floyd promptly called to his assistance.

"I called for help from that bright Saladin of the South, Jefferson Davis of Mississippi—and I said, 'Come to my rescue, the battle is a little more than my weak heart can support—come to me,' and he came. Then came that old jovial-looking, noble-hearted representative from Virginia, James M. Mason. Here came that anomaly of modern times, the youthful Nestor, here came Hunter. From the North, the South, the East, and the West there came up the patriots of the country, the champions of constitutional liberty, and they talked with the President of the United States, and they quieted his fears and assured him in the line of duty. They said, 'Let there be no force'; and the President said to me, 'I am content with your policy!' and then it was that we determined that we would send no more troops to the harbor in Charleston."—[Floyd's Richmond speech. "N. Y. Herald," January 17th, 1861, p. 2.]

With a last effort to rouse the President from his lethargy, Cass demanded in the Cabinet meeting of the 13th, that the forts should be strengthened. But he was powerless to break the spell. Says Floyd:

"The President said to him in reply, with a beautiful countenance and with a heroic decision that I shall never forget, in the council chamber, 'I have considered

* Jefferson Davis, in his "Rise and Fall of the Confederate Government," p. 215, Vol. I., also lays claim to this suggestion: "The President's objection to this was, that it was his bounden duty to preserve and protect the property of the United States. To this I replied with all the earnestness the occasion demanded,

this question—I am sorry to differ from the Secretary of State—I have made up my mind. The interests of the country do not demand a reënforcement of the forces in Charleston. I cannot do it—and I take the responsibility of it upon myself."

The other Union members of the Cabinet received the rumor of Mr. Cass's resignation with gloomy apprehensions. Postmaster-General Holt,† with whom by reason of their loyal sympathy he had been on intimate terms, hastened to him to learn whether the report were indeed true and whether his determination were irrevocable. Cass confirmed the fact with his own lips; saying that, representing the Northern and loyal constituency which he did, he could no longer without dishonor to himself and to them remain in such treasonable surroundings. Holt endeavored to persuade him that under the circumstances it was all the more necessary that the loyal members of the Cabinet should remain at their posts, in order to prevent the country's passing into the hands of the secessionists by mere default. But Cass replied, No; that the public feeling and sentiment of his section would not tolerate such a policy on his part. "For you," he said, "coming from a border State, where a modified, perhaps a divided, public sentiment exists, that is not only a possible course, but it is a true one; it is your duty to remain, to sustain the Executive and counteract the plots of the traitors. But my duty is otherwise; I must adhere to my resignation."

FORT SUMTER.

THE Charleston conspirators were aware that, in their well-laid intrigues to obtain possession of all the Charleston forts, there was one point of weakness and danger. They had secured a virtual pledge that no reënforcements would be sent, and they had reasonable confidence that at any desirable moment they could, by a sudden, overwhelming assault, capture Fort Moultrie with its slender garrison of sixty soldiers under Anderson's command. But if Anderson should suddenly move his garrison into Fort Sumter, a larger and stronger work, rising sheer out of the waters of the bay, midway in the mouth of the harbor, their task would be more serious, perhaps impossible. Against such a contingency they had taken two important precautions. The vaguely worded instructions of Secretary Floyd, as interpreted by themselves, seemed to forbid such a movement on his part; and to make assurance more

that I would pledge my life that, if an inventory were taken of all the stores and munitions in the fort, and an ordnance sergeant with a few men left in charge of them, they would not be disturbed."

† Holt, conversation with J. G. N. MS.

certain they had set two guard-boats to patroling the harbor at night to discover and prevent any surprise of this character.

Anderson also clearly saw the point of military advantage, and by a very pointed suggestion asked on December 22d for instructions from the War Department for a movement from Moultrie to Sumter,* but found no response in the hopes and designs of Secretary Floyd.

The officers meantime freely visited the city and exchanged social courtesies with leading secessionists with many mutual protestations of the highest regard. "We appreciate your position," said their entertainers. "It is a point of honor with you to hold the fort, but a political necessity obliges us to take it."† But after the passage of the ordinance of secession, Major Anderson had ceased his visits to Charleston. Christmas day, however, was once more celebrated with these social amenities at a family party in Moultrieville, on Sullivan's Island. When Anderson returned from the scene of merry-making, in the solitude of his soldier's room he formed the resolution to abandon Fort Moultrie at the earliest possible moment; and on the evening of December 26th the transfer was secretly and successfully accomplished.

A BLUNDERING COMMISSION.

ON Wednesday, December 26th, at 3 o'clock P. M., it being about the same time of the same day that Anderson was completing his preparations to leave Moultrie, Messrs. Barnwell, Adams, and Orr, the three commissioners from South Carolina, reached Washington. They were by authority of the convention empowered to negotiate a treaty of peace and friendship between the embryo republic and the United States; to secure the delivery of the forts, arsenal, and light-houses; to divide the public property and apportion the public debt, and generally to settle all pending questions, upon the assumption that South Carolina was no longer a member of the Union, but an independent foreign State.

There being no concealment about the temper and purpose of Mr. Buchanan, the arrival of the commissioners was promptly communicated to him, and he with an equal promptness appointed an interview with them at 1 o'clock of the next day, Thursday, December 27th. On their part, the commissioners deliberately settled themselves for business by taking a house and appointing a secretary. But

at sunrise on Thursday things were no longer as they had been at the previous sunset. Anderson's move on the military chess-board had changed not only the game of war but, yet more radically, the game of politics. The Charleston authorities, dumfounded by the event, probably suspected treachery from the Administration, and under this impulse interdicted the transmission of the news northward‡ until the next forenoon. They, however, sent the information to the commissioners at Washington, who communicated it to Mr. Buchanan.§

Catching at straws, Buchanan's first impulse was to assume that Anderson had abandoned Moultrie in a panic, and to restore the *status* by ordering him back into the fort. He had the distinct impression that his orders did not contemplate or permit the change; showing either how ignorant he was of the Buell memorandum, which had passed under his personal notice only six days before, or how thoroughly that contradictory document had mystified him as well as everybody else. Had the influences which were theretofore paramount in Washington yet remained intact, it is more than likely that this first impulse of the President would have been carried out. But things were changed at the capital as well as in Charleston. An embezzlement of near a million dollars' worth of Indian Trust Bonds had come to light and kept the Federal city and the whole country in a ferment for nearly a week. A department clerk and a New York contractor were in prison; but the responsibility of the affair had been brought home to Secretary Floyd so pointedly that three days before the President requested his resignation. Floyd was in no haste to comply, and Mr. Buchanan was too timid to dismiss his disgraced minister summarily, who still exercised the functions of Secretary of War.

Anderson's report, written at 8 P. M. on December 26th and sent by mail, had not yet reached Washington. Floyd was, therefore, incredulous about what the commissioners told him, but took immediate steps to verify the rumor. "Information has reached here this morning," he telegraphed to Anderson on the morning of the 27th, "that you have abandoned Fort Moultrie, spiked your guns, burned the carriages, and gone to Fort Sumter. It is not believed, because there is no order for any such movement. Explain the meaning of this report."

"The telegram is correct," replied Anderson; "I abandoned Fort Moultrie because I

* Anderson to A. G., December 22d, 1860. W. R., I., p. 195.

† Doubleday, p. 47.

‡ The news of the evacuation of Moultrie, which should have been telegraphed before midnight, did not

reach Washington till about noon next day, and then only by way of Baltimore. (Washington "Star," 27th, Baltimore telegram.)

§ Mr. Buchanan's Administration, p. 180.

was certain that if attacked my men must have been sacrificed, and the command of the harbor lost. I spiked the guns and destroyed the carriages to keep the guns from being used against us." And he added, "If attacked, the garrison would never have surrendered without a fight."

Meanwhile the Cabinet was called together to deliberate on the unwelcome news. During the two weeks which had elapsed since the retirement of Cass and Cobb, a profound change had occurred in that body of presidential advisers. Governor Thomas of Maryland, also a secessionist, was made Secretary of the Treasury, a substitution which brought no reform; but, on the other hand, Black had not only been made Secretary of State but had been marvelously transformed in his political sentiments and acts by being brought into contact and companionship with Edwin M. Stanton, a man of iron will and hearty Union sentiments, who was nominated to succeed him as Attorney-General. A new and healthier atmosphere pervaded the executive council chamber in the discussion of the crisis. But the political condition of the nation was so abnormal, the public service so disorganized, and the executives so timid, that for three days and four nights, from the evening of the 27th to the morning of the 31st, Anderson hung doubtfully in the balance between honorable approval and disgraceful censure.*

Secretary Floyd maintained with vehemence the existence of a mutual pledge created by the President's truce of the 10th; and claimed that Anderson had violated this pledge, since there was nothing in his instructions which could in any wise justify his removal to Sumter. Against this assumption Mr. Black, the new Secretary of State, took much more radical union ground than he had hitherto occupied. He insisted that Anderson's transfer was in perfect accordance with his orders, announced his unqualified approval of it, and asserted the duty of the Administration to sustain it. In regard to the issue thus raised, the President exhibited his usual irresolution. He denied the technical existence of a pledge, but could not, of course, deny its spirit; and sided with Floyd in the belief that Anderson's zeal had outrun the limit of his instructions. The Buell memorandum and the modifying order were sent for in hot haste, and now for the first time underwent Cabinet criticism. The studied ambiguity of these papers furnished arguments for both sides; the entire question turning upon the point whether Anderson had "tangible evidence of a design to proceed to a hostile act." Floyd now submitted a written

* C. F. Black, "Essays and Speeches of J. S. Black," pp. 11 and 12.

demand that he should be allowed at once to order the garrison to be withdrawn entirely from the harbor of Charleston, alleging that the Government was dishonored in the violation of its most solemn pledges.

Pending the discussion, the Cabinet adjourned until evening. The President's audience to the commissioners had been postponed until the next day; but they were not idle. All that day and until midnight they were the center of the consternation, the hopes, and the counsels of the conspirators.† Meanwhile the official leakage, the Baltimore dispatches, and finally the issue of the afternoon papers had communicated Anderson's stroke to the whole Federal city, which seethed with excitement. General Scott, confined to his sick-room, sent his aide-de-camp to remind the President of the existence of such an officer as the General-in-Chief of the American armies. In the evening the adjourned Cabinet meeting resumed its deliberations, and continued the session to a late hour. News went forth to the Northern newspapers that night that before its close a vote of four to three had decided against ordering the troops back to Moultrie. This news, however, was premature. Whether a vote was taken or not, the question did not reach a decision. What was done is described in the language of Mr. Buchanan:

"In this state of suspense, the President determined to await official information from Major Anderson himself. After its receipt, should he be convinced upon full examination that the major, on a false alarm, had violated his instructions, he might then think seriously of restoring for the present the former *status quo* of the forts."

But the aggressive acts of the insurgents were continually outrunning the vacillating decisions of the President. During the afternoon and evening of Thursday, Fort Moultrie, Castle Pinckney, the Arsenal, Post-office, and Custom-house at Charleston passed into the hands of the insurrection. Like the news of Anderson's transfer the day before, the information was suppressed by the Charleston authorities. Beyond its transmission perhaps to their friends in Washington, none of the transactions at Charleston on Thursday afternoon and night were permitted to be telegraphed to the North, until about 10 o'clock on Friday morning the 28th, in the hope that the order for Anderson's return could be extorted from the President before he should be stung to resistance.

But the seizures at Charleston, made on the personal judgment of Governor Pickens, and against at least the implied consent of the convention, were of doubtful expediency for them,

† Charleston "Courier," December 28th, 1860. Washington dispatch of 27th.

and were so regarded by many ardent secessionists. The "Richmond Whig" denounced them as a "shameful outrage," and soundly berated South Carolina for not being content to go out of the Union peacefully. These seizures, however, might still have been turned to advantage, but for the more serious blunder now committed by the commissioners themselves.

Their promised interview with Mr. Buchanan, postponed from 1 o'clock on Thursday, on account of the Anderson news, was held at half past 2 on Friday the 28th. The President had that forenoon heard of the Charleston outrages, and knew that from being the agents of a conspiracy they had now become the emissaries of an insurrection. But he failed to note the declaration of the Constitution that treason against the United States consists in levying war against them, or in adhering to their enemies, giving them aid and comfort. According to his explanations the Constitution indeed forbade his recognizing the authority of the commissioners, or deciding their claim; but he would give this claim point and dignity by referring it officially to Congress, with the sanction of a presidential message.

Had sound judgment guided them they would have seized eagerly upon this *quasi* acceptance of their mission,—which virtually gave them the President as an ally,—divided and paralyzed Congress by a sudden and combined intrigue, and made a conciliatory appeal to the commercial apprehensions of the Northern cities and manufacturing districts. But instead they now ventured their whole success upon a single desperate chance. Assuming a tone of anger and accusation, they impugned the honor of the Government, asked explanations of Anderson's conduct under the futile threat of suspending negotiations which were not yet begun, and urged the immediate withdrawal of the troops from the harbor of Charleston.

Under wiser advice Mr. Buchanan's hesitating decision finally went against them; and in that failure terminated the last and only hope of accomplishing peaceable secession.

THE CABINET RÉGIME.—BUCHANAN'S VIRTUAL ABDICATION.

THE ultimatum presented by the commissioners was at once made the subject of a Cabinet discussion, and continued in the evening of the same day. No decision was arrived at, and the meetings would be without special interest, were it not for the report of one of the incidents that shows the feeling which divided the presidential advisers into two irreconcilable factions. The scene is given in

the language of one of the participants in the evening session of Friday, December 28th, who afterward recounted the event in the council-room of the White House itself.

"The last I saw of Floyd," said Secretary Stanton, "was in this room, lying on the sofa which then stood between the windows yonder. I remember it well—it was on the night of the 28th of December, 1860. We had had high words and had almost come to blows, in our discussion over Fort Sumter. Thompson was here—Thompson was a plausible talker, and as a last resort, having been driven from every other argument, advocated the evacuation of the fort on the plea of generosity. South Carolina, he said, was but a small State with a sparse white population—we were a great and powerful people and a strong, vigorous government. We could afford to say to South Carolina, 'See, we will withdraw our garrison as an evidence that we mean you no harm.'"

Stanton replied to him, "Mr. President, the proposal to be generous implies that the Government is strong, and that we as the public servants have the confidence of the people. I think that is a mistake. No administration has ever suffered the loss of public confidence and support as this has done. Only the other day it was announced that a million of dollars had been stolen from Mr. Thompson's department. The bonds were found to have been taken from the vault where they should have been kept, and the notes of Mr. Floyd were substituted for them. Now it is proposed to give up Sumter. All I have to say is, that no administration, much less this one, can afford to lose a million of money and a fort in the same week. Floyd remained silent and did not reappear in that chamber."*

The Cabinet was again convened on the evening of Saturday, December 29th; but when it met, there was one vacant seat at the council-board. During that day, Floyd sent in his formal resignation, complaining that he had been subjected "to a violation of solemn pledges and plighted faith." The resignation was duly accepted on the following Monday, and the War Department placed provisionally under the charge of Postmaster-General Holt.† To the six assembled councilors, Mr. Buchanan now submitted the draft of his reply to the commissioners. The precise terms and substance of this document remain unpublished, and we are compelled to gather its import from a rather elaborate written criticism of it by a member of the Cabinet. This indicates, however, with sufficient clearness

* Stanton, conversation. J. G. N., Personal memoranda. MS.

† R. R., I., Doc. 10.

that the paper, like all Mr. Buchanan's writings and conversations of this period, was contradictory, loose in expression, and entirely lacking in any clear presentation of issues.

Most radical of all the changes effected by these developments was that wrought in the Hon. Jeremiah S. Black, Secretary of State. Growing with his increasing national responsibilities, he now, with the Sumter crisis, seems to have risen, for a time at least, to genuine leadership.

On Sunday morning, December 30th, convinced of the President's intention to adhere to his submitted reply to the commissioners, Mr. Black convened the Union section of the Cabinet, and announcing to them his inability to further sustain the President's contemplated action, declared his intention to resign, in which resolve he was also joined by Mr. Stanton. After due discussion and reflection, Mr. Toucey carried the information of this threatened defection to the President. Mr. Buchanan's courage utterly broke down before the prospect of finding himself alone in face of the political complications which came crowding upon him. He at once sent for Mr. Black; and after a confidential interview, the details of which have never been revealed, he gave the objectionable draft of his reply to his Secretary of State, with liberty to make all changes and amendments which in his opinion might be necessary. It was the President's virtual abdication.

Mr. Black rewrote his answer to the commissioners, refusing their demand. This result abruptly terminated their mission, and sent them home, not alone in the bitterness of disappointment, but to the great consternation of the Charleston conspirators. It also left Anderson in command and possession of Sumter, with at least the implied approval of the Government. There is not space here to relate the events of the next few days: the sudden change of policy pervading the Executive Mansion; the vigorous efforts of the Union members of the Cabinet to send reinforcements to Anderson; the relief expedition which sailed in the steamer *Star of the West*, and its unsuccessful effort to reach Fort Sumter; how Governor Pickens began the construction of batteries around it with which the rebels bombarded and captured the fort some three months later; and finally the further transformation of the executive council of the President by the retirement of the two secessionist members Thompson and Thomas, the latter being succeeded by John A. Dix as Secretary of the Treasury, who has left so brilliant a record as a stanch defender of the Government and the Union. With the adjournment of that Cabinet meeting on Saturday

night, December 29th, therefore, terminated the real administration of James Buchanan. Thenceforward, though he still continued to affix his official signature, the country was practically governed, in his name, by his Cabinet, to the end of the presidential term.

THE COTTON "REPUBLICS."

IN the main the secession incidents and proceedings enacted in South Carolina were imitated and repeated in the other cotton States. Their several governors initiated the movement by early official action,—proclamations, messages, and orders. The office-holders at each State capital formed a convenient local caucus and committee of conspiracy. The programme in each case ran through essentially the same stages. There was first the meeting of the legislature, prompted and influenced by the State officials and the senators and representatives in Congress. Then under a loud outcry of public danger which did not exist, hasty measures to arm and defend the State; large military appropriations and extensive military organization. Next an act to call a convention, ostensibly to consult public opinion, but really for the occasion to rouse and mislead it. In each of the cotton States the Breckinridge Democracy, the most ultra of the three factions, all pro-slavery, was largely in the majority. Again, the long political agitation had brought into power and prominence the most radical leaders of this extreme party. These radical leaders were generally disunionists at heart, even where they had not been active and persistent conspirators. They now took up with alacrity the task of electing a secession convention. That the people were not with them a month before the presidential election is proved by the replies of the several governors to South Carolina, which are cited in a previous chapter. Nothing but the election itself had occurred to change that feeling; no threat, no act, no law, no catastrophe. Had governors and officials remained silent, the people would have felt no want and seen no danger. But when official action began the agitation, first by proclamations, then by legislative enactments, and lastly by forcing the issue upon the people through an election for delegates, there came an inevitable growth and cumulation of excitement. In this election it was the audacious, the ambitious, the reckless element which took the lead; which gathered enthusiasm, which organized success.

It must be remembered that this result was reached under specially favoring conditions. The long slavery agitation had engendered a brooding discontent, and the baseless

complaint of sectional injustice had grown through mere repetition from clamor into belief. The presidential election left behind it the sharp sting of defeat. Not in form and in law, but nevertheless in essential characteristics, the South was controlled by a landed aristocracy. The great plantation masters dominated society and politics. There was no denuded and healthy popular action, as in the town meetings of New England. Even the slaves of the wealthy proprietors spoke with habitual contempt of the "poor white trash" who lived in mean cabins and hoed their own corn and cotton. Except in Georgia the opposition to the secessionists' programme was either hopelessly feeble or entirely wanting. The Bell and Douglas factions had bitterly denounced Lincoln and the Republicans during the presidential campaign. Disarmed by their own words, they could not now defend them. The seaboard towns and cities of the South, jealous of the commercial supremacy of the North, anticipated in independence and free trade a new growth and a rich prosperity. Over all floated the constant dream of Southern Utopians, an indefinite expansion southward into a great slave empire. We may infer that under these various causes the election in most instances went by default.

Three special agencies coöperated with marked effect to stimulate the movement. Very early each cotton State sent commissioners to each of the other Southern States, and in every case the most active and zealous secessionists were of course appointed. These commissioners attended, harangued, and intrigued with the various deliberative assemblies, and thus constituted a network of most industrious propaganda. Another potent influence was the assembling of military conventions, that is, convocations of the captains, majors, colonels, and would-be generals, to spur on or intimidate lagging legislatures and conventions. Finally, the third and most effective piece of machinery was the State delegations in Congress assembled in Washington city at the beginning of December, and sending a running fire of encouragement or orders home to the capitals of their States.

Even with all this organization acting intelligently and persistently to a common end, from two to three months were required to work up the people of the cotton States to an acquiescence in the rebellion the conspirators had for years been planning. Without being exactly of contemporaneous date, it happened that in general the month of November witnessed the assembling of the legislatures and the making of necessary laws and appropriations. The month of December was

mainly occupied by the election of delegates to the State conventions. In this stage the voice of central authority from Washington was begun to be utilized. While the election excitement was at its highest ferment, there came from Washington, under date of the 14th of December, the revolutionary circular, signed by about one-half the Southern senators and representatives in Congress already quoted elsewhere. This circular announced that argument was exhausted, that hope was extinguished, that the Republicans would grant nothing which would or ought to satisfy the South, and that the honor, safety, and independence of the Southern people required immediate separate State secession, and the organization of a Southern confederacy. The effect of a congressional firebrand of such dimensions thrown upon the inflammable temper of the cotton States at such a juncture, may be easily imagined. Their people could not know that no single assertion in this circular was warranted by the facts; that Congress had not deliberated, that the compromise committees had not reported, and that the Republicans had in no shape presented or declared an ultimatum. The circular had been issued for a purpose, and served the end completely. Few Southern voters or speakers could dare to stand up and deny in Georgia or Alabama the accusation made by these "honorable" signers in Washington.

But the central cabal did not stop with this single *pronunciamento*. By this time the revolution, both local and central, had gained an accelerated momentum, and was rushing rapidly to its climax. Non-coercion was promised, Cass was driven from the Cabinet, the President was overawed, Congress was demoralized. Secession had secured a free path, and counted on an easy victory. So far as had been divulged, the programme hitherto was to complete separation by easy stages during the remainder of Mr. Buchanan's term, and not to organize the new Confederacy till after the 4th of March. But about New Year's the central conspiracy received a serious check. There was a Cabinet crisis. Buchanan momentarily asserted himself. Floyd was in turn driven from the Cabinet, the Unionists gained control of it, and Holt was made Secretary of War. This portended loyalty, decision, energy, reinforcements. Immediately there came a shower of telegrams and orders from the Washington fire-eaters to the cotton-State leaders, proclaiming danger and urging action. The central cabal was called together, deliberated earnestly, and perfected and hastened the plot. At a caucus held on January 5th (in one of the rooms of the Capitol building itself, it is said) the decisive and final rev-

olutionary programme committed itself to the following distinct points and plan. First: Immediate secession. Second: A convention at Montgomery, Alabama, not later than the 15th of February, to organize a Confederacy. Third: That, to prevent hostile legislation under the changed and loyal impulses of the President and his reconstructed Cabinet, the cotton-State senators should yet remain awhile in their places, to "keep the hands of Mr. Buchanan tied." Finally, and most important of all, the caucus appointed a committee, consisting of Jefferson Davis and Senators Slidell and Mallory, "to carry out the object of this meeting."* The future chief of the great rebellion was chosen to preside over its primary organization.

If there had been any hesitation in the several State conventions about taking the final plunge, we may suppose that it disappeared when the programme outlined in this central caucus of January 5th, at Washington, was transmitted. We find that nearly the whole secession movement very speedily followed. Mississippi passed her ordinance on January 9th, Florida on January 10th, Alabama on January 11th, Georgia on January 19th, Louisiana on January 26th, and Texas, where peculiar conditions existed, on February 1st. Immediately connected with the passage of these secession ordinances, in some instances even preceding them, the next step in the insurrectionary scheme was taken. Each governor who organized the revolution in his State, now finding a little army of impulsive volunteers and ambitious officers at his nod and beck, orders two or three regiments to the nearest fort or arsenal, where an ordnance sergeant, or an attenuated infantry or artillery

company of Federal soldiers is representing the government title rather than the government power. The insurgents demand possession, and make a display of force. The officer in charge yields to the inevitable. He receives the demand for surrender in the name of the State; he complies under protest. There is a salute to the flag, peaceable evacuation, and he is allowed unmolested transit home as a military courtesy. By this process there was a quick succession of captures through which all the military strongholds and depots in the cotton States, excepting Fort Sumter in Charleston Harbor, Fort Pickens in Pensacola Harbor, Fort Taylor at Key West, and Fort Jefferson on Tortugas Island passed to the occupation and use of the rebellion; giving it a vantage-ground for defense, and a store of war material for offense, which for the first time since the presidential election gave the revolution a serious and formidable strength. We have thus far described the secession movement throughout the South in its general aspect. A glance at some of its features more in detail may not be without interest.

The State of Florida was the most zealous follower of South Carolina. She has a magnificent geographical area; and even allowing that perhaps three-fourths of it may be rivers and swamps, there yet remain near ten million acres of habitable land; which, with a climate favorable to a class of sub-tropical products much in demand, is enough to make her eventually the garden State of the South. But this immense domain was practically a wilderness, notwithstanding her earliest permanent settlement was almost three centuries old. Her white population did not reach the ratio of one representative

* Senator Yulee of Florida to Joseph Finegan, Esq.
"WASHINGTON, January 7, 1861.

"MY DEAR SIR: On the other side is a copy of resolutions adopted at a consultation of the Senators from the seceding States—in which Georgia, Alabama, Louisiana, Arkansas, Texas, Mississippi, and Florida were present. The idea of the meeting was that the States should go out at once, and provide for the early organization of a Confederate Government, not later than 15th February. This time is allowed to enable Louisiana and Texas to participate. It seemed to be the opinion that if we left here, force, loan, and volunteer bills might be passed, which would put Mr. Lincoln in immediate condition for hostilities; whereas by remaining in our places until the 4th of March, it is thought we can keep the hands of Mr. Buchanan tied, and disable the Republicans from effecting any legislation which will strengthen the hands of the incoming Administration. The resolutions will be sent by the delegation to the President of the Convention. I have not been able to find Mr. Mallory this morning. Hawkins is in Connecticut. I have therefore thought it best to send you this copy of the resolutions.

"In haste, yours truly,

"D. L. YULEE.

"JOSEPH FINEGAN, Esq.

"'Sovereignty Convention,' Tallahassee, Florida."

The following were the resolutions referred to:

"Resolved 1. That in our opinion each of the Southern States should, as soon as may be, secede from the Union.

"Resolved 2. That provision should be made for a convention to organize a Confederacy of the seceding States, the convention to meet not later than the 15th of February, at the city of Montgomery, in the State of Alabama.

"Resolved, That in view of the hostile legislation that is threatened against the seceding States, and which may be consummated before the 4th of March, we ask instructions whether the delegations are to remain in Congress until that date for the purpose of defeating such legislation.

"Resolved, That a committee be and are hereby appointed, consisting of Messrs. Davis, Slidell, and Mallory, to carry out the objects of this meeting."

"The copy of these resolutions, forwarded by Senator Mallory January 6th, 1861, to the president of the Florida Convention, shows that they were adopted on the 5th of that month, and that they were signed by Messrs. Davis and Brown, of Mississippi; Hemphill and Wigfall, of Texas; Slidell and Benjamin, of Louisiana; Iverson and Toombs, of Georgia; Johnson, of Arkansas; Clay, of Alabama, and Yulee and Mallory, of Florida." W. R., Vol. I., 443-4.

in Congress.* There was not a single town of three thousand inhabitants within her borders. She therefore became an easy prey to her ultra pro-slavery leaders, who were the first to applaud and second the Charleston insurrection. "Florida is with the gallant Palmetto State," wrote her governor, November 9th; and his message to the legislature, November 26th, clamored for "secession from our faithless, perjured Confederates." Under the manipulations of such an executive, backed by the equally aggressive advice and exertions of her two United States senators, prominent among the conspirators at Washington, she went through the forms of a convention, and the passing of a secession ordinance, January 10th. Her governor, with total disregard of authority, had already seized the arsenal at Apalachicola on January 5th, Fort Marion and the ordnance depot at St. Augustine on the 7th, as well as a schooner belonging to the Coast Survey. There were, in the arsenal, no arms, but 500,000 musket cartridges, 300,000 rifle cartridges, and 50,000 pounds of gunpowder. On the 8th he ordered the seizure of the navy yard and forts at Pensacola, which was accomplished on the 12th. However insignificant in her political power, the gain of Florida was nevertheless of great military and strategical value to the rebellion.

In Mississippi, the revolutionary sentiment had long been fostered by her most able and influential politicians. Jefferson Davis, eager to wear the mantle of Calhoun, had two years before announced the new rebellion. His speech at Vicksburg, November 27th, 1858, is thus reported in the "Daily Mississippian":

"Before concluding his remarks, he would anticipate the interrogatory which his audience might be disposed to propound to him, in view of the fast growing strength of the abolition party, as to what policy he would recommend in the event of the triumph of that party in 1860. He was for resistance—stern resistance. Rather than see the executive chair of the nation filled by a sworn enemy of our rights, he would shatter it into a thousand fragments before he had an opportunity of taking his seat. . . . The Government is at an end the very moment that an abolitionist is elected to the presidency."

The governor of Mississippi also was one of the most advanced revolutionists in the South. He declared himself ready for action as early as August 30th, 1860.

"I assure you," wrote he, "that I do sympathize and expect to continue to act with those who dare all and hazard all, rather than see Mississippi become a dependent province of a Black Republican government, and hold her constitutional rights by the frail tenure of

Black Republican oath. When sparks cease to fly upwards, Comanches respect treaties, and wolves kill sheep no more, the oath of a Black Republican might be of some value as a protection to slave property."

With Jefferson Davis in the Senate to conspire and advise, and Governor Pettus at home to order and execute, the fate of Mississippi could not long remain in doubt. The legislature had in the previous winter provided a military fund of \$150,000. Early in October the State made a purchase of arms, which at Jefferson Davis's request, and with Floyd's concurrence, were obligingly inspected by a government officer. The legislature was convened to meet, November 26th, to consider "the propriety and necessity of providing surer and better safeguards for the lives, liberties, and property of her citizens than have been found or are to be hoped for in Black Republican oaths." Commissioners to other States were appointed, and an election ordered, in pursuance of which a convention met, January 7th, and passed a secession ordinance on January 9th, 84 yeas to 15 nays. The proceedings, as in other States, were secret and precipitate. Military organization was stimulated to the utmost, and on the 20th the unfinished fort on Ship Island and the Marine Hospital on the Mississippi River were seized by the insurrectionists at the governor's orders.

The State of Alabama had by her dominant partisanship on the slavery question been carried farther toward revolt than the other cotton States. Her legislature, on February 24th, 1860, with but two dissenting voices, provided by joint resolution that in case of the election of a Republican President, the governor should at once by proclamation order an election of delegates to a convention "to consider and do whatever in the opinion of said convention the rights, interests, and honor of the State of Alabama requires [*sic*] to be done for their protection." A fund of \$200,000 was appropriated for "military contingences"; and the governor was further authorized to send delegates to any future convention of the slave States.

A week after the November elections, the governor in a public letter announced that he would exercise this power to inaugurate revolution as soon as the choice of Lincoln should be made certain by the vote of the electoral college on December 5th. In the same letter he made a labored argument that Alabama ought to secede at once and "coöperate afterward." His proclamation was in due time issued, and the delegates were elected on December 24th. A spirited canvass seems to have been made. Judge Campbell, of the United States Supreme Court, addressed the voters in an earnest letter against disunion. Partisans separated themselves into three groups desig-

* The population of Florida in 1860 was: White, 77,748; free colored, 932; slave, 61,745; total, 140,425. The ratio of representation for Members of Congress, from 1852 to 1863, was 93,423.—"Spofford's American Almanac," 1873, p. 170.

nated respectively as "submissionists," "co-operationists," and "straight-out secessionists." The southern half of the State, embracing the cotton-lands and strong slave counties on the gulf, was intensely revolutionary; the northern end, reaching up towards the commerce of the free States, was, or believed itself to be, conservative and union-loving; and the final popular decision was supposed to hang in considerable doubt.

The meeting of the convention at Montgomery, January 7th, soon dispelled this idea. On the first day it unanimously adopted a resolution declaring in substance that "Alabama cannot and will not submit to the Administration of Lincoln and Hamlin." Why any of the members after such a vote should have hesitated to commit themselves to the full scope of the conspirator's programme, shows the confused perception of their own attitude and intentions. They did not appear to realize how helplessly they were drifting in a current of revolution. Upon such material the radical secessionists concentrated their influence. Outside pressure gathered in overwhelming force. Telegrams poured in upon them in profusion. "They came so thick and fast, they seemed like snowflakes to fall from the clouds," said one of the members. Crowds besieged the doors. The governor had on January 4th, without warrant, seized Mount Vernon arsenal and Forts Morgan and Gaines at Mobile, and had caused the banks to suspend, and he now asked to be justified in these usurpations. News arrived that Florida and Mississippi had seceded. Application was made for military help to seize Pensacola. In the midst of the excitement came telegrams of the firing on the *Star of the West* at Charleston, and its attending incidents.

Before these combined influences conservative resolves and combinations gave way, and an ordinance of immediate secession was prepared. The ubiquitous Yancey, fresh from his Northern disavowals of the "Scarlet Letter," was once more on hand in the rôle of leading conspirator, and came near "precipitating revolution" in the convention itself, by his flaming declamation. The "coöperationists" were pleading for delay, when he indiscreetly threatened the penalties of treason against any factious minority which should venture to disobey an ordinance of secession. The Northern members flared up under the taunt. "Will the gentlemen go into those sections of the State and hang all who are opposed to secession? Will he hang them by families, by neighborhoods, by counties, by congressional districts? Who, sir, will give the bloody order? . . . Are these to be the first-fruits of a Southern Republic?" "Coming at the head of any force

which he can muster," replied another member, "aided and assisted by the executive of this State, we will meet him at the foot of our mountains, and there with his own selected weapons, hand to hand, and face to face, settle the question of the sovereignty of the people."

The flurry was quieted, however, and the ordinance reported on the third day of the session. The conservatives endeavored to substitute a project of a slave-State convention, and a basis of settlement with the North, but it was voted down, 54 to 45. After this the radicals had easy sailing, and on January 11th the ordinance passed, 61 to 39. It is touching to read the expressions of regret, of doubt, of protest, with which the opposition members reluctantly gave in their adhesion, and parted from their government and their flag, under the final and fallacious promptings of State pride and the baneful heresy of paramount State allegiance. And this lingering sorrow of delegates was followed in many localities by the lingering condemnation and remonstrance of their constituents. Four weeks later Hon. Jere. Clemens wrote from Huntsville: "There is still much discontent here at the passage of the ordinance of secession, but it is growing weaker daily, and, unless something is done to stir it up anew, will soon die away"; adding, also, "Last week Yancey was burned in effigy in Limestone." But it was all of no avail; the people writhed helplessly in the toils of their false leaders.

The State of Georgia was then, and is still, regarded as the Empire State of the South. Her action, therefore, became an object of the greatest solicitude. Her leading men were known to be divided in sentiment. The North looked with some confidence there for a conservative reaction; but they were leaning on a broken reed. With all their asseverations of loyalty, the Unionists of that State were such only upon impossible conditions. "As a Union man," wrote B. H. Hill, in September, "I shall vote in November. As a Union man I shall hope for the right. As a Southern man I shall meet the enemy and go with my State." Stephens, equally unsound in his allegiance, was ultra-radical on slavery. He believed it the normal condition of the negro, and looked forward to its spread into every State of the Union. Supporting Douglas, he repudiated "Squatter Sovereignty." H. V. Johnson was an old-time "resistance" advocate. This kind of leadership was *quasi* disunion, especially under the assaults of aggressive and uncompromising revolutionists like Toombs, Iverson, Cobb, and Governor Brown.

Nevertheless, the popular voice, which some-

times restrains the rashness of leaders, was yet in doubt, and compelled a policy of slow approaches to insurrection. Governor Brown, therefore, in his message of November 8th, went only to the extent of recommending retaliatory legislation, and that the State should be armed. The vote at the presidential election had been: Breckinridge, 51,889; Bell, 42,886; Douglas, 11,590. The statutes required a majority vote for electors, hence there was no choice by the people. In conformity with law, the legislature was obliged to appoint them; and accordingly it chose (January 29th) a college favorable to Breckinridge. In the interim the legislature was convulsed with the topics of the hour. Stephens made a famous plea for union; Toombs an equally fervid harangue for disunion.

Meanwhile the members had listened to an insidious suggestion apparently midway between the two extremes. "The truth is, in my judgment," writes Stephens, "the wavering scale in Georgia was turned by a sentiment, the key-note to which was given in the words—'We can make better terms out of the Union than in it.' It was Mr. Thomas R. R. Cobb who gave utterance to this key-note in his speech before the legislature two days anterior to my address before the same body. This idea did more, in my opinion, in carrying the State out, than all the arguments and eloquence of all others combined." A formidable outside pressure in the shape of a military convention, and a large secession caucus was also organized and led by Governor Brown. The legislature could not resist the impetuous current. A military appropriation of one million dollars was made November 13th, and a convention bill passed on the 18th.

Perhaps the most hotly contested election campaign which occurred in any Southern State now took place for the convention, in the course of which fifty-two members of the legislature joined in a "coöperation" address, urging a conference of Southern States instead of immediate secession. The vote was cast January 2d, and, encouraged by apparent success, Governor Brown, on the following day, ordered the seizure of Fort Pulaski, and placed the telegraph under surveillance. The convention assembled at Milledgeville on January 16th, and the respective factions mustered their adherents for the combat. The struggle was short and decisive. In place of a brief and direct secession resolution the conservatives offered to substitute a proposition to hold a Southern conference at Atlanta, and setting forth certain "indispensable" amendments to the Constitution of the United States. It is almost needless to say they were exacting and advanced to a degree not yet suggested in

any quarter. The "Georgia platform," hitherto proclaimed by Mr. Stephens as his creed, was left far behind. That was a simple affirmation of the settlement of 1850. These new "guarantees" embraced provisions which would in practice have legalized slavery in the free States. There was no more hope that the North would accept them than that it would set up a monarchy. Radical as was this alternative, the straight-out secessionists would not even permit a vote to be taken upon it. The secession resolution was rushed through under the previous question, 166 yeas to 130 nays. On the following day an inquiry into the election for delegates was throttled with similar ferocity, 168 to 127. After this all opposition broke down, and on January 19th the secession ordinance was passed, 208 yeas to 89 nays. It was finally meekly signed by all the delegates but six, and even those promised their lives and fortunes to the cause. Governor Brown, on January 24th, set up the cap-sheaf of insurrection by sending six or seven hundred volunteers to demand and receive the surrender of the Augusta arsenal, declaring with sarcastic etiquette in his demand that "the State is not only at peace, but anxious to cultivate the most amicable relations with the United States Government."

The State of Louisiana followed in the main the action of the already mentioned cotton States except that it was somewhat more tardy. Her governor and her senators in Congress were as pronounced as the other principal conspirators, but her people as a whole were not yet quite so ripe for insurrection. "The State of Louisiana," wrote one of the secession emissaries, "from the fact that the Mississippi River flows through its extent and debouches through her borders, and that the great commercial depot of that river and its tributaries is the city of New Orleans, occupies a position somewhat more complicated than any other of the Southern States, and may present some cause of delay in the consummation and execution of the purpose of a separation from the North-western States, and the adoption of a new political status." Here as elsewhere, however, the executive sword was thrown into the vibrating scale. First, the governor's proclamation calling an extra session of the legislature to meet December 10th; then, on the plea of public danger, an appropriation to arm the State; next, on pretext of consulting public opinion, a convention bill; then, having volunteers, the seizure of Baton Rouge barracks and arsenal (January 10th) and Forts Jackson and St. Phillip (January 15th), and other Federal property; and then the terrorism of loud-mouthed revolution. When the convention

met, January 23d, its tide was already as irresistible as the waters of the Mississippi. A proposition for a slave-State conference was voted down, 106 to 24; another to "provide for a popular vote," defeated by 84 to 43, and on January 26th, some of the "coöperation" delegates having prudently silenced their scruples, the secession ordinance was passed, 113 yeas to 17 nays. Two exceptional incidents occurred in the action of Louisiana. One was the unanimous adoption of a resolution recognizing "the right of the free navigation of the Mississippi River and its tributaries by all friendly States bordering thereon," and also "the right of egress and ingress of the mouths of the Mississippi by all friendly States and powers." The other was that one of her Federal representatives, Hon. John E. Bouligny, remained true to his oath and his loyalty, and continued to hold his seat in Congress to the end of his term—the solitary instance from the cotton States.

It is a significant feature in the secession proceedings of the six cotton States which first took action, that their conventions in

every case neglected or refused to submit their ordinances of secession to a vote of the people for ratification or rejection. The whole spirit and all the phenomena of the movement forbade their doing so. From first to last the movement was forced, not spontaneous, official, not popular; and its leaders could not risk the period of doubt which a submission of the ordinances would involve, much less their rejection at the polls. To this general rule Texas, the seventh seceding State, forms an exception. Governor Houston opposed secession, and as long as possible thwarted the conspirators' plans. By a bolder usurpation than elsewhere, they nevertheless assembled an independent and entirely illegal convention, passed an ordinance of secession, February 1st, and held an election to ratify or reject it, February 23d. Long before this they had in substance joined the State to the rebel Confederacy, and the popular vote showed a nominal majority for secession, though the partial returns and the voting, amid a local revolution, afforded no trustworthy indication of a popular sentiment.

MY SHADOW.

UP and down it follows, follows,
I can never quite escape;
On the hills and in the hollows,
This familiar, silent shape
Still is with me, tireless ever;
Friend or foe—whoe'er I meet,
This companion leaves me never,
Keeping step with soundless feet.

Looking at it, I am lonely,
For a stranger still it seems;
Though it follows me—me only,
Yet, as something seen in dreams,
I behold it. Oft I wonder
Whither all its steps do tend;
All its features hidden under
Veils no changeful winds can rend.

Can no pain nor passion move thee,
O my comrade? I am tossed
By the tempests sent to prove me,—
On thy calm their wrath is lost.
Come thou near, my patient lover,
Let me whisper that I see—
What no other may discover—
Change at last has come to thee!

Once thy feet were swift beside me:
Not a hill too high to climb;
From the heat thou didst not hide thee,
Naught to thee were space and time;
Light as air, I saw thee dancing
Down the pathway where I strayed,—
Dost thou see the night advancing?
Art thou of the dark afraid?

Canst thou hear me, lover, stranger?
Silent shape, I tell thee now,
I, through safety and through danger,
Am become as changed as thou;
Yet my heart leaps on before me,
New stars burn within the sky;
Courage, courage! I implore thee,—
O my comrade, faster fly!

Ellen M. H. Gates.

WON.

BIRD, by her garden gate
Singing thy happy song,
Round thee the listening leaves
Joyously throng.
Tell them that yesternight
Under the stars so bright,
I wooed and won her!

Red rose, rejoice with me!
Swing all thy censers low,
Bid each fair bud of thine
Hasten to blow.
Lift every glowing cup
Brimming with sweetness up,
For — I have won her!

Wind, bear the tidings far,
Far over hill and dale;
Let every breeze that blows
Swell the glad tale.
River, go tell the sea,
Boundless and glad and free,
That I have won her!

Stars, ye who saw the blush
Steal o'er her lovely face,
When first her tender lips
Granted me grace,
Who can with her compare,
Queen of the maidens rare?
Yet — I have won her!

Sun, up yon azure height
Treading thy lofty way,
Ruler of sea and land,
King of the Day —
Where'er thy banners fly,
Who is so blest as I?
I — who have won her!

Oh, heart and soul of mine,
Make ye the temple clean,
Make all the cloisters pure,
Seen and unseen!
Bring fragrant balm and myrrh,
Make the shrine meet for her,
Now ye have won her!

Julia C. R. Dorr.

THE MADRIGAL.

ONCE, as I walked in woodlands green,
I chanced on Love where he sat alone
Catching the motes of the air, and sheen
From sunrays broken and downward thrown.

“What are you doing, Love?” quoth I —
For Love and I have been comrades true,
And I speak him freely when none are nigh,
And he answers me as he might not you!

“I am making a madrigal,” he said;
“I need but a rhyme to close it well”:
And, lo! it seemed that a spider’s thread
Glanced in the light and he caught its spell.

Wonderful, beautiful, rare, and sweet
It lay there, perfect, upon his hand:
It throbbed with a murmur, soft, complete —
I could not describe; I could understand!

“And how will you send it, Love?” quoth I.—
Ah, how he smiled! but he said no word;
But he beckoned me, and I followed, shy,
And we came on a Poet, all unheard.

There, as he dreamed, did Love bestow
The little song on his ear, content;
And so fled quickly that none might know
Where it was written and how it was sent!

Samuel Willoughby Duffield.

MRS. STOWE'S "UNCLE TOM" AT HOME IN KENTUCKY.

ON the outskirts of the towns of central Kentucky, a stranger, searching for the picturesque in architecture and in life, would find his attention arrested by certain dense masses of low frame and brick structures, and by the denser multitudes of strange human beings that inhabit them. A single town may have on its edges several of these settlements, which are themselves called "towns," and bear separate names either descriptive of some topographical peculiarity or taken from the original owners of the lots. It is in these that a great part of the negro population of Kentucky has congregated since the war. Here to-day live the slaves of the past with their descendants; old family servants from the once populous country-places; old wagon-drivers from the deep-rutted lanes; old wood-choppers from the slaughtered blue-grass forests; old harvesters and plowmen from the long since abandoned fields; old cooks from the savory, wasteful kitchens; old nurses from the softly rocked and softly sung-to cradles. Here, too, are the homes of the younger generation, of the laundresses and the barbers, teachers and ministers of the Gospel, coachmen and porters, restaurant-keepers and vagabonds, hands from the hemp factories, and workmen on the outlying farms.

You step easily from the verge of the white population to the confines of the black. But it is a great distance — like the crossing of a vast continent between the habitats of alien races. The air seems all at once to tan the cheek. Out of the cold, blue recesses of the midsummer sky the sun burns with a fierceness of heat that warps the shingles of the pointed roofs and flares with blinding brilliancy against some whitewashed wall. Perhaps in all the street no little cooling stretch of shade. The unpaved sidewalks and the roadway between are but undistinguishable parts of a common thoroughfare, along which every upspringing green thing is quickly trodden to death beneath the ubiquitous play and passing of many feet. Here and there, from some shielded nook or other coign of vantage, a single plummy branch of bitter dog-fennel may be seen spreading its small firmament of white and golden stars close to the ground; or be-

tween its pale green stalks the faint lavender of the nightshade will take the eye as the sole emblem of the flowering world.

A negro town! Looking out the doors and windows of the cabins, lounging in the doorways, leaning over the low frame fences, gathering into quickly forming, quickly dissolving groups in the dusty streets, they swarm, they are here from milk-white through all deepening shades to glossy blackness; octoroons, quadroons, mulattoes — some with large liquid black eyes, refined features, delicate forms! working, gossiping, higgling over prices around a vegetable cart, discussing last night's church festival, to-day's funeral, or next week's railway excursion, sleeping, planning how to get work and how to escape it. From some unseen old figure in flamboyant turban, bending over the washtub in the rear of a cabin, comes a crooned song of indescribable pathos; behind a half-closed front shutter, a Moorish-hued *amoroso* in gay linen thrums his banjo in a measure of ecstatic gayety, preluding the more passionate melodies of the coming night. Here a fight; there the sound of the fiddle and the rhythmic patting of hands. Tatters and silks flaunt themselves side by side. Dirt and cleanliness lie down together. Indolence goes hand in hand with thrift. Superstition dogs the slow footsteps of reason. Passion and self-control eye each other all day long across the narrow way. If there is anywhere resolute virtue, all round it is a weltered muck of low and sensual desire. One sees all the surviving types of old negro life here crowded together with and contrasted with all the new phases of "colored" life — sees the transitional stage of a race, part of whom were born slaves and are now freemen, part of whom have been born freemen but remain so much like slaves.

It cannot fail to happen, as you walk along, that you will come upon some cabin set back in a small yard and half hidden, front and side, by an almost tropical jungle of vines and multifarious foliage: patches of great sunflowers, never more leonine in tawny magnificence and sun-loving repose; festoons of white and purple morning-glories over the windows and up to the low eaves; around the porch and above the doorway, a trellis of gourd-vines swinging their long-necked, grotesque yellow fruit; about the entrance flaming hollyhocks and other brilliant bits of bloom, marigolds and petunias — evidences of the warm, native taste that still distinguishes

UNCLE TOM AT HOME.

the negro after some centuries of contact with the cold, chastened ideals of the Anglo-Saxon.

In the doorway of such a cabin, sheltered from the afternoon sun by his dense jungle of vines, but with a few rays of light glinting through the fluttering leaves across his seamed black face and white woolly head, the muscles of his once powerful arms shrunken, the gnarled hands folded idly in his lap,—his occupation gone,—you will haply see some old-

time slave of the class of Mrs. Stowe's Uncle Tom. For it is true that scattered here and there throughout the negro towns of Kentucky are representatives of the same class that furnished her with her hero; true, also, that they were never sold by their Kentucky masters to the plantations of the South, but remained unsold down to the last day of slavery.

When the war scattered the negroes of Kentucky blindly, tumultuously, hither and thither,

many of them gathered the members of their families about them and moved from the country into these "towns"; and here to-day the few survivors live, ready to testify of their relations with their former masters and mistresses, and indirectly serving to point a great moral: that, however justly Mrs. Stowe may have chosen one of their number as best fitted to show the fairest aspects of domestic slavery in

the United States, she departed from the common truth of history, as it respected their lot in life, when she condemned her Uncle Tom to his tragical fate. For it was not the *character* of Uncle Tom that she greatly idealized, as has been so often asserted; it was the category of events that were made to befall him.

As citizens of the American Republic, these old negroes—now known as "colored gentlemen," surrounded by "colored ladies and gentlemen"—have not done a great deal. The bud of liberty was ingrafted too late on the ancient slave-stock to bear much fruit. But they are unspeakably interesting, as contemporaries of a type of Kentucky negro whose virtues and whose sorrows, dramatically embodied in literature, have become a by-word throughout the civilized world. And now that the war-cloud is lifting from over the landscape of the past, so that it lies still clear to the eyes of those who were once the dwellers amid its scenes, it is perhaps a good time to scan it and note some of its great moral landmarks before it grows remoter and is finally hidden by the mists of forgetfulness.

II.

THESE three types—Mrs. Stowe's Uncle Tom, and the Shelbys, his master and mistress—were the outgrowth of natural and historic conditions peculiar to Ken-

tucky. "Perhaps," wrote Mrs. Stowe in her novel, "the mildest form of the system of slavery is to be seen in the State of Kentucky. The general prevalence of agricultural pursuits of a quiet and gradual nature, not requiring those periodic seasons of hurry and

pressure that are called for in the business of more Southern districts, makes the task of the negro a more healthful and reasonable one; while the master, content with a more gradual style of acquisition, had not those temptations to hard-heartedness which always overcome frail human nature, when the prospect of

sudden and rapid gain is weighed in the balance with no heavier counterpoise than the interests of the helpless and unprotected." These words contain many truths.

For it must not be forgotten, first of all, that the condition of the slave in Kentucky was measurably determined by certain physical laws which lay beyond the control of the most inhuman master. Consider the nature of the country—elevated, rolling, without miasmatic districts or fatal swamps; the soil in the main slaveholding portions of the State, easily tilled, abundantly yielding; the climate, temperate and invigorating. Consider the system of agriculture—not that of vast plantations, but of small farms, part of which regularly consisted of woodland and meadow that required little attention. Consider the further limitations to this system imposed by the range of the great Kentucky staples—it being in the nature of corn, wheat, hemp, and tobacco, not to yield profits sufficient to justify the employment of an immense predial force, nor to require seasons of forced and exhausting labor. It is evident that under such conditions slavery was not stamped with those sadder features which it wore beneath a devastating sun, amid unhealthy or sterile regions of country, and through the herding together of hundreds of slaves who had the outward but not the inward discipline of an army. True, one recalls here the often quoted words of Jefferson on the raising of tobacco—words nearly as often misapplied as quoted; for he was considering the condition of slaves who were unmercifully worked on exhausted lands by a certain proletarian type of master, who did not feed and clothe them. Only under such circumstances could the culture of this plant be described as "productive of infinite wretchedness," and those engaged in it as "in a continual state of exertion beyond the powers of nature to support." It was by reason of these physical facts that slavery in Kentucky assumed the

THE MASTER.

phase which is to be distinguished as domestic; and it was this mode that had prevailed at the North and made emancipation easy.

Furthermore, in all history the condition of an enslaved race under the enslaving one has been partly determined by the degree of moral justification with which the latter has regarded the subject of human bondage; and the life of the Kentucky negro, say in the days of Uncle Tom, was further modified by the body of laws which had crystallized as the sentiment of the people, slaveholders them-

selves. But even these laws were only a partial exponent of what that sentiment was; for some of the severest were practically a dead letter, and the clemency of the negro's treatment by the prevailing type of master made amends for the hard provisions of others.

It would be a most difficult thing to write the history of slavery in Kentucky. It is impossible to write a single page of it here. But it may be said that the conscience of the great body of the people was always sensitive touch-

ing the rightfulness of the institution. At the very outset it seems to have been recognized simply for the reason that the early settlers were emigrants from slaveholding States and brought their negroes with them. The commonwealth began its legislation on the subject in the face of an opposing sentiment. By early statute restriction was placed on the importation of slaves, and from the first they began to be emancipated. Throughout the seventy-five years of pro-slavery State-life, the general conscience was always troubled.

The churches took up the matter. Great preachers, whose names were influential beyond the State, denounced the system from the pulpit, pleaded for the humane and Christian treatment of slaves, advocated gradual emancipation. One religious body after another

proclaimed the moral evil of it, and urged that the young be taught and prepared as soon as possible for freedom. Antislavery publications and addresses, together with the bold words of great political leaders, acted as a further leaven in the mind of the slaveholding class. As evidence of this, when the new constitution of the State

was to be adopted, thirty thousand votes were cast in favor of an open clause in it, whereby gradual emancipation should become a law as soon as the majority of the citizens should deem it expedient for the peace of society; and these votes represented the richest, most intelligent slaveholders in the State.

In general the laws were perhaps the mildest. Some it is vital to the subject in hand not to pass over. If slaves were inhumanly treated by their owner or not supplied with proper food and clothing, they could be taken from him and sold to a better master. This law was not inoperative. I have in mind the instance of a family who lost their negroes in this way, were socially disgraced, and left their neighborhood. If the owner of a slave had bought him on condition of not selling him out of the county, or into the Southern States, or so as to separate him from his family, he could be sued for violation of contract. This law shows the opposition of the better class of Kentucky masters to the slave-trade, and their peculiar regard for the family ties of their negroes. In the earliest Kentucky newspapers

will be found advertisements of the sales of negroes, on condition that they would be bought and kept within the county, or the State. It was within chancery jurisdiction to prevent the separation of families. The case may be mentioned of a master who was tried by his church for unnecessarily separating a husband from his wife.

Sometimes slaves who had been liberated and had gone to Canada voluntarily returned into service under their former masters. Lest these should be overreached, they were to be taken aside and examined by the court to see that they understood the consequences of their own action, and were free from improper constraint. On the other hand, if a slave had a right to his freedom, he could file a bill in chancery and enforce his master's assent thereto.

But a clear distinction must be made between the mild view entertained by the Kentucky slaveholders regarding the system itself and their dislike of the agitators of forcible and immediate emancipation. A community of masters, themselves humane to their negroes and probably intending to liberate them in the end, would yet combine into a mob to put down individual or organized antislavery efforts, because they resented what they regarded an interference of the abolitionist with their own affairs, and believed his measures inexpedient for the peace of society. Therefore, the history of the antislavery movement in Kentucky, at times so turbulent, must not be used to show the sentiment of the people regarding slavery itself.

III.

FROM these general considerations it is now possible to enter more closely upon a study of the domestic life and relations of Uncle Tom and the Shelys.

"Whoever

THE MAMMY.

visits some estates there," wrote Mrs. Stowe, "and witnesses the good-humored indulgence of some masters and mistresses and the affectionate loyalty of some slaves, might be tempted to dream of the oft-fabled poetic legend of a patriarchal institution." Along with these words, taken from "Uncle Tom's Cabin," I should like to quote an extract from a letter written me by Mrs. Stowe under date of April 30th, 1886:

"In relation to your letter, I would say that I never lived in Kentucky, but spent many years in Cincinnati, which is separated from Kentucky only by the Ohio

River, which, as a shrewd politician remarked, was dry one-half the year and frozen the other. My father was president of a theological seminary at Walnut Hills, near Cincinnati, and with him I traveled and visited somewhat extensively in Kentucky, and there became acquainted with those excellent slaveholders delineated in 'Uncle Tom's Cabin.' I saw many counterparts of the Sheldons — people humane, conscientious, just, and generous, who regarded slavery as an evil and were anxiously considering their duties to the slave. But it was not till I had finally left the West, and my husband was settled as professor in Bowdoin College, Brunswick, Maine, that the passage of the fugitive-slave law and the distresses that followed it drew this from me."

The typical boy on a Kentucky farm was tenderly associated from infancy with the negroes of the household and the fields. His old black "Mammy" became almost his first mother and was but slowly crowded out of his conscience and his heart by the growing image of the true one. She had perhaps nursed him at her bosom when he was not long enough to stretch across it, sung over his cradle at

lane on blooded alder-stalk horses, afterwards leading the exhausted coursers into stables of the same green bushes and haltering them high with a cotton string. It was one of these hatless children of original Guinea that had crept up to him as he lay asleep in the summer grass and told him where the best hidden of all nests was to be found in a far fence corner,—that of the high-tempered, scolding

"ON BLOODED ALDER-STALK HORSES"

noon and at midnight, taken him out upon the velvety grass beneath the shade of the elm-trees to watch his first manly resolution of standing alone in the world and walking the vast distance of some inches. Often, in boyish years, when flying from the house with a loud appeal from the incomprehensible code of Anglo-Saxon punishment for small misdemeanors, he had run to those black arms and cried himself to sleep in the lap of African sympathy. As he grew older, alas! his first love grew faithless; and while "Mammy" was good enough in her way and sphere, his wandering affections settled humbly at the feet of another great functionary of the household,—the cook in the kitchen. To him her keys were as the keys to the kingdom of heaven, for his immortal soul was his immortal appetite. When he stood by the biscuit bench while she, pausing amid the varied industries that went into the preparation of an old-time Kentucky supper, made him marvelous geese of dough, with farinaceous feathers and genuine coffee-grains for eyes, there was to him no other artist in the world who possessed the secret of so commingling the useful with the beautiful.

The little half-naked imps, too, playing in the dirt like glossy blackbirds taking a bath of dust, were his sweetest, because perhaps his forbidden, companions. With them he went clandestinely to the fatal duck-pond in the stable lot, to learn the art of swimming on a walnut rail. With them he raced up and down the

guinea-hen. To them he showed his first Barlow knife; for them he blew his first home-made whistle. He is their petty tyrant to-day; to-morrow he will be their repentant friend, dividing with them his marbles and proposing a game of hop-sotch. Upon his dialect, his disposition, his whole character, is laid the ineffaceable impress of theirs, so that they pass into the final reckoning-up of his life here and in the world to come.

But Uncle Tom!—the negro overseer of the place—the greatest of all the negroes—greater even than the cook, when one is not hungry. How often has he straddled Uncle Tom's neck, or ridden behind him afield on a barebacked horse to the jingling music of the trace-chains! It is Uncle Tom who plaits his hempen whip and ties the cracker in a knot that will stay. It is Uncle Tom who brings him his first young squirrel to tame, the teeth of which are soon to be planted in his right forefinger. Many a time he slips out of the house to take his dinner or supper in the cabin with Uncle Tom; and during long winter evenings he loves to sit before those great roaring cabin fireplaces that throw their red and yellow lights over the half circle of black faces and on the mysteries of broom-making, chair-bottoming, and the cobbling of shoes. Like the child who listens to "Uncle Remus," he too hears songs and stories, and creeps back to the house with a wondering look in his eyes and a vague hush of spirit.

Then come school-days and vacations dur-

THE COOK.

ing which, as Mrs. Stowe says, he may teach Uncle Tom to make his letters on a slate or expound to him the Scriptures. Then, too, come early adventures with the gun, and 'coon hunts and 'possum hunts with the negroes under the round moon, with the long-eared, deep-voiced hounds—to him delicious and ever-memorable nights! The crisp air, through which the breath rises like white incense, the thick autumn leaves, begemmed with frost, rustling underfoot; the shadows of the mighty trees; the strained ear; the heart leaping with excitement; the negroes

and dogs mingling their wild delight in music that wakes the echoes of distant hillsides. Away! Away! mile after mile, hour after hour, to where the purple and golden persimmons hang low from the boughs, or where from topmost limbs the wild grape drops its countless clusters in a black cascade a sheer two hundred feet.

But now he is a boy no longer, but has his first love-affair, which sends a thrill through all those susceptible cabins; has his courtship, which gives rise to many a wink and innuendo; and brings home his bride, whose

coming converts every youngster into a living rolling ball on the ground, and opens the feasts and festivities of universal joy.

Then some day "ole Marster" dies, and the negroes, one by one, young and old, file into the darkened parlor to take a last look at his quiet face. He had his furious temper, "ole Marster" had, and his sins — which God forgive! To-day he will be buried, and to-morrow "young Marster" will inherit his saddle-horse and ride out into the fields.

Thus he has come into possession of his negroes. Among them are a few whose working days are over. These are to be kindly cared for, decently buried. Next are the active laborers, and, last, the generation of children. He knows them all by name, capacity, and disposition; is bound to them by lifelong associations; hears their communications and complaints. When he goes to town, he is charged with commissions, makes purchases with their own money. Continuing the course of his father, he sets about doing for them what is best under the circumstances, — making them capable, contented workmen. There shall be special training for special aptitude. One shall be made a blacksmith, a second a carpenter, a third a cobbler of shoes. In all the general industries of the farm, education shall not be lacking. It is claimed that a Kentucky negro invented the hemp-brake. As a result of this effective management, the Southern planter, looking northward, will pay him a handsome premium for the blue-grass slave. He will have no white overseer. He does not like the type of man. Besides, one is not needed. Uncle Tom served his father in this capacity; let him be.

Suppose, now, that among his negroes he finds a bad one. What shall he do with him? Keep him? Keeping him makes him worse, and moreover he corrupts the others. Set him free? That is to put a reward upon evil. Sell him to his neighbors? They don't want him. If they did, he wouldn't sell him to them. He sells him into the South. This is a statement, not an apology. Here, for a moment, one touches the terrible subject of the internal slave-trade. Negroes were sold from Kentucky into the Southern market because, as has just been said, they were bad, or by reason of the law of partible inheritance, or, as was the case with Mrs. Stowe's Uncle Tom, under constraint of debt. Of course, in many cases, they were sold wantonly and cruelly; but these, however many, were not enough to make the internal slave-trade more than an incidental and subordinate feature of the system. The belief that negroes in Kentucky were regularly bred and reared for the Southern market is a mistaken one. Mrs. Stowe

herself fell into the error of basing an argument for the prevalence of the slave-trade in this State upon the notion of exhausted lands, as the following passage from "The Key to 'Uncle Tom's Cabin'" shows:

"In Delaware, Maryland, Virginia, and Kentucky slave-labor long ago impoverished the soil almost beyond recovery and became entirely unprofitable."

Those words were written some thirty-five years ago and refer to a time long prior to that date. Now, the fact is that at least one-half the soil of Kentucky has never been under cultivation at all, and could not therefore have been exhausted by slave-labor. At least a half of the remainder, though cultivated ever since, is still not seriously exhausted; and of the small portion, a large share was always naturally poor, so that for this reason slave-labor was but little employed on it. The great slaveholding region of the State was the fertile region which has never been impoverished. I am sure that Mrs. Stowe will be glad to see her statement restricted in this way. To return from this digression, it may well be that the typical Kentucky farmer does not find among his negroes a single bad one; for in consequence of the early non-importation of slaves for barter or sale, and through long association with the household, they have been greatly elevated and humanized. If he must sell a good one, he will seek a buyer among his neighbors. He will even ask the negro to name his choice of a master and try to consummate his wish. No purchaser near by, he will mount his saddle-horse and look for one in the adjoining county. In this way the negroes of different estates and neighborhoods were commonly connected by kinship and intermarriage. How unjust to say that such a master did not feel affection for his slaves, anxiety for their happiness, sympathy with the evils inseparable from their condition. Let me cite the case of a Kentucky master who had failed. He could pay his debts by sacrificing his negroes or his farm, one or the other. To avoid separating the former, probably sending some of them South, he kept them in a body and sold his farm. Any one who knows the Kentuckian's love of land and home will know what this means. A few years, and the war left him without anything. Another case is more interesting still. A master, having failed, actually hurried his negroes off to Canada. Tried for defrauding his creditors, and that by slaveholding jurors, he was acquitted. The plea of his counsel, among other arguments, was the master's unwillingness to see his old and faithful servitors scattered and suffering. After emancipation, old farm hands sometimes refused to budge from their cabins. Their

former masters paid them for their services as long as they could work, and supported them when helpless. I have in mind an instance where a man, having left Kentucky, sent back hundreds of dollars to an aged, needy domestic, though himself far from rich; and another case where a man still contributes annually to the maintenance of those who ceased to work for him the quarter of a century ago.

The good in human nature is irrepressible. Slavery, evil as it was, when looked at from the telescopic remoteness of human history as it is to be, will be adjudged an institution that gave development, on the side of virtue, to certain very noble types of character. Along with other social forces peculiar to the age, it produced in Kentucky a kind of gentleman farmer, the like of which will never appear again. He had the aristocratic virtues: highest notions of personal liberty and personal honor, a fine especial scorn of anything that was mean, little, cowardly. As an agriculturist he was not driving or merciless or grasping; for the rapid amassing of wealth was not among his passions, and the contention of splendid living was not among his thorns. To a certain carelessness of riches he added a certain profuseness of expenditure; and indulgent toward his own pleasures, toward others, his equals or dependents, he bore himself with a spirit of ready kindness and proud magnanimity. Intolerant of tyranny, he was in turn no tyrant. To say of such a man, as Jefferson said of every slaveholder, that he lived in perpetual exercise of the most boisterous passions and unremitting despotism, and in the exaction of the most degrading submission, was to pronounce a judgment hasty and unfair. Rather did Mrs. Stowe, while not blind to his faults, discern his virtues when she made him, embarrassed by debt, exclaim: "If anybody had said to me that I should sell Tom down South to one of those rascally traders, I should have said, 'Is thy servant a dog that he should do this thing?'"

IV.

But there was another person who, more than the master, sustained close relationship to the negro life of the household,—the mistress. In the person of Mrs. Shelby Mrs. Stowe described some of the best traits of a Kentucky woman of the time; but perhaps only a Southern woman herself could do full justice to a character which many duties and many burdens endued with extraordinary strength and varied efficiency.

She was mistress of distinct realms—the house and the cabins—and the guardian of the bonds between the two, which were always troublesome, often delicate, sometimes distressing. In those cabins were nearly always

some poor creatures needing sympathy and watch-care: the superannuated mothers helpless with babes, babes helpless without mothers, the sick, perhaps the idiotic. Apparel must be had for all. Standing in her doorway and pointing to the meadow, she must be able to say in the words of a housewife of the period, "There are the sheep; now get your clothes." Some must be taught to keep the spindle and the loom going; others trained for dairy, laundry, kitchen, dining-room; others yet taught fine needlework. Upon her falls the labor of private instruction and moral exhortation, for the teaching of negroes was not forbidden in Kentucky. She must remind them that their marriage vows are holy and binding; must interpose between mothers and their cruel punishment of their own offspring. What is hardest of all, she must herself punish for lying, theft, immorality. Her own children, too, must be guarded against temptation and corrupting influences. In her life there is no cessation of this care: it renews itself daily, year in and year out. Beneath every other trouble is the secret conviction that she has no right to enslave these creatures, and that, however improved their condition, this life is one of great and necessary evils. Mrs. Stowe well makes her say: "I have tried—tried most faithfully as a Christian woman should—to do my duty toward these poor, simple, dependent creatures. I have cared for them, instructed them, watched over them, and known all their little cares and joys for years. . . . I have taught them the duties of the family, of parent and child, and husband and wife. . . . I thought by kindness and care and instruction, I could make the condition of mind better than freedom." So sorely overburdened and heroic mold of woman! Fulfilling each day a round of intricate duties, rising at any hour of the night to give medicine to the sick, liable at any time, in addition to the cares of her great household, to see an entire family of acquaintances arriving unannounced, with trunks and servants of their own, for a visit protracted in accordance with the large hospitalities of the time,—what wonder if, from sheer inability to do all things herself, she trains her negroes to different posts of honor, so that the black cook finally expels her from her own kitchen and rules over that realm as an autocrat of unquestioned prerogatives?

Mistresses of this kind had material reward in the trusty adherence of their servants during the war. Their relations throughout this period—so well calculated to try the loyalty of the African nature—would of themselves make up a volume of the most touching incidents. Even to-day one will find in many Kentucky households survivals of the old

THE MISTRESS.

order — find "Aunt Chloe" ruling as a despot in the kitchen, and making her will the pivotal point of the whole domestic system. I have spent nights with a great Kentuckian, self-willed and high-spirited, whose occasional refusals to rise for a half-past five o'clock breakfast always brought the cook from the kitchen up to his bedroom, where she delivered her commands in a voice worthy of Catherine the Great. "We shall have to get up," he would say, "or there'll be a row!" One may yet see, also, old negroes setting out for an annual or a semi-annual visit to their

former mistresses, and bearing some offering, — a basket of fruits or flowers. I should like to mention the case of one who died after the war and left her two children to her mistress, to be reared and educated. The troublesome and expensive charge was taken and faithfully executed.

Here, in the hard realities of daily life, here is where the crushing burden of slavery fell, — on the women of the South. History has yet to do justice to the noblest type of them, whether in Kentucky or elsewhere. In view of what they accomplished, despite the difficulties in their way, there is nothing they have

found harder to forgive in the women of the North than the failure to sympathize with them in the struggles and sorrows of their lot, and to realize that *they* were the real practical philanthropists of the negro race.

BUT as is the master, so is the slave, and it is through the characters of the Sheldons that we must approach that of Uncle Tom. For of all races, the African — superstitious, indolent, singing and dancing, most impressionable creature — depended upon others for

of lard, naming the thief and the hiding-place. "Say not a word about it," replied his master. The next day he rode out into the field where the culprit was plowing, and, getting down, walked along beside him. "What's the matter, William?" he asked after a while; "you can't look me in the face as usual." William burst into tears, and confessed everything. "Come to-night, and I will arrange so that you can put the lard back and nobody will ever know you took it." The only punishment was a little moral teaching; but

CHASING THE RAFFI

enlightenment, training, and happiness. If, therefore, you find him so intelligent that he may be sent on important business commissions, so honest that he may be trusted with money, house, and home, so loyal that he will not seize opportunity to become free; if you find him endowed with the manly virtues of dignity and self-respect united to the Christian virtues of humility, long-suffering, and forgiveness, then do not, in marveling at him on these accounts, quite forget his master and his mistress, — they made him what he was. And it is something to be said on their behalf, that in their household was developed a type of slave that could be set upon a sublime moral pinnacle to attract the admiration of the world.

Attention is fixed on Uncle Tom first as head-servant of the farm. In a small work on slavery in Kentucky by George Harris, it is stated that masters chose the cruelest of their negroes for this office. It is not true, exceptions allowed for. The work would not be worth mentioning, had not so many people at the North believed it. The amusing thing is, they believed Mrs. Stowe also. But if Mrs. Stowe's account of slavery in Kentucky is true, the other is not. But those who have been able to accept both would not care, of course, to be restricted to one.

It is true that Uncle Tom inspired the other negroes with some degree of fear. He was censor of morals, and reported derelictions of the lazy, the destructive, and the thievish. For instance, an Uncle Tom on one occasion told his master of the stealing of a keg

the Uncle Tom in the case, though he kept his secret, looked for some days as though the dignity of his office had not been suitably upheld.

It was "Uncle Tom's" duty to get the others off to work in the morning. In the fields he did not drive the work, but led it — being a master worker — led the cradles and the reaping-hooks, the hemp-breaking and the corn-shucking. The spirit of happy music went with the workers. They were not goaded through their daily tasks by the spur of pitiless husbandry. Nothing was more common than their voluntary contests of skill and power. My recollection reaches only to the last two or three years of slavery; but I remember the excitement with which I witnessed some of these hard-fought battles of the negroes. Rival hemp-breakers of the neighborhood, meeting in the same field, would slip out long before breakfast and sometimes never stop for dinner. So it was with cradling, corn-shucking, or corn-cutting — in all work where rivalries were possible. No doubt there were other motives. So much was a day's task; for all over there was extra pay. A capital hand, by often performing double or treble the required amount, would clear a neat profit in a season. The days of severest labor fell naturally in harvest-time. But then intervals of rest in the shade were commonly given; and milk, coffee, or, when the prejudice of the master did not prevent (which was not often!), whisky was distributed between meal-times. As a rule they worked without hurry. De Tocqueville gave unintentional testimony to a

THE PREACHER.

Sumner was in Kentucky, he saw with almost incredulous eyes the comfortable cabins with their flowers and poultry, the fruitful truck-patches, and a genuine Uncle Tom — “a black gentleman with his own watch!” Well enough does Mrs. Stowe put these words into her hero’s mouth, when he hears he is to be sold: “I’m feared things will be kinder goin’ to rack when I’m gone. Mas’r can’t be ‘spected to be a-pryin’ round everywhere as I’ve done, a-keepin’ up all the ends. The boys means well, but they’s powerful car’less.”

More interesting is Uncle Tom’s character as a preacher. Contemporary with him in Kentucky was a class of men among his people who exhorted, held prayer-meetings in the cabins and baptizings in the woods, performed marriage ceremonies, and enjoyed great freedom of movement. There was one in nearly every neighborhood, and all together they wrought effectively in the moral development of their race.

I have nothing to say

characteristic of slavery in Kentucky when he described the negroes as “loitering” in the fields. On one occasion all the hands dropped work to run after a rabbit the dogs had started. A passer-by indignantly reported the fact at headquarters. “Sir,” said the old gentleman, with a hot face, “I’d have whipped the last damn rascal of ‘em if they *hadn’t* run ‘im!”

The negroes made money also off their truck-patches, in which they raised for sale melons, broom-corn, vegetables. When Charles

here touching the vast and sublime conception which Mrs. Stowe formed of “Uncle Tom’s” spiritual nature. But certainly no idealized manifestation of it is better than this simple occurrence: One of these negro preachers was allowed by his master to fill a distant appointment. Belated once, and returning homeward after the hour forbidden for slaves to be abroad, he was caught by the patrol and cruelly whipped. As the blows fell, his only words were: “Jesus Christ suffered for righteousness’

sake; so kin I." Another of them was recommended for deacon's orders and actually ordained. When liberty came, he refused to be free, and continued to work in his master's family till his death. With considerable knowledge of the Bible and a fluent tongue, he would nevertheless sometimes grow confused and lose his train of thought.

At these embarrassing junctures it was his wont suddenly to call out at the top of his voice, "Saul! Saul! why persecutest thou me?" The effect upon his hearers was electrifying; and as none but a very highly favored being could be thought worthy of enjoying this persecution, he thus converted his loss of mind into spiritual reputation. A third, named Peter Cotton, united the vocations of exhorter and wood-chopper. He united them literally, for one moment Peter might be seen standing on his log chopping away, and the next kneeling down beside it praying. He got his mistress to make him a long jeans coat and on the ample tails of it to embroider, by his direction, sundry texts of Scripture, such as: "Come unto me, all ye that are heavy laden!" Thus literally clothed with righteousness, Peter went from cabin to cabin preaching the Word. Well for him if that other Peter could have seen him! The apostle might have felt proud to go along.

These men sometimes made a pathetic addition to their marriage ceremonies: "Until death or *our higher powers* do you separate!"

Another typical contemporary of Uncle Tom's was the negro-fiddler. It should be

remembered that before he hears he is to be sold South. Uncle Tom is pictured as a light-hearted creature, capering and dancing in his cabin. There was no lack of music in those cabins. The banjo was played, but more commonly the fiddle. A home-made variety

THE FIDDLER

of the former consisted of a crook-necked, hard-shell gourd and a piece of sheep-skin. There were sometimes other instruments,—the flageolet and the triangle. I have heard of a kettle-drum's being made of a copper still. (A Kentucky negro carried through the war as an osseous tambourine the skull of a mule, the rattling teeth being secured in the jaw-bones.) Of course the bones were everywhere. Negro music on one or more instruments was in the highest vogue at the house. The young Ken-

tuckians often used it on serenading bravuras. The old fiddler, most of all, was held in reverent esteem and met with the gracious treatment of the ancient minstrel in feudal halls. At parties and weddings, at picnics in the summer woods, he was the soul of melody, and with an eye to the high demands upon his art, he widened his range of selections and perfected according to native standards his inimitable technique. The deep, tender, pure

you to-day the same assurance. Nay, it is an awkward discovery to make, that some of them still cherish resentment toward agitators who came secretly among them, fomented discontent, and led them away from homes to which they afterwards returned. And I want to state here, for no other reason than that of making an historic contribution to the study of the human mind and passions, that a man's views of slavery in those days did not always deter-

mine his treatment of his slaves. The only case of mutiny and stampede that I have been able to discover in a certain part of Kentucky, took place among the negroes of a man who was known as an outspoken emancipationist. He pleaded for the freedom of the negro, but in the mean time worked him at home with the chain round his neck and the ball resting on his plow.

Christmas was, of course, the time of holiday merry-making, and the "Ketchin' marster an' mistiss Christmas gif'" was a great feature. One morning an aged couple presented themselves.

"Well, what do you want for your Christmas gift?"

"Freedom! Mistiss."

"Freedom! Haven't you been as good as free for the last ten years?"

"Yaas, mistiss; but — freedom mighty sweet!"

"Then take your freedom!"

The only method of celebrating the boon was the moving into a cabin on the neighboring farm of their mistress's aunt and being freely supported there as

SAVING HIS MASTER.

feeling in the song "Old Kentucky Home" is a true historic interpretation.

It is wide of the mark to suppose that on such a farm as that of the Shelys the negroes were in a perpetual frenzy of discontent or felt any burning desire for freedom. It is difficult to reach a true general conclusion on this delicate subject. But it must go for something that even the Kentucky abolitionists of those days will tell you that well-treated negroes cared not a snap for liberty. Negroes themselves, and very intelligent ones, will give

they had been freely supported at home!

Mrs. Stowe has said, "There is nothing picturesque or beautiful in the family attachment of old servants, which is not to be found in countries where these servants are legally free." On the contrary, a volume of incidents might readily be gathered, the picturesqueness and beauty of which are due so largely, if not wholly, to the fact that the negroes were not free servants, but slaves. Indeed, many could never have happened at all but in this relationship. I cite the case of an old negro who was

buying his freedom from his master, who continued to make payments during the war, and made the final one at the time of General Kirby Smith's invasion of Kentucky. After he had paid him the uttermost farthing, he told him that if he should ever be a slave again, he wanted him for his master. Less to the point, but too good to leave out, is the case of an old negress who had been allowed to accumulate considerable property. At her death she willed it to her young master instead of to her sons, as she would have been allowed to do. But the war! what is to be said of the part the negro took in that? Is there in the drama of all humanity a figure more picturesque or more pathetic than the figure of the African slave, as he followed his master to the battle-field, marched and hungered and thirsted with him, served and cheered and nursed him,—that master who was fighting to keep him in slavery? Instances are too many; but the one may be mentioned of a Kentucky negro who followed his young master into the Southern army, staid with him till he fell on the field, lay hid out in the bushes a week, and finally, after a long time and many hardships, got back to his mistress in Kentucky, bringing his dead master's horse and purse and trinkets. This subject comprises a whole vast field of its own; and if the history of it is ever written, it will

be written in the literature of the South, for there alone lies the knowledge and *the love*.

It is only through a clear view of the peculiar features of slavery in Kentucky before the war that one can understand the general status of the negroes of Kentucky at the present time. Perhaps in no other State has the race made less endeavor to push itself into equality with the white. This fact must be explained as in part resulting from the conservative ideals of Kentucky life in general. But it is more largely due to the influences of a system which, though no longer in vogue, is still remembered, still powerful to rule the minds of a naturally submissive and most susceptible people. The kind, even affectionate, relations of the races under the old régime have continued with so little interruption that the blacks remain content with their inferiority, and lazily drift through life. I venture to make the statement, that wherever they have attempted most to enforce their new-born rights, they have either, on the one hand, been encouraged to do so, or have, on the other, been driven to self-assertion by harsh treatment. But treat them always kindly and always as hopelessly inferior beings, and they will do least for themselves. This, it is believed, is the key-note to the situation in Kentucky; and the statement is made as a fact, not as an argument.

James Lane Allen.

HAND-CAR 412. C. P. R.

(ON THE CANADIAN PACIFIC RAILWAY.)

FOR the last hour the construction train had been traveling slowly; for a whole hour it had cautiously stumbled over the loosened fish-plates with a monotonous chug-gety-chug, chunkety-chunk that had long ceased to awaken any interest, sympathetic or otherwise, in our drowsy minds. Finally it stopped altogether with a jerk, as if it had suddenly but conclusively realized the vanity of any further effort. The astonished cars pulled at their pins and pounded their buffers as if in angry expostulation at this freak of the locomotive, and some of the men offered energetic advice to the Deity as to what ultimate course to pursue with the management of the road in general and the long freight-links in particular. "Can't help it, can't help it!" said the brakeman as he came along the top of the box-car ahead. "The rails have spread, and it'll be two hours, may be three, before we start her up again."

But the time passed, the train still waited, and we began to grumble stoutly, wondering

why, in the name of various places and things, they chose to dally in such a dismal, god-forsaken spot. It was raining at Rat Crossing; in fact it had been raining slowly, steadily, for two days with a certain desperate pertinacity. There had been no previous drought to render such an abundance of water desirable; in the country through which we passed we had noticed no fields of parched wheat, no withering trees, no drooping vegetables, no thirsty cattle, no traveled roads on which the dust required laying. On the contrary, the lakes were all full to overflowing, the rivers swollen, the ravines drowned, the swamps soaked, and the tanks so full that the relief-pipes poured forth a continuous stream of spattering expostulation.

Notwithstanding this lavish excess of water the air seemed no fresher than before the storm, when the thermometer in the caboose registered 97 degrees on the shady side of the track. Both front and side doors were wide open, and some of the boys, in a vain endeavor to produce a passing sensation of freshness, sat down in the semi-fluid puddles, covered with a film of cin-

THROUGH THE FLAMES.

ders, and dangled their legs in the pour outside. But to no purpose; the air was dead, the water warm, and we continued to stifle and growl.

The view from the car was not interesting. To the left, as far as we could see through the endless, unfolding curtain of rain, a dismal muskeg swamp stretched away to the south of the track, broken only by rare clumps of ragged tamarack. Both slopes of the bank were covered by long beds of pink fire-weed varied with patches of soggy pigeon-grass, and to the north lay the desolate waste of *brulé* through which we had been traveling for interminable hours. Here and there among the shiny black poles of the burnt trees little bunches of "popples" rustled their loose leaves with a nervous activity that seemed out of place in the dead quiet of their surroundings, and their silly, feeble fluttering, like the barking of a frightened cur, was so exasperating that we could scarcely refrain from throwing a stone at the shivering things and calling out: "Oh, shut up!"

The underbrush was thin, and the ridges of pink gneiss, banded with black, thrust their bare, smooth surfaces through the mottled moss like great pock-marked shoulders of giants protruding from their tattered shirts; in the gullies

between them the water gurgled dismally below the tangle of dead trees, and ran away under glossy pigeon-berry leaves, on to which the grotesque pitcher-plants, opening wide their lids, poured their surplus water. Save by the patter of the rain on the car-top and the pish-pishing of the engine blowing off steam, the silence was absolute, and rendered only more profound by the booming crash of a falling tree. Nothing moved but the crazy poplar-trees, and once more we marveled at the recklessness of the men who had built a railroad through this dead, barren wilderness where there was nothing but rock, water, and burnt timber.

Besides our party of engineers, detailed on remeasurement work, there were two strangers in the car; they had blank passes from the chief and were going West; as they kept to themselves, talking together most of the time and not seeming to care for our company, we had paid no especial attention to them. Every man of us, however, turned suddenly as the younger of the two, speaking excitedly in a loud, swaggering tone intensified by a strong twang, said to his companion:

"I tell you, Morton, that man Matt Murphy was the biggest coward that ever walked this earth; now don't you forget it!"

The intonation of the man's voice was so vicious, so mean, that we all felt convinced that the statement was false, and, although utterly ignorant of the facts, each of us felt an instinctive desire to contradict him. But before any one could think of what to say, a deep voice from the end of the car condensed our feelings in the energetic and laconic answer: "That's a — hell!"

The speaker, Jack Collins, was the quietest man on the staff, and had acquired a certain reputation for minding nobody's business but his own. Jack was somewhat of an enigma to us all; we did not understand, but we all liked him, for he had a way of doing small chores and helping the boys in a pinch that showed a truly good nature and a warm heart. What his exact work was none of us knew; he had the name of being a good locator and explorer, especially among the older men, with whom he usually associated; his reports never passed through our office, and no complaints were ever made about the irregularity of his work; he always went off before office-hours with his compass and note-book, but the men not infrequently found him lying in a secluded corner reading, or sleeping with his book beside him. He was a large, powerful fellow, with a heavy beard that concealed half his face, of which the only remarkable features were a strong, determined mouth and long, slanting black eyes that kept moving slowly round from left to right and suddenly jumped back to their starting-point. Sometimes, when we pressed him very hard, he told us a story or some adventure which had happened to him, and it was only then that his eyes were at rest, void of expression, as if he were reading from some far-away book. He spoke slowly but well, in a low, even voice that commanded the attention of his hearers; we never questioned the truth of his stories, and whenever any statement seemed a trifle extravagant we acknowledged that it must be our fault if we could not understand the circumstances.

For a moment after his unusually emphatic denial no one spoke; the stranger had risen at once, but seeing that Jack did not move he sat down again, filled a fresh pipe, and waited. Jack was sitting on the floor at the end of the car looking down pensively at the revolver that hung from his belt; after a short pause he looked up at the ceiling, and in his usual slow way he told us the story of Matt Murphy's last work on the road.

It had happened two years before; Murphy was then road-master at Campbell's Point, and far from being thought a coward, he was looked upon as the only man on the line who had pluck enough to run a snow-plow at the head of five engines into a choked cut, and

stand firm when every plank fairly quivered under the strain. One day, while he was dozing in his office, for Matt was lazy when he had nothing to do, the door opened with a bang, and the operator, in a state of breathless excitement, ran into the room.

"There's a bush-fire below the long bridge, Mr. Murphy," he called out; "the wind is this way, and the Pacific Emigrant is due in an hour. What the devil shall we do?"

Matt started in his chair and repeated the man's words in a dazed sort of way. "Bush-fire—and they are due in an hour. My God!" Then he got up, staggered across the room, and leaned against the wall. The baggage-master, who had overheard, stepped in from the adjoining office, and the operator with a shrug of his shoulders turned to him and said in a perplexed way:

"Murphy's drunk as usual!—what's to be done?"

"Drunk, you blamed idiot!" cried Nolan indignantly; "his wife and kids are on that train. Get out of here, you scented squirrel, and blamed quick too, or I'll make your empty head so blessed sore you couldn't see daylight through a ladder! Say, Matt, old man——" He did not finish his sentence, for the next moment Murphy pushed him aside and sprang out on the platform where the men were collecting to hear the news.

"Boys," he cried in a voice that seemed to rasp in his throat, "boys, look a-here! I want three good men to go to hell with me! Haul up a pumper—412! catch a hold there; now heave away—so! Drop her on the track—that's it! Slap on the oil, you fellows. Two hundred lives! My God!" he continued as if thinking aloud. "Quick, blame you! off with your shirts and hurry! all aboard! That's the style; now come along, boys, and *work!*"

He was the first on the car and took the rear handle behind the brake; Long Mike the Finlander, Jim Reeves, and "Dumb Dick" jumped on after him; an oil-can, a monkey-wrench, and an axe were thrown on; the men gave them a shove to start, and away they went down the long grade, fifteen miles an hour.

Instinctively,—for they merely knew that there was a fire below the bridge and that the train was soon due,—instinctively Murphy's three companions had understood what they had before them. They were all old hands and knew that this was a desperate venture, a forlorn-hope, and that their only chance of success lay in their working well together, each man doing his duty absolutely, regardless of what might happen. But all this they felt rather than reasoned, for men of action reflect slowly, and the pace was so severe that they had no time for reflection.

Matt leaned over and slipped the key of the switch to Jim Reeves, who was in front.

"If we haven't time to unlock her, Jim," he said so quietly that it hurt the men to hear him, "jump on the lever and break the chain. Now, fellows, heave away for all you're worth."

The first six miles passed quickly; to right and left the road and the trees flew backwards, and nothing was heard but the short, quick panting of the men, the burr of the cogs, and the clickety-click, clickety-click of the wheels over the fish-plates. On the half-mile up-grade to Bass' Falls they had to slacken up a little and hang on the handles, while the sweat ran off their smooth backs down over their muscular arms to the crossbar and dripped off on to the platform; but with their heads down and every muscle braced, they worked on steadily, panting hoarsely through their closed teeth. They had but one idea in common, and that was, as Jim Reeves tersely expressed it, that they must reach that qualified switch or bust. At regular intervals Murphy, who seemed to have renounced his customary profanity, repeated his short, earnest exhortation, more as a prayer than as a command: "Steady, boys, steady! for God's sake!"

The top of the grade was reached; then came a level run of two miles before the curve to the bridge. Ahead of them on each side of the track the workmen, apprehending some disaster from the enormous volume of smoke that was blowing toward them in purplish clouds rimmed with golden sunlight, had assembled before the Falls' station; and as Murphy's gang came along, up and down, up and down, every man in that crowd felt his eyes grow moist and his throat dry. With one accord English and Yankee, French-Canadians and Italians, Swedes and Finlanders, gave one solitary ringing cheer, and stood silent again, as if suddenly awed by the simple heroism of these four men, apparently rushing consciously, determinedly to certain death, and working fiercely as if they were escaping from some great danger instead of hurrying into it. Not a man spoke as they flashed past. A few pushed their hats back and stopped as if ashamed of the movement, watching the hand-car grow smaller and smaller above the converging lines of the rails.

Swearing Dan Dunn, the walking boss, stepped out into the middle of the track between his men, threw down his pick, and wiped his wet forehead on the sleeve of his shirt.

"Boys," he said, "that gang's a-goin' to everlastin' destruction as plucky as any fellows I ever see, every blamed man of them, and I'll bet a barrel of high-wines to a cup of tea they know it too. Matt Murphy knows it, sure."

Then, turning suddenly and pointing down the track, he cried in his usual bullying tone:

"Give them a yell there, blame you,—all together now, and yell till you bust, or I'll break the son of tadger's head that hangs fire."

For once, although they had their customary effect of insuring prompt compliance with his orders, Dan's threats were superfluous; for once his wishes coincided with the wishes of his men, and from those five hundred throats there burst such a cry that the flames ahead seemed to halt for a moment in their forward rush. On the hot, pulsating air it floated away across the muskeg, over the heads of the devoted crew, and reëchoed with a booming roll from the slate walls of the rock cut through which they pushed their car. But though this expression of their comrades' sympathy cheered and helped them, it told each man only too plainly that this was his last job on the track.

"That's good-bye for the long contract," said Reeves, and Mike in his broken English repeated:

"Yas! Koot-pye, pyes,—koot-pye!" but both relapsed into silence at the sound of Murphy's quiet remonstrance.

"Steady, boys, steady! and mind the brake, Jim; we're right on the down-grade."

At the end of the level was the grade to the bridge and the fire; beyond the fire the bridge, the switch, and the fated train with its human cargo hurrying to destruction, for the wind was high, and the engineer would naturally think the fire far away until he was in the very midst of it. Then the struggle began. The smoke ran along the embankment towards them in great flying gusts, so dense they could barely see the platform of the car; the heat became intense, but they never wavered. Perhaps it was because women were few in the dismal country which had become their home, and that, as is usual in purely male communities, every man invested the gentler sex collectively with a romantic halo, in exact inverse proportion to the profane skeptical contempt which he professed for them individually; perhaps it was because some lingering spark of chivalry, driven into the West by the sneers of a higher civilization, had flamed up suddenly in the hearts of these rough journeymen; or perhaps it was merely the humane hope of saving the wives and children of men who had slept under the same blanket, worked in the same ditch, and shared the same biscuit;—but, whatever the cause, it was sufficient to silence selfish consideration and make them look upon the sacrifice of their lives as no more than the fulfillment of a necessary duty.

All around them the trees were falling in rows; broad flashes of flame, quenched for a

moment in the black smoke, burst up and flared in the wind like shreds of some vast tattered canopy. Along the ground the brush wilted away, burning with a sharp crackle like that of a musketry discharge; and up through the hollow tamaracks the fire swept with a noise like the bellow of a filling sail. Great trunks tottered and fell with a booming crash like the sound of distant cannon. The hot air quivered around them, and they gasped spasmodically as they shook off the burning sparks and laughed hysterically between short howls of pain. Ahead all was red and black, a sea of fire. Murphy called out once more, "Steady, boys, steady!" and they plunged into it resolutely, with the desperation of a wounded bull charging on the espada's blade.

"Steady, my men! up and down, up and down! stick to her, lads; it'll soon be over now."

Then the flames closed upon them, and as they lowered their heads before the whirlwind of fire and smoke that was hurled at them, they shivered at the crisp crepitation of their hair and beard, and felt the hot grip of the fire fasten on them as they writhed in pain. Something struck the car and it reeled for a moment.

"Stand by her, boys; steady there!" They grasped the handles again and struggled on; by the hollow sound of the wheels they knew that they were on the bridge at last, and it lent them fresh strength. Then something struck them again. "Hard, hard at work there! Jun, Mike, Dick, all of you!—pump away, for God's sake, boys! we are nearly there. Try again! the switch, boys, mind the switch! all together now, heave!" But strain as they might,—and they strained with a fierce, desperate energy, for there was something in Murphy's tone that went to their hearts,—the car was fast and would not move. Then they heard a wild cry above the thundering crash of the bridge as it fell from under them; the car was suddenly shot ahead and sprang away easily over the debris that lay across the iron. The trestle was passed; but at the rear handle Mike stood alone; his partner, Matt Murphy, was gone; that last falling brace had struck him squarely across the arms, and when he saw that he could no longer pull his weight, he jumped off and put all his remaining strength in that last push that sent them through into the comparative quiet beyond.

"Steady, boys, and God be with you!" came once more from out the chaos of flames behind them, and that was all. On the other side, beyond the clay cut, they heard the bel-

lowing whistle of the engine; a few more strokes, and they reached the switch.

"Jump, Jim, for God's sake, jump quick!" The next moment the train swept round the curve over the frog and glided smoothly down the siding, where it stopped; but the hand-car had disappeared.

When they came back they found Jim Reeves's body by the broken lever of the switch; Long Mike too they picked up beside him, with a shattered leg and an ugly gash across the forehead, while on the other side of the track "Dumb Dick" was clutching the broken handle of the hand-car and sobbing like a child. Strong men lifted their crushed bodies with tender care, and side by side they laid them on a bed of fragrant balsam boughs; a woman's light hand wiped away the blood from Mike's rough face and held moist linen to his bleeding brow. Soon he opened his eyes and looked solemnly, with a puzzled expression, into the anxious faces of the women and children that stood around him, silently watching for his recovery. Then he remembered all; for a moment a bright smile lit up his plain features and died away slowly as he caught sight of his companions stretched beside him. Coming through the distant smoke the rays of the red evening sun touched their pale faces with a ruddy glow and wove a soft golden halo around their passive heads. With a slight quiver Long Mike passed away in the sunset silence to join his comrades.

When Jack finished there was a pause; then we all looked up at him with the same question on our lips. He rose slowly from the corner in which he had been sitting. "You want to know where I heard all this?" he asked. "Oh! I am 'Dumb Dick.' To be frank with you, boys, I have been a special detective on the C. P. R. for several years, and if I tell you so now it is because my contract is up as soon as I have handcuffed Mr. James Bowles over there. Don't you move!" he called out, covering him with his revolver. "I suppose," he continued, addressing the man he had called Bowles, "that it would have been more correct to chain you first and tell my story afterwards; but I knew you could not give me the slip. That man, boys, was Murphy's partner in a contract on this road and tried to get him to swindle the company. Matt wouldn't do it and threatened to show him up,—and now that he's dead this fellow takes his revenge out in attacking his character. However, he's so badly wanted at headquarters just now that he will keep his mouth shut about Murphy for the next ten years."

THE HUNDREDTH MAN.*

BY FRANK R. STOCKTON,

Author of "Rudder Grange," "The Lady, or the Tiger?" "The Late Mrs. Null,"
"The Casting Away of Mrs. Lecks and Mrs. Aleshine," etc.

XXXIV.

WHEN our poor Gay had been sufficiently aroused from her lethargy of soul and body to make one feeble stroke in battle against Death, the action and its result appeared to interest her, and she made other strokes with encouraging effect. Day by day her arm grew stronger, her attitude more determined, until the enemy, from falling back little by little, retreated altogether, accompanied by the insidious ally who had incited him to the conquest of Gay's young life.

To all Gay's friends this was a season of great rejoicing, and to Mrs. Justin it was a resurrection. She had watched the gradual death of the bright, strong young friend she had known so well, and had seen her utterly pass away, leaving in her stead a helpless, listless, careless being whose living was not life and of whom there was but little left to die. But now Gay was once more the true Gay, not yet quite her old self, but hour by hour approaching nearer to that most lovable creation.

As she grew stronger her friends came to her; and among them, Stratford. This friend, from the moment he had heard of the change in Gay, had braced himself for action should she return to that life which had been supposed lost to her. In that event there must be no doubt, no indecision, no hesitation; his part must be chosen and must be enacted steadfastly and honestly unto the end.

There was no hesitation, no doubt, no indecision. He came to her as the friend of old, the adviser, the helper, the master. These, and no more, he intended ever to be. Without a question or a thought, Gay seated herself at his feet. To her the action was again as natural as when she had sat there before.

Arthur Thorne came also to Gay; came earlier than Stratford. He had told Mrs. Justin of that memorable interview with the almost dying girl, and he concealed nothing of what he had done, or felt, or said. Mrs. Justin smiled

sadly. Her heart was pained, but she could not reproach him. If it should be that he had given Gay back to her, he deserved gratitude which could not be measured. She was ready to yield him this, but she gave him no more. His hopes were not her hopes.

When Gay was strong enough to come into the library and sit in the easy-cushioned chair before the tall wide window, Arthur, as has been said, was among her earliest visitors. Nothing could have induced him to deny himself this privilege, and yet it was a hard thing for this young man to present himself before this young girl. He had said all that lover could say, but as a lover he must now say nothing. What may burst forth from a full soul to one whose life is ending must be repressed when that life is slowly and feebly beginning again. He must meet her as though that other meeting had not been, and without knowing what effect his words had had upon her.

Arthur had plunged into love's Rubicon, but he had not crossed it. Chilling and dangerous as might be its waters, he would make no stroke forward until the time had come for him to seek his fate upon the other shore.

While Gay had been constantly in the mind of Arthur, so into Gay's mind, as she quietly lay on her lounge and in her chair during the happy hours when in a slow and steady tide her health and strength flowed back upon her, came thoughts of Mr. Thorne. On that day when his voice had roused her from her dream of girlhood and from her half-unconscious gazing into the bright world of empty air beyond her window, she had not wondered when she turned and saw him at her side. The faculty of wonder had gone to sleep or had died. All things to her were commonplace and ordinary. But it was not long before the recollection of that kneeling figure by her side caused wonder to revive. At first she asked herself why he had come to her? why it had been he who had incited her to turn on Death and resist him? But this question she did not ask long; it answered itself. She remembered well his words, and having looked on his pale and earnest countenance, it was impossible to

forget it, or to misconstrue its meaning. Then she asked herself, Why did he feel this way? Thus questioning, musing, pondering, she went back over her intercourse with Arthur Thorne, called to mind this and that thing he had done or said, suited motives to his actions, or resolved his actions back to motives, and so Arthur came often and dwelt long in her thoughts without meeting with any hustling or incommoding company.

The matter was now plain enough to her on his side, but not at all plain on hers. Often and often she tried to make it plain to herself on her side, but she could not do it. She came to the conclusion that this was something too hard for her just now, and she gave up the attempt. One definite thing she did for Mr. Thorne,— she gave him a new position in her mind. Up to this time she had always looked upon him as a Number Two. He was gentle; he was considerate; he was kindness itself; he was talented; he had learned many things and he knew how to think for himself; he was handsome, with the bearing of a gentleman; and in his soul she had found many sympathies; but, notwithstanding all this, she had looked upon him as Number Two. But now there was a change. Speaking as he had spoken, and feeling as he had felt, no matter why or to what end, there was no one to whom Arthur Thorne could stand second.

When the time came that she could see visitors the heart of Gay was troubled. Of course he would come to see her, and what would he do? His presence might be embarrassing, but then, on the other hand, it would be so very strange if he did not come. What would he say to her? Would he look as he did when she last saw him? As for herself—what she should say, or think, or do, she knew not. The whole affair was very puzzling, and it depended so much upon circumstances.

When Gay's friends began to come to her, Mrs. Justin never left her alone with visitors. Enthusiasms and draughts needed her watchful eye. She too was anxious about Mr. Thorne, but when he came he brought with him no cold accompaniment of outer air, left behind him no open doors nor undrawn portière, and his manner was under the same quiet restraint that it was wont to be. But his face was very pale, and any stranger could have seen that his interest in Gay's condition was deep and true. Gay herself was a little pale at first, but this soon passed away. When he had gone, she fell into a state of wonder. Could it be true that all that had happened which she remembered? Or was it one of the queer dreams which had come to her at that time? But after he had made her two or three visits, Gay

began to imagine that what she saw in him was an outer crust of kind restraint and tender regard for her new strength, and that there was something under this crust which sometimes shook it, although so slightly that perhaps no one knew it but herself. The presence of Mrs. Justin was a bar to words or emotion, but Gay wondered that there was not the least little bit of a sign that he remembered what he had said; if, indeed, he had ever said it. If he ever should speak, would he show that he had repented having been carried away by his sorrow that she was going to die? or would he think it well not to speak again? or would he repeat what he had said?

Gay was quite right when she thought she saw beneath Arthur's quiet restraint some signs of internal commotion. In fact he was torn, he was almost riven; he slept not by night, nor took aught of comfort in his life. He, too, questioned himself, but he only asked: "What does she think of me? What does she expect of me?"

One day, when Arthur was with the two ladies in the library, Mrs. Justin was called away to receive a visitor. Gay offered no opportunity to the embarrassment of silence, and began instantly to speak.

"Do you know, Mr. Thorne," she said, "that I have a very funny idea about you? I believe that you have forgotten my name, and that you are ashamed to ask anybody what it is. You don't address me by any name whatever, and I sometimes fancy that while you are sitting here you are going over the alphabet in your mind, hoping that in that way the name will come to you, and I suppose that in such cases people generally slip too quickly over A, because it is the first letter, and they are in such a hurry to get on to the others."

Arthur drew closer to her. "Once," he said, speaking very quickly, and in a low tone, "I called you by a name which perhaps I had no right to use, but, until I know that, I can never call you by any other. Do you remember?"

A tender glow came into Gay's cheeks and temples as though the fair Hygeia had suddenly touched her with a wand and sent into her veins the rich young blood which once coursed through them. There was a faint sparkle in her eyes, but this was hidden by the long lashes which now shaded them.

"You spoke very kindly to me that day," she said. "You were so good to me—"

"Oh, don't speak of kindness," interrupted Arthur. "I beg you not to think of that now. Don't you remember that I called you Gay? that I said I loved you? Don't you remember that?"

"I remember," said Gay, speaking very softly, with her eyes still more shaded, "but I have thought — have fancied — that it might have been one of those dreams I used to have."

"It was not a dream," said Arthur, a trembling earnestness in his voice. "It was all real. Oh, Gay, dear Gay, I called you that. I said I loved you. May I call you so again? May I say so once more?"

"Mr. Thorne," said Gay, still speaking very softly, "I think that this is all too soon. You could not have had those feelings very long; and as for me, — not knowing but it might be a fancy or a dream, — what you now say seems to come so unexpectedly. Do you not think you ought to wait?"

"Wait!" exclaimed Arthur. "How long?"

"I don't know," said Gay — "some time."

"And may I love you while I wait?" asked Arthur.

The glow on her cheeks and temples increased somewhat, as if Hygeia had forgotten to remove her wand, and it spread to the little ears which lay among the soft light brown, almost golden, hair which once had covered Arthur's hand, and even spread itself upon his wrist. The light in her eyes, now but slightly shaded, seemed to flash something of itself into her lips, which tremulously moved, as though they held between them a word with which they might play but not let go. But the word was too strong for them, and as for a moment Gay's large eyes were turned upon Arthur's glowing face, it made a quick escape.

"Yes," said Gay.

Wait! Who on earth could have waited?

Arthur did not; in a moment he had her in his arms. And, when she was there, it came to her in a flash of consciousness that all the thinking she had been lately doing, all the wondering, all the questioning of herself, had been but the natural, simple, and certain pathway to those arms.

xxxv.

WHEN Enoch Bullripple reached the western town in which lived those persons who were said to have inherited legal rights in the Cherry Bridge farms, he found but one of them. This was a Mr. Hector Twombly, a man of about forty years of age, a very stout and even plump figure, a round face totally devoid of beard, red cheeks and lips, and with as much of an outward air of boyishness as is compatible with forty years of actual age. By profession he was a stock-raiser, a general merchant, a grist and saw mill owner, and one of the proprietors of an important stage and mail route.

Mr. Twombly listened with great attention to Enoch's account of the business which had brought him there, and then he invited the old farmer to take supper with him, and to stay all night, and, in fact, to make his house his home as long as he should be in that part of the country. The next morning in the very plainly furnished counting-room of his store, in which the greater part of his extensive and varied business was conducted, he communicated to his visitor his decision regarding the Cherry Bridge property.

"Now, then, Mr. Bullripple," said Mr. Twombly, sitting up very straight in his chair, with one plump, well-shaped hand upon each of his outspread knees, "this is about the size of this business as it appears to me. My uncle, Thomas Brackett, who I never saw and have heard very little about, — my mother having married young and come out here pretty much among the first settlers, — owned the farm you live on and that other one, and when he died they went, naturally enough as everybody thought, to his nephew Peter, who was living with him, and who everybody looked upon as the same thing as his son and heir. That is the way in which I have heard the matter stated."

"You've put it just right," said Enoch.

"Now, then, when Mr. Peter Brackett walked into that property there wasn't nobody there to ask any questions, and it isn't likely that Mr. Peter Brackett bothered his head about any sister of his uncle who went out West ever so long ago, and might be dead by that time, for aught he knew. Perhaps he never heard of her."

"You bet he did!" said Enoch, "but that's neither here nor there."

"No," said Mr. Twombly, "that's neither here nor there. Well, then, after a while Mr. Peter got tired of farming and concluded to sell out, and he did sell out to you and to that other gentleman, and you two paid for the property, cash down, clean and finished, bargain and sale. You showed me your papers, and I suppose the other gentleman could show his, if he was here."

"Yes," said Enoch, "but that farm was first bought by my brother-in-law, and he had to give a mortgage on the land. This was took up and paid by Mr. Stull, who now owns the farm."

"All right," said Mr. Twombly. "You and Mr. Stull now own the two farms, having bought and paid for them; and then, somehow or other, you hear that old Tom Brackett had other nephews besides the aforementioned Peter, and that I am one of them and my brother Ajax the other, and you come out here and put the whole case before me. Now,

it ain't for me to ask whether you did this because you was so touchy honest that you couldn't sleep in your bed till you knew everybody had his rights, or because you thought somebody else might come out here and make a bargain with us and so get the inside track of you. That's what I haven't got the right to bother myself about."

"No," said Enoch, "you han't."

"But this much I have got a right to do, and that is to say that when you bought that farm you bought it, and when you paid for it it was yours. Now, if I and my brother Ajax have any rights in this business, and there isn't any doubt but what we have, our rights are in the money that Peter Brackett got for those farms, and not in the farms themselves, which you two men have fairly bought and paid for."

"That's not the way the law looks at it," said Enoch. "Peter Brackett sold what wasn't all his."

"That's the way I look at it," said Mr. Twombly. "Durn the law! And my brother Ajax will look at it just as I do, because if he don't I'll break his back, and he knows it. Now, sir, we've got nothing to do with those two farms that have been fairly bought and sold. What we've got to do with is the money Peter Brackett got for them. You've told me where he is settled, and when we're ready we'll come down on him. That's our business. And all we've got to do with you is to have the papers made out, giving you a clear title to your farm, as far as I and Ajax are concerned. My lawyer here will attend to that, and there is a cowboy in town who is going to start out early to-morrow morning to the ranch where Ajax is just now, and he'll sign them and send them back day after to-morrow. And if that Mr. Stull wants his business fixed up in the same way, all he's got to do is to send his documents out here and let me see for myself that everything is all straight, and we'll give him the same sort of title as we give you."

Thereupon Mr. Twombly and Mr. Bullripple shook hands on the bargain. And while waiting for the arrival of the return cowboy with the signature of Ajax, Enoch's host drove him about the surrounding country in a handsome buggy with two fast trotters, showed him over his two mills and his store, his stock yards and his stage stables, and gave him to eat and drink of the best and the most abundant.

When Mr. Bullripple returned to Cherry Bridge, he felt that he now truly owned his farm, but that he had lost his opportunity of triumphing over Mr. Stull and Zenas Turby. It was true that he had prevented those two plotters from triumphing over him. Enoch

had expected more than this, but this was really so much he felt that he ought to be satisfied. He had, indeed, come off wonderfully well.

But there was a minor triumph left open to him, and the crafty old farmer was not slow to avail himself of it. He would assume the position of the benefactor of Mr. Stull. He would say to him: "You need trouble yourself no more about this affair; I have been out West myself and have arranged everything with the heirs of your property. I will tell you exactly what you have to do in order to make your title quite secure. I am very glad to be able to put you once more on a sound footing in our part of the country; and this, too, without any trouble or expense on the part of yourself or your agents."

Enoch knew that this would be very hard on J. Weatherby Stull, whose soul would naturally scorn the idea that it was possible for any one to bestow a benefit upon him, especially one whom he hated on account of injuries conferred. He knew too that by this course of action he would deal a heavy, although an indirect, blow at his old enemy, Zenas Turby. Enoch had put this and that together to such purpose that he had become convinced that Turby was Stull's agent in this matter of the Cherry Bridge farms; and that, when the principal should be made aware that the whole business had been settled without the knowledge of his agent, the latter would, as Enoch put it to himself, "ketch fits."

To a certain extent Enoch's plan was quite successful. When Mr. Stull was informed of what had been done he was angry, and would have been mortified had he not attributed the failure of his scheme to the stupidity of Turby, who was summoned to New York, and who did, in very truth, catch fits.

Had this failure of a well-planned project occurred a month or two earlier, Mr. Stull would have been much more affected by it than he now was. Other plans and purposes had failed at about the same time, and the strong mind of Mr. Stull was rising above the storms which beset him, in order that he might see how he could take advantage of them. It was his custom to turn, if possible, bad fortune, as well as good, to his advantage. When he discovered that his ownership of Vatoldi's was becoming dangerous, not only on account of John People's intended marriage but because of his daughter Matilda's possession of his secret, and her opposition to a Vatoldi connection, and when he found out that Matilda would certainly marry Mr. Crisman, with or without paternal consent, he was at first extremely indignant, and afterwards sternly resolved.

He brought his mind to the determination that Vatoldi's had had its day, and must be put behind him, but he would put it behind him in his own and in an advantageous way. He came to the same decision concerning his daughter's marriage. Crisman, he found, was a man of good character and fair connections and of more than the average business ability. If his hard-headed and inflexible daughter would marry this man she might do so, and he would place the couple in a position which would be creditable to himself and his family, and in which Crisman might rise if he should prove equal to mercantile soaring. Then Mr. Stull would put Matilda and her husband behind him. Another object grander than a restaurant or a daughter's marriage loomed up before him, and to this he would devote his life.

When John People was informed by Mr. Stull that the latter had decided that John should buy out Vatoldi's, the young man was frightened. It was too much! It was beyond his belief in his powers! He would much prefer that Mr. Stull should sell out to some one else, and that he should continue as junior partner and manager. But Mr. Stull told him that it was impossible to sell to any one else. The transaction could take place between John and himself, and no others. The terms decided upon by Mr. Stull were not easy ones. John was to raise a certain sum in cash, and pay it down; he was then to make payments at fixed and frequent intervals both as interest and as installments on the remainder of the high price put upon the establishment, which would make it necessary for him to do a very lucrative business, and for a long time to hand over to Mr. Stull a very large proportion of his profits.

When Miss Burns heard of Mr. Stull's purpose in this matter she was not frightened. It would be a hard and long fight, she knew, but she advised John to go into it. In fact, she decided that he should go into it. As soon as the transfer of the business should be completed they would marry, and then she would give up her position in the store, and enter, heart, soul, and body, into her husband's business. She would sit behind the desk and be the cashier, thus saving money to John and giving him the opportunity to be in all the other places in which he ought to be, and to do all the other things which he ought to do.

John People is now owner of Vatoldi's. He has not paid for it, and it will be years before he does so, but, so far, he has fulfilled all his obligations. His brow has been a good deal furrowed by the necessity of hard work and careful calculation in order to do this, but all signs of resignation have disappeared from it, and have been succeeded by a general air of

cheery earnestness. His wife is much plumper than when she was Miss Burns; sweet-breads, lamb-chops, and all the delicacies of the restaurant are her own whenever she wants them, without a preliminary reservation in the corner of an ice-box. Mrs. People makes her son long visits, especially in the winter when there is little to do at the farm, and although she thinks John the most fortunate as well as the most deserving of men, she is convinced that no better fortune ever befell him than when he escaped the clutches of that Stull girl.

There is one great change in the Vatoldi establishment: Mr. Stull is never seen there. He has put it behind him. The restaurant, however, is as well managed and as popular as it ever was.

"I shall make it a rule," said John People to his wife, "to manage that place exactly as if I expected, at from fifteen to twenty minutes past one, to see Mr. Stull walk in at the door and clap his eyes on everything on the premises, from a spot on a table-cloth to an overdone steak."

Thus over the fortunes of Vatoldi's hovers the invisible but protecting influence of J. Weatherby Stull.

The good fortune of John People not only bore heavily upon that young man, but upon his Uncle Enoch. Mr. Bullripple entirely approved of the purchase of Vatoldi's, although he fully appreciated the weight of the load that it would lay not only on his nephew's shoulders, but his own. John had not been able to save much money, and in order to make the first cash payment it was necessary that he should be generously helped. To this end Enoch collected every cent that he could possibly gather together, and put himself under obligations to Mr. Stratford for the remainder of the money needed. The old farmer had no fear but that in the course of years John would be able to pay back everything, and would eventually die a rich man. If his nephew had desired assistance in order to enter into agricultural pursuits Mr. Bullripple would not have lifted a finger to aid him. But he had great faith in the right kind of a restaurant.

Miss Matilda had most truly succeeded in her various plans, but while she was entirely satisfied, she was not elated. She had expected to succeed. She thoroughly understood her father's character, and although she knew that it would be utterly impossible to dam or stop the powerful current in which his nature flowed, it was quite possible, were the impediment wide enough, high enough, and solid enough, to turn the stream in a new direction. She could be such an impediment, and having thrown herself across his current, suggesting

at the same time a change of channel, she was not at all surprised to see the change made.

In the course of the winter Mr. Crisman and Miss Stull were married in a manner entirely suited to the social position of the bride. To these proceedings Mr. Stull gave a lofty and dignified assent. The element of interest in his approbation appeared to be but moderate, and, entirely contrary to his previous record, he interfered very little with the details of this important family occasion. It is probable, however, that no feeling, whether of apathy or disapprobation, could have prevented him from taking his usual place as director of affairs had he not known that that position had been assumed by his daughter Matilda.

With capital furnished by his father-in-law, Mr. Crisman entered, as a junior partner, the great mercantile firm of which he had been an employee, and he looked upon himself as in every way a most fortunate and successful man. In his marriage relation he was indeed quite fortunate. From the very beginning his wife set herself to work to manage him, and in order that she might do so without trouble to herself or dissatisfaction to him, she also set herself to work to make him happy. Having, by diligent study, made herself thoroughly acquainted with his character, she succeeded admirably in both these regards.

When Mr. Crisman thought of that love affair which antedated his engagement to Miss Stull,—and during said engagement such a thought did sometimes come to him,—he found that the place in his sentiments which once had been filled by this love was now occupied by a modified form of anger, which was principally aimed at a want of respect for his opinions, his position, and himself which had been exhibited by all the persons with whom that affair had connected him. But these thoughts came less and less frequently—like Mr. Stull, Crisman was a man who could put things behind him.

When the powerful current of Mr. Stull's action and interest had been turned from its course by his daughter Matilda, aided by the force of events, she had no idea of the new channel in which it would flow. No one, indeed, except her father, could have had such an idea, and even he, when he came to survey and fully comprehend the nature and extent of this fresh channel, was surprised at what he deemed its importance and its grandeur.

Mr. Stull was a man whose pleasure in life was to be found in lofty flight. Whether he soared as a restaurant keeper, a social and church pillar, or as a financial operator, he wished to fly high and look down on his fellows; and his strength of wing was powerful and enduring. There were some flights he

could not take, and these he did not essay. He would have liked to look down upon railroad kings, but he dwelt upon no Andes, nor were his wings of condor size.

He had long had in mind a scheme which pleased him much; and for some years he had thought that a great part of the fortune which he intended to leave behind him should be devoted to carrying out this scheme. But now his purpose was changed. His speculations and investments had been exceptionally successful, and he was a very rich man much sooner than he had expected to be. It was quite possible for himself to do, in these vigorous years of his natural life, what he had expected to order that others should do after his death. When this decision had been reached, it greatly gratified the soul of Mr. Stull. This new object of his life was far higher, far nobler, than anything he had yet touched. It would give him loftiness, it would give him power.

Mr. Stull determined to found, create, and direct a Law Hospital. He had never studied law, nor did he pretend to understand its principles or practice; but, in the course of his varied business life, he had become acquainted with many phases of its effect upon society as well as many phases of its relations to the ordinary and to the extraordinary man. Pondering upon this subject, he had come to the conclusion that, in its general relation to mankind, law was to be looked upon in the same light as medicine and surgery. If the latter demanded hospitals for their perfect and complete practice, so did the former. As the means of amelioration or removal of those evils against which the powers of medicine and surgery are directed are open to all, so Mr. Stull thought the amelioration or removal of those evils against which the power of the law is directed should be equally open to all. Therefore he determined to found a Law Hospital, where those persons who were unable to pay for legal protection should receive it as freely as the ailing poor receive medicine and treatment in hospitals of the other kind.

When Mr. Stull undertook an important enterprise, he brought his strong and practical intellect to bear upon its probable disadvantages as well as its advantages, and before he spoke of this great scheme, he made himself quite ready to meet any objections that might be urged against it. When persons came to him and said that such an institution would have a very bad effect upon the poor, for it would encourage them to be quarrelsome and go to law, Mr. Stull rose easily above the objectors and replied: "There is no more reason to suppose that than to suppose that the ordinary hospital encourages sickness or broken legs among the poor. It will be almost

impossible for a sham or unworthy case to get into my institution. There will be a Board of Examiners composed of high legal talent who will investigate every application, and if there are not good grounds for taking it into the courts it will be rejected, but if, on the other hand, it shall be found to be based on good grounds, it will be carried through to the very end, to the very end, sir; if it should be the case of a brakeman against a millionaire, it will be carried through; you may be sure of that. And then, again, sir, it will prevent a great deal of litigation. There are lawyers, sir, who take up unjust cases for clients who are unable to pay in hopes of sharing in unjust advantages. My institution will greatly assist in putting an end to such practices. The fact that it never takes up an unjust case will shine as an example, sir, and those who are unjustly proceeded against will find in my Law Hospital a strong ally in defense."

Mr. Stull was a vigorous upholder of strict justice. He was not generous, he was not forbearing, he had not a kindly spirit. His present enterprise was intended as much to defeat and humble the unjust rich as to assist the oppressed poor. If he could have legally revenged himself upon Enoch Bullripple he would have done so gladly; and had he seen another person oppressing the old farmer in a perfectly legal way he would have had no disposition to interfere. Furthermore, what he did for the advantage of mankind must carry out some of his own practical ideas, and must be of advantage to himself. These conditions he fully expected the Law Hospital to fulfill.

In the first place, it would give him power and position. By its aid he might be enabled to take an occasional flight above the head of even a railroad king. There was no station which would please and suit him so well as that of the Founder and Director-in-Chief of the great institution he intended to establish. Then, again, he expected his Law Hospital to become a source of profit. It would be an admirable school of practice for young lawyers who would pay fees for this advantage, and who would not only be supervised by the body of high legal talent who would direct the operations of the institution, but would receive from said body much valuable assistance and instruction. The vast resources of the Hospital would be open, not only to the poor, but to those who would be able to pay, and its strictly regulated charges and prompt and vigorous methods would prove a great inducement to persons who would hesitate to place themselves in the power of unrestricted and irresponsible legal advisers.

The scope of this institution was a very wide one. It would be a great Law School; the

decisions of its Board of Examiners would meet with such high regard that, in time, it would come to be looked upon almost in the light of a court of law; it offered to the poor the legal redress of wrongs; and to all men it would afford the opportunity of obtaining the assistance of the law of the land in a systematic, economic, and perfectly practical and business-like manner.

And it would enable this generation, and in all probability many generations hereafter, to read on a marble slab in the great entrance hall the name of its Founder and first Director-in-Chief, J. Weatherby Stull.

XXXVI.

As THE winter months went on, the goddess Hygeia did so truly touch with her wand the fair Gabriella Armatt that this young person bloomed out in full health and vigor; and when the jonquils in the little yard in front of Mrs. Justin's town house forced their tender blossoms into the uncertain air of spring, they were greeted with no happier eyes than those of Gay.

Our heroine was not one who had put things behind her. In her life it had seemed as if certain things had pushed her before them, and, remaining stationary themselves, had gradually faded from sight as she went on. That first young love, which had grown to be a true, conscientious, but anxious affection, had not gone on with her. She had now begun a new life, and it was a life without that old affection.

If, in those melancholy days in the past year when she seemed to be left alone in the world, her soul had, half-unconsciously, looked toward Horace Stratford with vague feelings other than those of friend to friend or scholar to master, those feelings existed no more. Her new life had begun without them. When Stratford looked upon her now he saw not that certain something, that sympathetic stamen which at times springs suddenly from a woman's heart, and which had made her perfect in his eyes; she was his friend, loyal and warm; she was his disciple, earnest and trusting; but on her face that certain something never appeared—for him.

The effect upon Arthur Thorne of his love for Gay was somewhat surprising, even to himself. He had thought it would change him, make a different man of him, but in fact it produced in him but little change that was radical. His tastes, his strict regard for the proper, and his conscientious views of duty to himself and society, still remained upon the solid foundations on which they had always stood, but into his nature had come a warm-

hued liberality of feeling which was born of his admiration for Gay's nature.

Gay's nature was a strong one and fully animated, and it would have had its influence upon any man, but it could not put into a man's nature what was not there. With Crisman she would have failed utterly, but in the warm radiance of her influence the colors came out in the nature of Arthur Thorne as the bright spots and brilliant hues appear upon the wings of a moth as he draws their slender folds from his cocoon into the bright light of day.

As to Gay's aspirations and the life-work to which she had looked forward, these two young people, from having widely different opinions, came to think alike. When Gay started on her course of advanced study, she had not definitely fixed her mind upon the special path in life to which this study was to lead her, but she had determined that she would do something which should satisfy her ambition and be of service to other people. She had no notion that one whit of her work in college and afterwards should be wasted. She was to be something which should be worthy of herself, of her instructors, and of those heights of knowledge to which she hoped to climb. Even when she became engaged to Crisman her ideas did not change, although by the counsel of Mrs. Justin, and, subsequently, by the influence rather than by the direct advice of Stratford, she modified them. She would put her intellect in perfect training before she decided on what field she would send it forth to do battle. Even the academic degree to which she directed her course was looked upon more as a guiding point than an object: she might never claim it, but if she made herself worthy of it her intellect would be well trained.

When Gay's purpose of study was made known to Arthur Thorne during the days he spent at Cherry Bridge, he was very much opposed to it and talked a great deal to Mrs. Justin about it. He believed that when any one entered upon a course of earnest endeavor, it should have a fixed and definite object. If the young lady intended to devote herself to any branch of philosophy, science, or literature, she should concentrate her energies upon those studies which would prepare her for her future work. When he became engaged to Gay this idea of the limitation and concentration of her energies, even at her present stage of progress, was still in his mind. But when the two had talked over the matter they came to think alike. Arthur still believed that earnest study should have its object, but he soon understood that Gay had an object, and his soul expanded itself to appreciate its beauty

and value. He agreed with her that the conviction that one's intellect has been well cultivated is a sufficient reward for the labor of the cultivation.

They would work together,—there could be no doubt about that,—and if the time came when they felt they were able to do something for the world which in a degree would repay the world for what it had done for them, then they would do the thing which they believed they best could do. If their young ambitions led them truly, they would not only penetrate to the head-waters of thought and knowledge, but they would lend their services towards clearing out their channels and digging down into their sources. But if ambition led them not so far, they would stop when they could feel content that they had fulfilled the duty they owed their intellects, and had done their best to qualify themselves to think and act and live.

There is no danger that they will flag in this projected career. They are strong, earnest, and enthusiastic; and in Stratford they will always have a wise and steadfast friend and backer. Their life-work and their life-love will go on together, and the one will not be interfered with by the other.

Gay and Arthur were married in the time of early roses; and then they went away and wandered joyously; coming back when the peaches were ripe and the juice of the grape-clusters was beginning to turn red and purple. Then it was that Mrs. Justin invited the young couple to her house at Cherry Bridge, to which Stratford still came over from the Bullripple farm on most of the days of the week. These holidays of Gay and Arthur could not last much longer, for in the early autumn they must go into the city and begin the life they had marked out for themselves, which, for Arthur, would not be a very easy one, for it was necessary that his professional labors should keep pace with every other kind of work or study.

They made good use, therefore, of this pleasure-time, and Gay, knowing the country better than her husband, generally acted as guide and suggestor. She took him, at the close of a day, through the sugar-maple grove to the little eminence where they could sit on the top rail of the fence and see the sunset glories of the western sky. They rowed upon the creek, and it was astonishing what a memory Gay possessed for sunken trees, shallow places, and sharp turnings. She guided Arthur into the tributary stream overshadowed by the forest, trees, and they stopped at the spot in the heart of the woods where all seemed quiet and motionless save the dragon-flies and the flecks of sunlight on the surface of the pool and where a spreading and low-hanging grape-vine formed a water-arbor under which a little boat might

lie. Now the air bore not the perfume of the tender blossoms of the vine, but the wild grapes hung dark, though not yet ripe, from under their broad leaves, and Gay could put up her hand and touch them.

One morning the two were sitting together on a rustic bench on the lawn. Gay held a book in her lap, on the blank leaf of which she was making a sketch, not from nature, but from her imagination. Arthur, one arm on the back of the seat, watched with ardent interest the rapid growth of the drawing. They were in the shade, but all the air was full of light. Gay was very lovely that day. She wore a morning gown of pale blue, the front generously draped with white soft-hanging lace which ran away in graceful lines into the folds which lay about her feet. The wide brim of her hat was lined beneath with light blue silk, which threw a subduing influence upon the golden tints which always seemed ready to break out in the masses of hair beneath it, and extended its shade over the fair face, now slightly bent towards the drawing. Upon the crown and broad straw brim of this hat were clusters of apple-blossoms, which lay as naturally as if it had been spring-time and they had just dropped there from some tree.

Mrs. Justin and Stratford were standing upon the piazza looking at the young people on the lawn. It was a charming picture and well worthy their contemplation.

"Now, sir," said the lady, "there we see the full fruition of your work. Are you satisfied with it?"

"I am," he answered. "It was good work. And are you yet fully content?"

"Yes," said Mrs. Justin, "I believe I am. You know it was hard for me to be content, but I am beginning to see that events, as you controlled them, have resulted in great good."

Stratford made no answer. If he had spoken from the depths of his heart he must have said that great good indeed had resulted from what he had done; great good to Gay, great good to Arthur, and even good to that first lover, Crisman; good to every one, except himself. For in the fight he had fought he had been hurt—he had conquered, but he had been hurt.

The essence of Mrs. Justin's nature was loyalty, loyalty to past affection, loyalty to present friendships, and it was the ardent earnestness of this sentiment which threw into her friendship a sensitive and perceptive sympathy. Stratford said nothing; but she saw in his face something of what he thought.

"My friend," said she, laying her hand upon his arm, "could you have loved that girl?"

"Yes," said Stratford, "I could have loved her."

Mrs. Justin looked at him intently for a moment, and then she said: "Horace Stratford, I believe that you, yourself, are the hundredth man you have been looking for."

An expression of surprise came into the face of Stratford, and then he smiled, but the smile did not last long. "If you think so," he said, "I accept your decision, and my search is ended."

THE END.

Frank R. Stockton.

HIS ARGUMENT.

AD HOMINEM.

"**B**UT if a fellow in the castle there
Keeps doing nothing for a thousand years,
And then has — Everything! (That isn't fair
But it's — what has to be. The milk-boy hears
The talk they have about it everywhere.)

"Then, if the man there in the hut, you know,
With water you could swim in on the floor,
(And it's the ground. The place is pretty, though,
With gold flowers on the roof and half a door!)
Works — and can get no work and nothing more.

"What I will do is — nothing! Don't you see?
Then I'll have everything, my whole life through.
But if I work, why I might always be
Living in huts with gold flowers on them too —
And half a door. And that won't do for me."

VI.

SUMMONS was sent for Uncle Prince, and the old man soon made his appearance. He stood in a seriously expectant attitude.

"Prince," said General Garwood, "these ladies are from the North. They have

asked me about the dead Union soldier you brought home during the war. I want you to tell the whole story."

"Tell 'bout de what, Marse Peyton?" Both astonishment and distress were depicted on the old negro's face as he asked the question. He seemed to be sure that he had not heard aright.

"About the Union soldier you brought home with your young master from Virginia."

"Whar Miss Hallie, Marse Peyton? Dat her in dar wid de peanner?"

"Yes, she's in there."

"I 'lowed she uz some'r's, kaze I know 'tain't gwine never do fer ter git dat chile riled up 'bout dem ole times; en it'll be a mighty wonder ef she don't ketch col' in dar whar she is."

"No," said General Garwood; "the room is warm. There has been a fire in there all day."

"Yasser. I know I builted one in dar dis mo'nin', but I take notice dat de draffs dese times look like dey come bofe ways."

The old man stood near the tall mantel, facing the group. There was nothing servile in his attitude; on the contrary, his manner, when addressing the gentleman who had once been his master, suggested easy, not to say affectionate, familiarity. The firelight, shining on his face, revealed a countenance at once rugged and friendly. It was a face in which humor had many a tough struggle with dignity. In looks and tone, in word and gesture, there was unmistakable evidence of that peculiar form of urbanity that cannot be dissociated from gentility. These things were more apparent, perhaps, to Helen and her aunt than to those who, from long association, had become accustomed to Uncle Prince's peculiarities.

"Dem times ain't never got clean out'n my

min'," said the old negro, "but it bin so long sence I runn'd over um, dat I dunner wharabouts ter begin skacely."

"You can tell it all in your own way," said General Garwood.

"Yasser, dat's so, but I fear'd it's a mighty po' way. Bless yo' soul, honey," Uncle Prince went on, "dey was rough times, en it look like ter me dat ef dey wuz ter come 'roun' ag'in hit 'u'd take a mighty rank runner fer ter ketch onenigger man w'at I'm got some 'quaintance wid. Dey wuz rough times, but dey wa'n't rough 'long at fust. Shoo! no! dey wuz dat slick dat dey ease we-all right down 'mong's de wuss kind er tribbylation, en we ain't none un us know it twel we er done dar.

"I know dis," the old man continued, addressing himself exclusively to Miss Eustis and her aunt; "I knows dat we-all wuz a-gittin' 'long mighty well, w'en one day Marse Peyton dar, he tuck 'n' jinded wid de army; en den 'twa'n't long 'fo' word come dat my young marster w'at gwine ter college in Ferginny, done gone en jinded wid um. I ax myse'f, I say, w'at de name er goodness does dey want wid boy like dat? Hit's de Lord's trufe, ma'am, dat ar chile wa'n't mo' dan gwine on sixteen ef he wuz dat, en I up 'n' ax myse'f, I did, w'at does de war want wid baby like dat? Min' you, ma'am, I ain't fin' out den w'at war wuz — I ain't know w'at a great big maw she got."

"My son Ethel," said Mrs. Garwood, the soft tone of her voice chiming with the notes of the piano, "was attending the University of Virginia at Charlottesville. He was just sixteen."

"Yassum," said Uncle Prince, rubbing his hands together gently, and gazing into the glowing embers, as if searching there for some clew that would aid him in recalling the past. "Yassum, my young marster wuz des gone by sixteen year, kaze 'twa'n't so mighty long 'fo' dat, dat we-all sont 'im a great big box er fix-in's en doin's fer ter git dar on he's birfday; en I sot up mighty nigh twel day tryin' ter make some 'lasses candy fer ter put in dar wid de yuther doin's."

Here Uncle Prince smiled broadly at the fire.

"Ef dey wuz sumpin' w'at dat chile like, hit wuz 'lasses candy; en I say ter my ole 'oman, I did, 'Mandy Jane, I'll make de candy,

en den w'en she good en done I'll up en hol-ler fer you, en den you kin pull it.' Yassum, I said dem ve'y words. So de ole 'oman, she lay down 'cross de baid, en I sot up dar en b'iled de 'lasses. De 'lasses 'u'd blubber en I'd nod, en I'd nod en de 'lasses 'u'd blubber, en fus news I know de 'lasses 'u'd done be scorched. Well, ma'am, I tuck 'n' burnt up mighty nigh fo' gallons er 'lasses on de account er my noddin', en bimeby w'en de ole 'oman wake up, she 'low dey wa'n't no excu-sion fer it; en sho nuff dey wa'n't, kaze w'at make I nod dat a-way?

"But dat candy wuz candy, mon, w'en she did come, en den de ole 'oman she tuck 'n' pull it twel it git 'mos' right white; en my young marster, he tuck 'n' writ back, he did, dat ef dey wuz anythin' in dat box w'at make 'im git puny wid de homesickness, hit uz dat ar 'lasses candy. Yassum, he cert'n'y did, kaze dey tuck 'n' read it right out'n de letter whar he writ it.

"'Twa'n't long atter dat 'fo' we-all got de word dat my young marster done jinded inter de war wid some yuther boys w'at been at de same school-'ouse wid 'im. Den, on top er dat, yer come news dat he gwine git married. Bless yo' soul, honey, dat sorter rilded me up, en I march inter de big-'ouse, I did, en I up 'n' tell mistis dat she better lemme go up dar en fetch dat chile home; en den mistis say she gwine sen' me on dar fer ter be wid 'im in de war en take keer un 'im. Disholp me up might'ly, kaze I wuz a mighty biggity nigger in dem days. De white folks done raise me up right 'long wid um, en way down in my min' I des laid off fer ter go up dar in Ferginny en take my young marster by he's collar en fetch 'im home, des like I done w'en he use ter git in de hin-'ouse en bodder 'long wid de chickens.

"Dat wuz way down in my min', des like I tell you, but bless yo' soul, chile, hit done drap out 'mos' 'fo' I git ter 'Gusty, in de Nunitied State er Georgy. Time I struck de railroad I kin see de troops a-troopin' en year de drums a-drummin'. De trains wuz des loaded down wid um. Let 'lone de pas-senger kyars, dey wuz in de freight-boxes yit, en dey wuz de sassiest white mens dat yever walk 'pon topside de groun'. Mon, dey wuz a caution. Dey had niggers wid um, en de niggers wuz sassy, en ef I hadn't a-frailed one un um out, I dunner w'at would er 'come un me.

"Hit cert'n'y wuz a mighty long ways fum dese parts. I come down yer fum Ferginny in a waggin w'en I wuz des 'bout big nuff fer ter hol' a plow straight in de' furrer, but 'tain't look like ter me dat 'twuz sech a fur ways. All day en all night long fer mighty nigh a

week I year dem kyar-wheels go clickity-clock, clickity-clock, en dem ingines go choo-choo-choo, choo-choo-choo, en it look like we ain't never gwine git dar. Yit, git dar we did, en 'tain't take me long fer ter fin' de place whar my young marster is. I laid off ter fetch 'im home; well, ma'am, w'en I look at 'im he skeer'd me. Yassum, you may b'lieve me er not b'lieve me, but he skeer'd me. Stiddier de boy w'at I wuz a-huntin' fer, dar he wuz, a great big grow'd-up man, en, bless yo' soul, he wuz a-trompin' 'roun' dar wid great big boots on, en, mon, dey had spurrers on um.

"Ef I hadn' er year 'im laugh, I nev'd a-know'd 'im in de roun' worl'. I say ter my-se'f, s'I, I'll des wait en see ef he know who I is. But shoo! my young marster know me time he lay eyes on me, en no sooner is he see me dan he fetched a whoop en rushed at me. He 'low: 'Hello, Daddy! whar de name er goodness you rise fum?' He allers call me Daddy sence he been a baby. De minute he say dat, it come over me 'bout how lonesome de folks wuz at home, en I des grabbed 'im, en 'low: 'Honey, you better come go back wid Daddy.'

"He sorter hug me back, he did, en den he laugh, but I tell you dey wa'n't no laugh in me, kaze I done see w'iles I gwine long w'at kinder 'sturbance de white folks wuz a-gittin' up, en I know'd dey wuz a-gwine ter be trouble pile 'pon trouble. Yit dar he wuz a-laughin' en a-projickin', en 'mongs' all dem yuther mens dey wa'n't none un um good-lookin' like my young marster. I don't keer w'at kinder cloze he put on, dey fit 'im, en I don't keer w'at crowd he git in, dey ain't none un um look like 'im. En 'tain't on'y me say dat; I done year lots er yuther folks say dem ve'y words.

"I ups en sez, s'I, 'Honey, you go 'long en git yo' things, en come go home 'long wid Daddy. Dey er waitin' fer you down dar'—des so! Den he look at me cute like he us'ter w'en he wuz a baby, en he 'low, he did:

"'I'm mighty glad you come, Daddy, en I hope you brung yo' good cloze, kaze you des come in time fer ter go in 'ten'ance on my weddin'.' Den I 'low:

"'You oughtn' be a-talkin' dat a-way, honey. W'at in de name er goodness is chil-luns like you got ter do wid marryin'?' Wid dat, he up 'n' laugh, but 'twa'n't no laughin' matter wid me. Yit 'twuz des like he tell me, en 'twa'n't many hours 'fo' we wuz gallopin' cross de country to'ds Marse Randolph Hern-don' place; en dar whar he married. En you may b'lieve me er not, ma'am, des ez you please, but dat couple wuz two er de purtiest chilluns you ever laid eyes on, en dar Miss Hallie in dar now fer ter show you I'm a-tellin' de

true word. 'Mos' 'fo' de weddin' wuz over, news come dat my young marster en de folks wid 'im mus' go back ter camps, en back we went.

"Well, ma'am, dar we wuz — a mighty far ways fum home, Miss Hallie a-cryin', en de war gwine on des same ez ef 'twuz right out dar in de yard. My young marster 'low dat I des cum in time, kaze he mighty nigh pe'sh'd fer sumpin' 'n'er good ter eat. I whirled in, I did, en I cook 'im some er de right kinder vittles: but all de time I cookin', I say ter myse'f, I did, dat I mought er come too soon, er I mought er come too late, but I be bless' ef I come des in time.

"Hit went on dis a-way scan'lous. We marched en we stopped, en we stopped en we marched, en 'twuz de Lord's blessin' dat we rid hosses, kaze ef my young marster had 'a' bin 'blige' ter tromp thoo de mud like some er dem white mens, I speck I'd 'a' had ter tote 'im, dough he uz mighty spry en tough. Sometimes dem ar bung-shells 'u'd drap right in 'mong's' whar we-all wuz, en dem wuz de times w'en I feel like I better go off some'r's en hide, not dat I wuz anyways skeery, kaze I wa'n't; but ef one er dem urbung-shells had er strucken me, I dunner who my young marster would 'a' got ter do he's cookin' en he's washin'.

"Hit went on dis a-way, twel, bimeby one night way in de night, my young marster come whar I wuz layin', en shuck me by de shoulder. I wuz des wide 'wake ez w'at he wuz, yit I ain't make no motion. He shuck me ag'in, en 'low: 'Daddy! O Daddy! I'm gwine on de skirmish line. I speck we gwine ter have some fun out dar.'

"I 'low, I did: 'Honey, you make 'aste back ter break'us, kaze I got some sossige meat en some gennywine coffee.'

"He ain't say nothin', but w'en he git little ways off, he tu'n 'roun' en come back, he did, en 'low: 'Good-night, Daddy.' I lay dar en I year un w'en dey start off. I year der hosses a-snortin', en der spurrers a-jinglin'. Ef dey yever wuz a restless creetur hit uz me dat night. I des lay dar wid my eyes right wide open, en dey staid open, kaze, atter w'ile, yer come daylight, en den I roused out. I did, en built me a fire, en 'twa'n't long 'fo' I had break'us a-fryin' en de coffee a-b'ilin', kaze I spected my young marster eve'y minute; en he uz one er dese yer kinder folks w'at want he's coffee hot en all de yuther vittles on de jump.

"I wait en I wait, en still he ain't come. Hit cert'n'y look like a mighty long time w'at he stay 'way; en bimeby I tuck myse'f off ter make some inquirements, kaze mighty nigh all he's comp'ny done gone wid 'im. I notice dat de white mens look at me mighty kuse w'en I ax um 'bout my young marster; en bimeby

one un um up en 'low, 'Ole man, whar yo' hat?' des dat a-way. I feel on my haid, en, bless goodness! my hat done gone; but I 'spon' back, I did, 'Tain't no time ter no nigger man fer ter be bodder'n' 'bout he's hat,' des so. Well, ma'am, bimeby I struck up wid some er my young marster' comp'ny, en dey up 'n' tell me dat dey had a racket out dar en de skirmish line, en dey hatter run in, en dey speck my young marster be 'long terreckerly. Den I year some un say dat dey speck de Yankees tuck some pris'ners out dar, en den I know dat ain't gwine do fer me. I des runn'd back ter whar we been campin', en I mount de hoss w'at my young marster gun me, en I rid right straight out ter whar dey been fightin'. My min' tol' me dey wuz sumpin' 'n'er wrong out dar, en, I let you know, ma'am; I rid mighty fas'; I sholy made dat ole hoss git up fum dar. De white mens dey holler at me w'en I pass, but eve'y time dey holler I make dat creetur men' he's gait. Some un um call me a country-ban', en say I runnin' 'way, en ef de pickets hadn't all been runnin' in, I speck dey'd 'a' fetched de ole nigger up wid de guns. But dat never cross my min' dat day.

"Well, ma'am, I haid my hoss de way de pickets comin' fum, en ef dey hadn't er been so much underbresh en so many sassyfac saplin's, I speck I'd 'a' run dat creetur ter def; but I got ter whar I hatter go slow, en I des pick my way right straight forrerd de bes' I kin. I ain't hatter go so mighty fur, nudder, 'fo' I come 'cross de place whar dey had de skirmish, en fum dat day ter dis I ain't never see no lonesome place like dat. Dey wuz a cap yer, a hut yander, en de groun' look like it wuz des strowed wid um. I stop en listen. Den I rid on a little ways, en den I stop en listen. Bimeby I year hoss whicker, en den de creetur w'at I'm a-ridin', he whicker back, en do des like he wanten go whar de t'er hoss is. I des gin 'im de rein, en de fus news I know, he trot right up ter de big black hoss w'at my young marster rid.

"I look little funder, I did, en I see folks lyin' on de groun'. Some wuz double' up, en some wuz layin' out straight. De win' blow de grass back'ards en forrerd, but dem sojermen, dey never move; en den I know dey wuz dead. I look closer, en dar 'pon de groun' 'mos' right at me wuz my young marster layin' right by de side er one er dem Yankee mens. I jumped down, I did, en run ter whar he wuz, but he wuz done gone. My heart jump, my knees shuck, en my han' trimble, but I know I got ter git away fum dar. Hit look like at fus' dat him en dat Yankee man been fightin', but bimeby I see whar my young marster bin crawl thoo de weeds en grass ter whar de Yankee man wuz layin', en he had

one arm un' de man' haid, en de ter han' wuz gripped on he's canteen. I fix it in my min', ma'am, dat my young marster year dat Yankee man holler fer water, en he des make out fer ter crawl whar he is, en den I foun' um bofe.

"Dey wuz layin' close by a little farm road, en not so mighty fur off I year a chicken crowin'. I say ter myse'f dat sholy folks must be livin' whar dey chickens crowin', en I tuck'n' mount my young marster' hoss, en right 'roun' de side er de hill, I come 'cross a house. De folks wuz all gone, but dey wuz a two-hoss waggin in de lot, en some harness in de barn, en I des loped back atter de yuther hoss, en 'mos' 'fo' you know it, I had dem creetur's hitch up; en I went en got my young marster en de Yankee man w'at wuz wid 'im, en I kyard um back ter de camps. I got um des in time, too, kase I ain't mo'n fairly start 'fo' I year big gun, *be-bang!* en den I know'd de Yankees mus' be a-comin' back. Den de bung-shells 'gun ter bus', en I ax myse'f, w'at dey shootin' at me fer, en I ain't never fin' out w'at make dey do it.

"Well, ma'am, w'en I git back ter camps, dar wuz Cunnel Tip Herndon, w'ich he wuz own br'er ter Miss Hallie. Maybe you been year tell er Marse Tip, ma'am; he cert'n'y wuz a mighty fine man. Marse Tip, he 'uz dar, en 'twa'n't long 'fo' Miss Hallie wuz dar, kaze she ain't live so mighty fur; en Miss Hallie say dat my young marster en de Yankee man mus' be brung home terge'er. So dey brung um."

Uncle Prince paused. His story was at an end. He stooped to stir the fire, and when he rose, his eyes were full of tears. Humble as he was, he could pay this tribute to the memory of the boy soldier whom he had nursed in sickness and in health. It was a stirring recital. Perhaps it is not so stirring when transferred to paper. The earnestness, the simplicity, the awkward fervor, the dramatic gestures, the unique individuality of Uncle Prince cannot be reproduced; but these things had a profound effect on Miss Eustis and her aunt.

VII.

THROUGHOUT the narrative the piano had been going — keeping, as it seemed, a weird accompaniment to a tragic story. This also had its effect, for so perfectly did the rhythm and sweep of the music accord with the heart-rending conclusion, that Helen, if her mind had been less preoccupied with sympathy, would probably have traced the effect of it all to a long series of rehearsals; in fact, such a suggestion did occur to her, but the thought perished instantly in the presence of the unaffected simplicity and the child-like earnestness which animated the words of the old negro.

The long silence which ensued — for the piano ceased and Hallie nestled at Helen's side once more — was broken by General Garwood.

"We were never able to identify the Union soldier. He had in his possession a part of a letter and a photograph of himself. These were in an inner pocket. I judge that he knew he was to be sent on a dangerous mission, and had left his papers and whatever valuables he may have possessed behind him. The little skirmish in which he fell was a surprise to both sides. A scouting party of perhaps a dozen Federal cavalrymen rode suddenly upon as many Confederate cavalrymen who had been detailed for special picket duty. There was a short, sharp fight, and then both sides scampered away. The next day the Federal army occupied the ground."

"It is a pity," said Helen, "that his identity should be so utterly lost."

"Hallie, my dear," said Mrs. Garwood, "would it trouble you too much to get the photograph of the Union soldier? If it is any trouble, my child —"

Hallie went swiftly out of the room and returned almost immediately with the photograph and handed it to Helen, who examined it as well as she could by the dim firelight.

"The face is an interesting one, as well as I can make out," said Helen, "and it has a strangely familiar look. He was very young."

She handed the picture to her aunt. Her face was very pale.

"I can't see by this light," said Miss Tewksbury. But Uncle Prince had already brought a lamp which he had been lighting. "Why, my dear," said Miss Tewksbury, in a tone of voice that suggested both awe and consternation, — "Why, my dear, this is your brother Wendell!"

"Oh, Aunt Harriet! I thought so — I was afraid so — but are you sure?"

"As sure as that I am sitting here."

Helen burst into tears. "Oh, why didn't I recognize him? How could I fail to know my darling brother?" she cried.

Hallie rose from her low stool, and stood gazing at Helen. Her face was pale as death, but in her eyes gleamed the fire of long-suppressed grief and passion. She seemed like one transformed. She flung her white arms above her head, and exclaimed:

"I knew it! I knew it! I knew that some poor heart would find its long-lost treasure here. I have felt it — I have dreamed it! Oh, I am so glad you have found your brother!"

"Oh, but I should have known his picture," said Helen.

"But, my dear child," said Miss Tewksbury in a matter-of-fact way, "there is every

"DEY WAS LAYIN' CLOSE BY A LITTLE FARM ROAD."

reason why you should not have known it. This picture was taken in Washington, and he never sent a copy of it home. If he did, your father put it away among his papers. You were not more than twelve years old when Wendell went away."

"Perhaps if Hallie will get the fragment of letter," said General Garwood to Miss Tewksbury, "it will confirm your impression."

"Oh, it is no impression," replied Miss Tewksbury; "I could not possibly be mistaken."

The fragment of letter, when produced, proved to be in the handwriting of Charles Osborne Eustis, and there was one sentence

in it that was peculiarly characteristic. "Remember, dear Wendell," it said, "that the war is not urged against men; it is against an institution which the whole country, both North and South, will be glad to rid itself of."

It would be difficult, under all the circumstances, to describe Helen's thoughts. She was gratified — she was more than gratified — at the unexpected discovery, and she was grateful to those who had cared for her brother's grave with such scrupulous care. She felt more at home than ever. The last barrier of sectional reserve (if it may be so termed) was broken down so far as she was concerned, and during the remainder of her stay, her true

character — her womanliness, her tenderness, her humor — revealed itself to these watchful and sensitive Southerners. Even Miss Tewksbury, who had the excuse of age and long habit for her prejudices, showed the qualities that made her friends love her. In the language of the little rector, who made a sermon out of the matter, "all things became homogeneous through the medium of sympathy and the knowledge of mutual suffering."

In fact, everything was so agreeable during the visit of Helen and her aunt to Waverly — a visit that was prolonged many days beyond the limit they had set — that Uncle Prince remarked on it one night to his wife.

"I'm a nigger man, 'Mandy Jane," said he, "but I got two eyes, en dey er good ones. W'at I sees I knows, en I tell you right now, Marse Peyton is done got stricken."

"Done got stricken 'bout what?" inquired 'Mandy Jane.

"'Bout dat young lady w'at stayin' yer. Oh, you nee'n' ter holler," said Uncle Prince in response to a contemptuous laugh from 'Mandy Jane. "I ain't nothin' but a nigger man, but I knows w'at I sees."

"Yes, you is a nigger man," said 'Mandy Jane triumphantly. "Ef you wuz a nigger 'oman you'd have lots mo' sense dan w'at you got. W'y, dat lady up dar ain't our folks. She mighty nice, I speck, but she ain't our folks. She ain't talk like our folks yit."

"No matter 'bout dat," said Uncle Prince. "I ain't seed no nicer 'oman dan w'at she is, en I boun' you she kin talk mighty sweet w'en she take a notion. W'en my two eyes tell me de news I knows it, en Marse Peyton done got stricken long wid dat white 'oman."

"En now you gwine tell me," said 'Mandy Jane with a fine assumption of scorn, "dat Marse Peyton gwine marry wid dat w'ite 'oman en trapse off dar ter de Norf? *Shoo!* Nigger man, you go ter bed 'fo' you run yo'se'f 'stracted."

"I dunno whar Marse Peyton gwine, 'Mandy Jane, but I done see 'im talkin' 'long wid dat white lady, en lookin' at her wid he's eyes. Huh! don' tell me! En dat ain't all, 'Mandy Jane," Uncle Prince went on; "dat Bud Stucky, he's f'rever 'n' eternally sneakin' 'roun' de house up dar. One day he want sumpin' ter eat, en nex' day he want Miss Hallie fer ter play en de peanner, but all de time I see 'im a-watchin' dat ar white lady fum de Norf."

"Hush!" exclaimed 'Mandy Jane.

"Des like I tell you!" said Uncle Prince.

"Well, de nasty, stinkin', ouldacious villyun!" commented 'Mandy Jane. "I lay ef I go up dar en set de dogs on 'im, he'll stop sneakin' 'roun' dis place."

"Let 'im 'lone, 'Mandy Jane, let 'im 'lone,"

said Uncle Prince solemnly. "Dat ar Bud Stucky, he got a mammy, en my min' tell me dat he's mammy kin run de kyards en trick you. Now you watch out, 'Mandy Jane. You go on en do de washin', like you bin doin', en den ole Miss Stucky won't git atter you wid de kyards en cunjur you. Dat ole 'oman got er mighty bad eye, mon."

VIII.

UNCLE PRINCE, it appears, was a keen observer, especially where General Garwood was concerned. He had discovered a fact in regard to "Marse Peyton," as he called him, that had only barely suggested itself to that gentleman's own mind — the fact that his interest in Miss Eustis had assumed a phase altogether new and unexpected. Its manifestations were pronounced enough to pester Miss Tewksbury, but, strange to say, neither General Garwood nor Miss Eustis appeared to be troubled by them. As a matter of fact, these two were merely new characters in a very old story, the details of which need not be described or dwelt on in this hasty chronicle. It was not by any means a case of love at first sight. It was better than that — it was a case of love based on a firmer foundation than whim, or passion, or sentimentality. At any rate Helen and her stalwart lover were as happy, apparently, as if they had just begun to enjoy life and the delights thereof. There was no love-making, so far as Miss Tewksbury could see, but there was no attempt on the part of either to conceal the fact that they heartily enjoyed each other's companionship.

Bud Stucky continued his daily visits for several weeks, but one day he failed to make his appearance, and after a while news came that he was ill of a fever. The ladies at Waverly sent his mother a plentiful supply of provisions, together with such delicacies as seemed to them necessary, but Bud Stucky continued to waste away. One day Helen, in spite of the protests of her aunt, set out to visit the sick man, carrying a small basket, in which Hallie had placed some broiled chicken and a small bottle of home-made wine. Approaching the Stucky cabin, she was alarmed at the silence that reigned within. She knocked, but there was no response; whereupon she pushed the door open and entered. The sight that met her eyes and the scene that followed are still fresh in her memory.

Poor Bud Stucky, the shadow of his former self, was lying on the bed. His thin hands were crossed on his breast, and the pallor of death was on his emaciated face. His mother sat by the bed with her eyes fixed on his. She made no sign when Helen entered, but con-

tinued to gaze on her son. The young woman, bent on a mission of mercy, paused on the threshold, and regarded the two unfortunates with a sympathy akin to awe. Bud Stucky moved his head uneasily, and essayed to speak, but the sound died away in his throat. He made another effort. His lips moved feebly; his voice had an unearthly, a far-away sound.

"Miss," he said, regarding her with a piteous expression in his sunken eyes, "I wish you'd please, ma'am, make maw let me go." He seemed to gather strength as he went on. "I'm all ready, an' a-waitin'; I wish you'd please, ma'am, make 'er let me go."

"Oh, what can I do?" cried Helen, seized with a new sense of the pathos that is a part of the humblest human life.

"Please, ma'am, make 'er let me go. I been a-lyin' here ready two whole days an' three long nights, but maw keeps on a-watchin' of me; she won't let me go. She's got 'er eyes nailed on me constant."

Helen looked at the mother. Her form was wasted by long vigils, but she sat bolt-upright in her chair, and in her eyes burned the fires of an indomitable will. She kept them fixed on her son.

"Won't you please, ma'am, tell maw to let me go? I'm so tired er waitin'."

The plaintive voice seemed to be an echo from the Valley of the Shadow of Death. Helen, watching narrowly and with agonized curiosity, thought she saw the mother's lips move, but no sound issued therefrom. The dying man made another appeal:

"Oh, I'm so tired! I'm all ready an' she won't let me go. A long time ago when I us' ter ax 'er, she'd let me do 'most anything, an' now she won't let me go. Oh, Lordy! I'm so tired er waitin'! Please, ma'am, ax 'er to let me go."

Mrs. Stucky rose from her chair, raised her clasped hands above her head, and turned her face away. As she did so, something like a sigh of relief escaped from her son. He closed his eyes, and over his wan face spread the repose and perfect peace of death.

Turning again towards the bed, Mrs. Stucky saw Helen weeping gently. She gazed at her a moment. "Whatter you cryin' fer now?" she asked with unmistakable bitterness. "You wouldn't a-wiped your feet on 'im. Ef you wuz gwine ter cry, whyn't you let 'im see you do it 'fore he died? What good do it do 'im now? He wa'n't made out'n i'on like me."

Helen made no reply. She placed her basket on the floor, went out into the sunlight, and made her way swiftly back to Waverly. Her day's experience made a profound impression on her, so much so that when the

time came for her to go home, she insisted on going alone to bid Mrs. Stucky good-bye.

She found the lonely old woman sitting on her door-sill. She appeared to be gazing on the ground, but her sun-bonnet hid her face. Helen approached and spoke to her. She gave a quick upward glance and fell to trembling. She was no longer made of iron. Sorrow had dimmed the fire of her eyes. Helen explained her visit, shook hands with her, and was going away, when the old woman, in a broken voice, called her to stop. Near the pine-pole gate was a little contrivance of boards that looked like a bird-trap. Mrs. Stucky went to this and lifted it.

"Come yer, honey," she cried, "yer's somepin' I wanter show you." Looking closely, Helen saw molded in the soil the semblance of a footprint. "Look at it, honey, look at it," said Mrs. Stucky; "that's his darlin', precious track."

Helen turned and went away weeping. The sight of that strange memorial which the poor mother had made her shrine, leavened the girl's whole after life.

When Helen and her aunt came to take their leave of Azalia, their going away was not by any means in the nature of a merry-making. They went away sorrowfully and left many sorrowful friends behind them. Even William, the bell-ringer and purveyor of hot batter-cakes at Mrs. Haley's hotel, walked to the railroad station to see them safely off. General Garwood accompanied them to Atlanta, and though the passenger depot in that pushing city is perhaps the most unromantic spot to be found in the wide world,—it is known as the "Car-shed" in Atlantese,—it was there that he found courage to inform Miss Eustis that he purposed to visit Boston during the summer in search not only of health, but of happiness, and Miss Eustis admitted, with a reserve both natural and proper, that she would be very happy to see him.

It is not the purpose of this chronicle to follow General Garwood to Boston. The files of the Boston papers will show that he went there, and that, in a quiet way, he was the object of considerable social attention. But it is in the files of the "Brookline Reporter" that the largest and most graphic account of the marriage of Miss Eustis to General Garwood is to be found. It is an open secret in the literary circles of Boston that the notice in the "Reporter" was from the pen of Henry P. Bassett, the novelist. It was headed "Practical Reconstruction," and it was conceded on all sides that even if the article had gone no further than this, it would have been a very happy description of the happiest of events.

THE AMERICAN GAME OF FOOT-BALL.

A TOUCH-DOWN.

HOWEVER odd the title of this article may seem, its implications are correct and legitimate. The undergraduates of American colleges, taking the so-called Rugby game of foot-ball, have developed it into a game differing in many of its phases from any of its English prototypes. There were already differences in the game in its primitive home. Kicking the ball was, of course, common to all; but there was, further, the so-called Rugby game, whose leading feature, speaking roughly, was that the player might run with the ball; there was the Association game, in which, speaking as roughly, the player might "charge," that is, run against, an opponent and might not run with the ball; and there were a dozen other variants of the game. The peculiar feature of the Rugby game was the "scrummage," of which more will be said farther on; and American players, working out the scrummage into a new form, have

changed the possibilities of the game very greatly, and have made it, in addition to its individual opportunities for the exhibition of skill, one of the most scientific of outdoor games in its "team-playing," or management of the entire side as one body. It would be impossible, within the limits of this article, to enter into a technical explanation of the finer points of this team-play, or to give a minute statement of the rules of the game; all that can be hoped for is to give him who witnesses the American game some general knowledge of it, so that he may follow it with intelligence and enjoyment.

On entering the ground and securing his post of observation, the spectator will see before him a field 330 feet long and 160 feet wide. The shorter line is the "goal-line." Across the field, at intervals of five yards, are white lines parallel to the goal-lines; these are meant to guide the umpire in the imposition of penalties for fouls, off-side playing, or delaying the game, the penalty being commonly a loss of five yards by the side which

is in fault. In the middle of each goal-line is the "goal," two upright posts 18½ feet apart with a cross-bar 10 feet from the ground. In order to score a goal, the ball must pass between the uprights and over the cross-bar, and must cross it from a "place-kick," or from a "drop-kick,"—that is, from a kick made just as the ball is leaving the ground, not from a "punt," a kick made while the ball is in the air. Each side, while defending its own goal, necessarily faces the goal of its opponents, and its object is to advance the ball, by running with it or by kicking it, toward its opponents' goal-line, to plant the ball on the ground on the other side of the opponents' goal-line, which constitutes a "touch-down" and scores four points in the game, and to kick the ball over the cross-bar of the opponents' goal or force the opponents to make a "safety" touch-down in their own territory. When a touch-down is made, the successful

RUNNING WITH THE BALL

side takes the ball any distance it wishes straight out into the field, its opponents remaining behind their goal-line until the ball is kicked. One man, lying on the ground, holds the ball in proper position; another, when the ball is dropped to the ground, kicks it; if the ball goes over the cross-bar, it counts two points in addition to the four points for the touch-down, and, if the goal is missed, it counts nothing. A touch-down and a successful goal thus count together six points; a goal kicked from the field, without a previous touch-down, counts five points; and a "safety" touch-down counts two points against the side which makes it.

The feature in this process of advancing the ball which is most difficult for even the practiced eye to follow, and which will probably always remain a profound mystery to the unskillful, is the prohibition of "off-side playing." The general principle, however, is not difficult of comprehension: it is merely that no player has legal rights when he is between the ball and his opponents' goal; he is then "off-side" until the ball has touched an opponent, or one of his own side carries the ball ahead of him or runs in front of him, having touched the ball while behind him. So long as he is "off-side," a player must not interfere with the ball or with his opponents. The players of both sides are so continually on- and off-side that it is hardly possible to follow the process. A line of men comes charging down the field: the ball is kicked back over their heads, and they are all technically off-side. In an instant the ball is kicked back again, and they are all on-side again and entitled to play, since the ball has touched one of their opponents. The shifting is often so rapid and constant that the men themselves almost come to forget the prohibition until one of them happens to play

DIAGRAM OF THE FIELD

A GOAL.

at a moment when he is off-side, and then the imposition of a penalty, the loss of five yards by his side, recalls him to a sense of the rules of the game.

"Passing" the ball, or throwing it from one to another, is another feature of the game. Hardly any combination of team-playing and individual skill is more noteworthy than the sight of a first-rate team carrying the ball down the field, each player taking his turn in running with the ball, and, when hard pressed, passing it over the head of an opponent to one of his own side, more fortunately situated, who carries it farther. Considering that the egg-shape of the ball makes it the concentrated essence of irregularity, that only the most skillful player can even hazard a guess at the direction which it will take after a bound, and that an error of but an inch in the direction of a

throw may carry the ball a dozen feet away from the place at which it was aimed, one may be pardoned for admiring the certainty with which individuals and teams make each point of play and combine them all into an organized system. Passing has also its phase of off-side playing. A "pass forward" is not allowed, and is a foul; the ball must be thrown straight across the field, parallel to the goal-line, or in any direction back of that line.

Hitherto we have been looking at the game only from the standpoint of the side which is advancing the ball. It is not to be supposed that its opponents are idly watching the ball's progress: it is their object to check the advance of the ball, and to retort by advancing it in their turn and toward their objective point,—the opposite goal. One way of doing this is by a "fair-catch," or, in base-ball language, a "fly-catch," of a kick or throw from an opponent, provided he who catches the ball makes a mark with

his heel while catching, and does not move from it until the catch is admitted. The mark is then the dividing point between the two teams; both take position between it and their own goals; and the player who caught the ball kicks it back toward the opposite goal, usually by a "punt." The more common way of checking the advance of the ball is by a "tackle." Any player may run with the ball. While he is doing so, any opponent may seize him and cry "Held!" or throw him and hold him until he cries "Down!" If the tackle is made by seizing the runner above the shoulders or below the hips, it is a "foul tackle," and penalties are imposed for it. If it is a fair tackle, it effectually blocks the further progress of the ball; the game is stopped for the moment; and some means must exist for putting the ball into play again and resuming the

A FAIR-CATCH.

A FOUL TACKLE, LOW.

game. This brings us to the peculiar feature of the American game, the "scrimmage."

In the English game, the scrimmage consists in placing the ball on the ground, after which both sides crowd around it and kick indiscriminately and furiously until the ball emerges and is carried off by one of the players. The game had hardly been introduced into America when the new players saw that the English scrimmage was altogether illogical; it was certain that one or more of the players would be off-side during the process. A new form of the scrimmage was developed at once. The enforcement of the rule against off-side playing, together with the natural desire of the players to get as near as possible to the opposite goal, led to the arrangement of the two sides in parallel lines, neither being ahead of the ball; and this was the origin of "lining-up" at the beginning of the American scrimmage. The ball is placed on the ground; side A, which has the ball, forms in a line, no player being allowed to get ahead of the ball, that is, to be off-side; side B forms in a parallel line as near as convenient to the line of side A; the player in the center of A's line, the "center rush," kicks the ball backward, or "snaps it back," to the quarter-back, who "passes" it to another player: and the ball is "in play" again, side B trying to break through in pursuit of it, and side A trying to prevent this by getting into the way, any holding or striking being absolutely forbidden. The bulk of the game is thus made up of occasional kicks and free catches, and a great deal of running with the ball, tackles, and consequent scrimmages. When the ball goes outside of the side-lines, it is put into play again in much the same way as in the scrimmage. The two sides "line up" at right angles with the side-

line; a member of side A, which has the ball, standing astride the side-line, either throws the ball straight in, over the heads of the players, or, more commonly, bounds it backward to one of his own side, and the ball is in play.

The introduction of the American form of the scrimmage has quite changed the character of the game. It soon forced a reduction of the numbers engaged, from fifteen on a side to eleven, which has since been the rule. Every subsequent development of the game has made it more scientific and more difficult to play with the highest success. The game has, in fact, become a miniature game of strategy, and can best be comprehended by comparing the football-field to a battle-field, limited by the side-lines, and the respective sides to two armies, managed on military principles by the captains. Four arms of the football service have been developed, as the spectator may see on watching two teams lining-up at the beginning of a game, or at the beginning of a scrimmage. Across the field stretch the football infantry, the "rush-line," or "rushers." They are the seven heavy men of the team, but must also be agile, very fair runners, and quick in tackling. Their most powerful player is usually in the middle of the line, and is commonly known as the "center-rush": he snaps the ball back in the scrimmage. The two players on the ends of the line, the "end-rushes," stand slightly back of the main line,—in more military language, "the wings are slightly refused,"—in order to tackle any player who may succeed in passing the main line at those points. Behind the "center-rush," generally, plays the "quarter-back," answering very much to the quartermaster's department: he takes the ball from the "center-rush," in the scrimmage, and serves it out to the players back of him, who are to do the running.

A FOUL TACKLE, HIGH.

A FAIR TACKLE.

He is usually smaller than the rushers, but must be uncommonly active and clear-headed, capable of meeting very hard usage, and of occasionally making points regularly belonging to any of the other departments of the team. The Princeton and Yale quarter-backs of the past two years, Hodge and Beecher, playing quite different types of the game, are probably the best of those who have ever held the position. Behind the quarter-back, and covering the two sides of the field, are the "half-backs," the cavalry of the team. They are the runners *par excellence*: all must be runners, but these more than any of the others. They are the ones to whom the quarter-back usually passes the ball at the beginning of a scrimmage, and the one to whom it is passed either makes a straightforward dash for an opening in the enemy's line made for him by his own rush-line, or, more commonly, flanks the opposing line, having due regard to the side-lines of the field, and endeavors to carry the ball as far as possible into the enemy's territory before he is tackled and "downed." The most brilliant playing is done by the half-backs. They must be strong not only in running, but in dodging;

and it is not uncommon to see a first-rate half-back carry the ball almost or quite the full length of the field, dodging one opponent here and another there, thrown headlong again and again, but up and away before the tackle can be completed, and finally score a touch-down, while the heavier rushers, who have grasped at him and missed him, toil panting and disgusted after him in hopes of another opportunity. Farthest to the rear, and at first in front of his own goal, is the eleventh player, the "full-back." He constitutes the artillery of the team. He is to relieve a too-great pressure on his team by an opportune punt over the heads of the line, while his rushers follow the ball down the field, ready to tackle any opponent who secures the ball, cause a "down," and thus transfer the struggle to the enemy's territory.

One who gets the full force of the military nature of the American game of foot-ball will have comparatively little difficulty in following intelligently the real course of the game, even though he be quite ignorant of many of the more minute points, of the difference between a "kick-off" and a "kick-out," between a "punt-on" and a "punt-out," or between a "kick-over" and a "touch-down." He will see the real beauty of the team-play, and the individual play, skillful as it may be, will pale before it. He will be able to appreciate the real strategy with which the opposing captains handle the respective arms of their service, pitting cavalry against infantry here, scattering cavalry by infantry there, or using the artillery to search out the weak points of the opposing team by long punts into their territory. The "noise of the captains and the shouting" will take on a new significance to him, and he will no longer wonder that the American undergraduate takes such an intense interest in his own game of foot-ball.

Individual playing is done mainly by the half-backs, as has been said, and their work is that which usually brings their college's

QUARTER-BACK TAKING THE BALL.

undergraduates nearest to a state of semi-delirious enthusiasm. The best example was the game of 1885 between Princeton and Yale. Watkinson, one of the Yale half-backs, excelled in punting and in the accuracy of his drop-kicks; Lamar, one of the Princeton half-backs, and the finest player whom his college has ever put into that position, excelled in running and more especially in dodging.

to defeat; he might then, perhaps, even sympathize with the Princeton man who, when the ball was brought out for the kick at goal, covered his eyes with his hands, saying faintly to those around him, "Fellows, tell me when it's over!"

Feats like "Lamar's run" are of course the exhilarating element of the game; the solid beef and pudding, which wins a series of

THE SCRIMMAGE. HALF-BACK TAKING THE BALL.

Toward the end of the first half of the game, and after half a dozen misses, Watkinson at last sent the ball flying over Princeton's goal by a drop-kick from the field, scoring five points. For the rest of the game, the two evenly matched teams struggled desperately, Princeton to score something, Yale to prevent it; and, when less than ten minutes' playing-time remained, Yale was still successful and the score was 5 to 0 in her favor. In an instant, the whole aspect of affairs was changed. One of Watkinson's long punts crossed the field diagonally, throwing the Yale line out of alignment for the moment. Lamar caught the ball while running at full speed, and went like a flash between two of the Yale rushers, entrapped one of the half-backs into missing tackle, and dodged another; and lo! the whole field was before him, without an opponent between him and the much-longed-for Yale goal. A touch-down and a goal followed; and the team which seemed assured of the game but a moment before had lost it by a score of 6 to 5. He who "cannot understand the popularity of foot-ball" should have been there to witness the frantic excitement, the cheers, the embracings, and the general delirium of those spectators who were but a moment ago resigned

games, is the team-playing; and the development of this is in the handling of the infantry, the rush-line. A good half-back of five or six years ago could, with the necessary physical characteristics, play almost as good a game now; but the rush-line of to-day would completely outwit and reduce to nullity the strongest rush-lines of the past. "Rush-line tricks" are the leading feature of the modern form of the game; against an unskilled team they are deadly, and score touch-downs and goals with bewildering rapidity. Instead of passing the ball from a scrimmage to a half-back, the quarter-back will hold it for an instant until one or another of his rush-line takes it from him and charges with it. But the clock-work precision with which the whole matter is managed, the manner in which every other player of the rush-line supports the one who has the ball and does just the work necessary to help him break the opposing rush-line, show that nothing has been left to chance. Such "rush-line tricks" are possible only through perfectly organized team-play, and an ingenious system of signals. The spectator, during the scrimmage, can hear an almost constant flow of conversation from the captain to his men, exhortations to "play hard," or "put

the ball through," or apparently superfluous information on every kind of subject connected with the game. He is really managing his team, telling them to whom the ball is to be passed next by the quarter-back and what players are to do special pieces of work connected with the play. Every sentence has its pregnant word, conventionalized to mean to the players something quite different from the meaning which the opponents will probably attach to it; and the whole system, carefully memorized and practiced for weeks, enables the captain to keep his team well in hand throughout the game. Each team has its pet system of signaling, which it fondly imagines to be undiscoverable; while the first few minutes of a "great" game are spent in studying the signals of the opposing team, to see whether they have been changed since the last season.

Under its new form, the game has taken a high place in the affections of the American

no other form of exercise. Every spectator knows that the players are in the acme of physical condition, and that they are able and more than willing to strain every muscle to the breaking point rather than allow their rivals to outscore them. Every student as well as every player knows that the playing of the team, rather than its success, will go far to measure the college's reputation for every physical characteristic which goes to make up a man, and for those psychological traits which have so great a weight on the exhibition of mere physical powers. Wesleyan and Pennsylvania have a pride in showing how well their teams can play. Harvard, though unfortunate for the last few years, has put her mark too high in the past to be willing to fall below it. Yale wants three championships at least. Princeton having no Medical School or Law School from which to draw graduate players, has a pride in showing that her undergraduates can fill the lack. College feeling, in its

OUT OF BOUNDS — PUTTING BALL INTO PLAY.

undergraduate. In the three colleges in which it is played most successfully, Yale, Harvard, and Princeton, the undergraduates would probably give up base-ball a trifle more willingly than foot-ball. There is enough in the game to stir one's pulses. The training has been a long period of self-surrender and of self-denial, and it has enabled the players to show courage, constancy, an intelligent willingness to meet and defeat physical dangers, and an ability to think connectedly in the presence of physical dangers, to an extent offered by

most intense form, permeates the whole season, and is not confined to a twenty minutes' dash for victory or a tedious procession. Yet one who played the game in the past, and likes it not a whit the less in the present, must feel regret in seeing the general disposition to consider the game one which is objectionable as a game for students who are gentlemen. The criticisms upon it have run in two general lines, though they have branched out into many different phases. They are, first, the innate roughness of the game, and

the likelihood of severe accident, or even death, from it; and, second, its tendency to degenerate into brutality and personal combat, from the personal contact between the players, which is an inevitable feature of it.

The first point has its true and its false side. The game is as safe as any outdoor game can well be, provided it is played with the careful preparation and training which are the rule in the larger colleges. It is a dangerous and unfit game when men undertake to play it without such preparation and training. In the season of last year, two fatal accidents were reported; both occurred in colleges which were attempting to play the game as it is played by the leading teams, without any of the preparation which they find an essential. The writer, who has been in the habit of attending the regular games of the college with which he is connected, has felt under obligations to be equally consistent in attending the daily practice games of the men, in order to watch the preliminary training; and he must confess to a great respect for the good sense and good management of the undergraduates who have the matter in charge. The "University team" is selected provisionally; it is pitted daily against a second, or "scrub," team of somewhat larger numbers; both teams are kept under careful training and supervision; the playing is made short and as gentle as possible at first, until the men begin to become "hard"; the playing is then gradually lengthened and made more severe, as the men become able to endure it; and, by the time the season comes to its last game, the players are able to endure with impunity treatment which would be dangerous to men who are "soft," or out of condition. After the first few weeks are over, and serious playing has begun, men who have not yet played are not encouraged, or, in extreme cases, even allowed, to play on the "scrub" team; the managers think it inadvisable to run any risks. The players are not only brought to a point of physical condition which makes it a pleasure to watch them; they are taught how to fall, when a fall is inevitable, in such a way as to retain control of the ball without hazarding a broken bone or a dislocation. When the closing games come on, the player can take what seems to the spectator a frightful fall not only without a bruise, but so skillfully that it is regularly necessary for his opponent to "hold him down" lest he rebound and take to his

heels again. The preliminary practice games can hardly be more severe elsewhere than at Princeton, and yet the writer has never seen a serious accident occur there. An accident may occur, of course, and will give no warn-

DROPPING ON THE BALL.

ing of its coming, but its coming has been put as far as possible out of the range of probability. But if men in other colleges wish to play foot-ball, as should be the case, they must not ignore the systematic course of preparation, take the final playing of a well-trained team as a model, and attempt to imitate it. It is from such folly that the recurring accidents in foot-ball come. With good physical condition in the players, the requisite training, and suitable grounds, the game is not only one of the best of outdoor sports, but one of the safest.

The asserted tendency of the game to degenerate into personal combat is at least as serious a question; and it has much the same answer. The writer's observation has led him to believe that, in nine cases out of ten, a general tendency to indulge in striking with the fist is the result of conscious inferiority. When a team finds itself constantly outwitted by the team-play of its opponents, it is apt to become exasperated and to be tempted into striking; while the captain who is managing his team as a whole would be annoyed and interfered with by a disposition on the part of any of his men to abandon their functions in his plans and turn to a personal assault on the opponents. From this point of view, the natural development of the game into team-playing is itself a corrective to any tendency to blows; a successful team can no longer afford to indulge in individual combat. The belief is confirmed by the testimony of players. They say that difficulties of this sort come only in the minor games; and that, in the

BREAKING THROUGH THE RUSH LINE

J.R. Miles

games with the stronger teams, toward the end of the season, where the teams are played strictly as units, the tendency to strike is very far less and may generally be disregarded.

An influence of a somewhat higher moral nature is the fact that the intensity of the later competition has made every prominent football player known to his rivals in other colleges. They canvass all his characteristics, his methods of play, and their fair or foul character. He knows that he is to meet them in after life, and is to leave a reputation among his contemporaries, not only in his own college, but in other colleges. He is not over-anxious to make that reputation one for foul dealing, ugly temper, and brutality; and the natural results of this better acquaintance are telling more for good every year. Still, it must always be admitted that the game offers more provocatives to a naturally bad temper than any other outdoor sport. The credit of those who learn to undergo such discipline and to con-

trol their tempers under such provocatives should be the greater; but an artificial restriction may be of service even to them. Until this season every umpire has been much restrained from inflicting the penalties prescribed by the rules, from the fact that the undergraduates of the injured college would ascribe a defeat to him. It is for this reason that the effort has been made, with the concurrence of the undergraduates themselves, to transfer the appointment of such umpires to a graduate committee, so that they will be removed from all sense of responsibility to the undergraduates.

Even in past years, very far the most of the striking has been quite imaginary. The player who has the ball is permitted to thrust off any one who attempts to tackle him; but such "warding-off" must be done with the open hand only. The reporter or spectator who sees a stalwart player running down the field, one arm holding the foot-ball,

LINING UP.

while the other is moving with the rapidity of a steam-engine's piston toward and from an opponent, asks no further testimony than "that of his senses" that this is another scandalous case of "slugging," as striking has come to be called. If he should look a little closer, he would see that the "striker's" hand was open and the fingers up, so as to make any real striking impossible. Again, at the beginning of a scrimmage, the proximity of the two lines gives an appearance of constant striking. One team is on a line with the ball; the other is parallel to the first, at such distance as pleases it. Theoretically each side has a right to be on a line with the ball, so that the line between the two sides ought to be geometrical, or imaginary. In practice, however, only the side which has the ball can play on an exact line with it, but the other side naturally presses as close as possible to the theoretical dividing line. Until the ball is snapped back, the side which has the ball is continually thrusting its opponents back, but the action is precisely the same as in "warding-off." In either case, the spectator who wishes to know whether there is real striking or not must watch *the hand*, and not the motion of the arm, or he may do extreme injustice to young men who are undergoing successfully a severe trial of temper, and overcoming temptations which most of the spectators could not endure, and who deserve credit for it.

The real evil of the game is the betting. It is not true that the number of those who bet is large; and it is true that it is far more the graduates than the undergraduates who bet; but it must be admitted that the fact of the betting is demoralizing, both to those who bet and to the team. It is said by some that a college should not concern itself with the question whether men bet on intercollegiate games or not. It is the name of the college which brings the spectators, and the opportunities for and temptations to betting; and the writer must admit the right of the college to stop the use of its name for any such purpose. He would not be understood, however, as wishing to see the college exercise this right, and thus lose the great benefits of intercollegiate athletics. He would far prefer to ground an appeal to the undergraduates to put down betting on the purely material side of the good of the game,—partly from the fact that, if the game becomes a mere medium for betting, it will be a public nuisance, and ought to be suppressed; and partly from its effects on the team and its playing.

It is not the fault of the college periodicals that there is any betting among undergraduates; their influence has been cast strongly and persistently against the whole vicious system.

Their editors are usually among the most judicious of the undergraduates, and they know the dangers which surround the game at present, and have been persistent in warning students against this particular evil of the game. It is to their influence that we have most reason to look with hope for a development of right feeling on this point among undergraduates; and it is only from undergraduates that any strong influence can be brought to bear upon graduates.

Three colleges, Princeton, Yale, and Harvard, are the leading foot-ball institutions at present. With them, the whole foot-ball season, from the beginning of the college year until Thanksgiving Day, is crowded with foot-ball games,—the intercollegiate matches, class games, games between eating and other clubs and between societies. The man who does not "kick" to some extent in the course of the season is quite an exception. Every man in college is, or considers himself, a competent critic of the captain's methods; and every step in the training of the team and the development of its style of play for the season is watched with the keenest scrutiny, and, in its turn, has its influence on the minor games. All this is the chief argument for intercollegiate athletics, in that they oust for the time the "forbidden and abhorrent forces" which are always lying in wait for the recreations of college students, and carry the interest off into the direction of healthy, outdoor sports. From this point of view, no game can claim a higher place than the American game of foot-ball. Not every man can own a shell; and the percentage of cost per man to the healthy results of a boat-race would startle any one who should attempt to figure it up. But any twenty-two men who can combine to own a foot-ball, and to procure a place in which to play, have a whole season of sound and attractive exercise in this one "bag of wind." Let them once become interested in the game, and their spare time goes to it; they will have none left for demoralizing amusements. Cases of serious discipline are more rare during the foot-ball season than in any other part of the college year; and, so far as the writer's observation has gone, the most strenuous supporters of the game among college faculties are those who have most to do with college discipline.

But how about those who spend more time in such amusements than they can really spare? This question is asked more often than any other; and those who ask it do not seem to recognize the injustice to the modern college faculties which is implied in it. The development of the American college is not in a direction which makes the implications

of the question possible. It is less possible every year for a man to waste his time, and yet remain in college. The increase of numbers alone has made the process of "weeding out" incompetent or lazy men in freshman year more of a possibility, and more of a feature in college life; and the influence of this process lasts throughout the course. The "high-class man" who gets on a football team is thereby compelled to organize his time more carefully, to cut off every other drain upon it, and to give spare time to nothing else; the man of less ability is compelled to follow a course as nearly parallel as his ingenuity will enable him to take; and the effects are somewhat like those which high taxation often has on a people, in bringing out more work than would be the case without it. The organization of athletics has a parallel effect. The undergraduate managers of a successful foot-ball team now form a strong organization, which watches the course of promising players with a care which a college professor is not always in a position to give; and it will go to almost any lengths of pressure upon a player rather than allow him to forfeit his place in college through waste of time. The hopelessly athletic student thus gets less mercy every year; and the influences which college athletic organizations bring to bear upon such students, the ingenious expedients by which they extort study from men who do not incline to study, are among the most instructive features of college life, to those who know of them. They fail again and again, of course; but they do a work to which any other agency is incompetent.

The game has found little favor at the South, but almost every Northern college now plays it more or less. The Intercollegiate Foot Ball Association, founded in 1876, consists of the three colleges named above, Wesleyan University, and the University of Pennsylvania. Each team plays one game with each of the other four teams during the season, the last game falling to the two teams which stood highest during the previous season. For the past few years these two teams have regularly been those of Yale and Princeton; and these two are to be the contestants this year. This is always the great game of

the year; the two teams come to it, usually, with an unbroken record of victories over all their other opponents; and the result of the game is to decide the championship for the coming year.

No prudent man will ever venture into the question of the past championship records of the two leading opponents. The championship rules of the Association have been so loose and unsystematic, and have offered so many opportunities for disputes, that the newspaper statements of the championships of past years are quite worthless. Most of the opportunities for dispute seem now to have been covered, and it is to be hoped that the present year will see a clear and undisputed victory for one side or for the other.

It would be far easier to write a "vivid" description of this final game than of all the boat-races that ever were rowed; the excitement is more prolonged; the ups and downs of the game are constant and never to be foreseen; and the points of individual and team playing are vastly more numerous, more perceptible, and more easily apprehended. The enormous crowd, the coaches filled with men and horns, the masses and shades of color among the spectators, the perpetual roar of cheers, including the peculiar slogans of almost all the Eastern colleges, combine to make up a spectacle such as no other intercollegiate game can offer; while the instant response of the spectators to every shifting phase of the play shows that a very large number of them have enjoyed the advantage of a good foot-ball training in the past. But, to him who really likes the game, and who understands its possible influence on the development of Americans, the excitement, the cheers, the blowing of horns, and the ebb and flow of the game, count for little. There is, instead of them, a feeling of thankfulness for the antecedent process of which all this is only a symptom, and a moving force for the coming year; a satisfaction in knowing that this outdoor game is doing for our college-bred men, in a more peaceful way, what the experiences of war did for so many of their predecessors in 1861-65, in its inculcation of the lesson that bad temper is an element quite foreign to open, manly contest.

Alexander Johnston.

TWELVE YEARS OF BRITISH SONG.*

THE TYPICAL VICTORIAN PERIOD.

IN respect to the poetry of Great Britain, the fancy may be indulged that this year's festivals not only celebrate the rounding of a brilliant and distinct period, but stand for a kind of Secular Games as well.

It is just a century since Burns and Coleridge and Wordsworth were in the joy of that new dawn, when

"To be young was very heaven";

and no other land than theirs, meanwhile, has shown a more unbroken procession of imaginative poets. There was a brief nooning between the early and later rehearsals, but the music of great voices has never wholly stopped. This still is heard, though more than a decade of years ago it seemed, and rightly, as if the typical Victorian era were complete. But in the summer of the North the last hours of a day whose wings of light come near to touching its successor's,—although the winds fall and the chief workers mostly go to rest,—have a luster of their own. The survival of influences that long since became historic is a chance coincidence with the prolongation of a fortunate reign, and due to veteran leaders whose strength has been more than equal to their day.

Tennyson and Browning, although two generations of younger men pay homage to them, have been, with the exception of Swinburne, the most unflagging poets of the recent interval. Moreover,—and maugre the flings of wits who judge them by trifles and failures, and who neither care for nor comprehend their important work,—they have given us much that is up to the standard of their prime. In no respect have they been superannuated or piping out of date,—little as they have had to do with the jest and prettiness, the vivacious experiments, with which youth busies itself ere an hour comes for serious attention to the conduct of a new movement.

Yet if literary eras, like those of Elizabeth and Anne, are characterized by a special style or spirit, that for which the Victorian is already historic, on its poetic side, results from certain idyllic and reflective tendencies, with their in-

terblendings and outgrowths. It ceased to be dominant before 1875, going off, as I pointed out, into æsthetic neo-Romanticism on the one hand, and a sub-dramatic or psychological method on the other. If life may be judged by its mature and most prolonged activities, the Victorian school will be recognized as we have recognized it. It is beyond ordinary precedent that its two chief poets are still in voice, and still preëminent. Of Browning it may be said that he has bided his time, and now is the master of an enthusiastic following. But even Tennyson has charged his later idylls with passion, and succeeded in making at least his lyrics dramatic. On the technical side, recent craftsmen take their cue from the forms, melody, color of Swinburne and Rossetti. What differs and is strictly novel, though much in vogue, seldom aspires to the higher range in which these elder leaders have moved almost alone.

The conjectural length of a poet's life doubtless is not yet reckoned in the tables of insurance actuaries. But the longevity of modern poets really seems to have been governed by their mental cast. The romancers, and the lyrists of great sensibility or intense experience, quicken their heart-beats and often have died young. Many poets of "self-reverence, self-knowledge, self-control," whose intellect is the regulator of well-ordered lives, have lived long: such men as Emerson and Longfellow in America,—as Wordsworth, Tennyson, and Browning in England. The recent drift—and they have strengthened it—has been toward the rule of intellect over passion, and the brain-power of such masters has maintained them in wonderful vitality and productiveness to an advanced age.

However this may be, the most suggestive portion of the record now before us is that concerned with the last-named poets. England alone can now boast of two so equal in years and fame, yet so distinct in genius, and still producing works unsurpassed by the efforts of their juniors. Like two noble galleys they still head the fleet, and with all sails spread, though the mists of an unknown sea are straight before them. As for the laureate, all England knows him by heart. Successive ranks of generous and cultured youth have doted on his works, so that his gradual age is watched and understood, somewhat as in a family the

originally appeared in this magazine. From the sections here given, the writer's notices of many poets, dramatists, etc., are necessarily omitted.

* This paper consists of extracts from a forthcoming Supplement to the next edition of "Victorian Poets,"—a book first published in 1875, much of whose contents

bodily and mental changes of its revered master are observed by the household. At times his verse, and oftener than that of his more dramatic compeer's, has sprung from sudden outbursts of feeling, and never more so than in the fine heat and choler of his later years. New readers may not comprehend these moods, but they are intelligible to those who have owed him so much in the past, and do not affect our judgment of his long career.

TENNYSON.

A GOOD deal of force has been expended by the laureate to disprove the claim that he would not greatly excel as a dramatist for either the closet or the stage. His mental and constructive gifts are such that, if he had begun as a "writer of plays," he doubtless would have been successful,—but never, I believe, could have reached his present eminence. His first drama, "Queen Mary," seemed to confirm an early prediction that he might yet produce a tolerable work of that kind, though only by a *tour de force*. Since then, through sheer will and persistency, he has composed a succession of dramas, historical and romantic; but neither will nor judgment, nor the ambition to prove his mastery of the highest and most inclusive form of literature, has enabled him in the afternoon of life to triumph as a dramatist. The first actor of England, with matchless resources for theatrical presentation, was able more than once to make the performance of a play by Tennyson a notable and picturesque event, but nothing more; nor have those produced with equal care by others become any part of the stage repertory. There are charmingly poetic qualities in the minor pieces, and one of them, "The Cup," is not without effects,—but even this will not hold the stage,—while "The Falcon" and "The Promise of May" are plainly amateurish. They contain lovely songs and trifles, but when a great master merges the poet in the playwright he must be judged accordingly. "Harold" and "Becket" are of a more imposing cast, and have significance as examples of what may—and of what may not—be effected by a strong artist in a department to which he is not led by compulsive instinct. Their ancestral themes are in every way worthy of an English poet. "Harold," in style and language, is much like the Idylls of the King, nor does it greatly surpass them in dramatic quality, though a work cast in the standard five-act mold. There is a strong scene where the last of the Saxon kings is forced to swear allegiance to William of Normandy. As a whole, the work is conventional, its battle-scenes reminiscent of Shakspeare and Scott, and the diction tinged with the

author's old mannerisms. "Becket," seven years later, is his nearest approach to a dramatic masterpiece, and at a different time might have ranged itself in stage-literature. It is quite superior, as such, to pieces by Talfourd, Knowles, etc., that are still revived; but this is poor praise indeed for one of Tennyson's fame, and assuredly not worth trying for. It must be admitted that years of self-abstraction, of intimacy with books and nature, are not likely to develop the gift of even a born novelist or dramatic poet. Human life is his proper study: his task the expression of its struggle, passion, mirth and sorrow, virtue and crime,—and these must be transcribed by one that has been whirled in their eddies or who observes them very closely from the shore.

In striking contrast, Tennyson's recent lyrical poetry is the afterglow of a still radiant genius. Here we see undimmed the fire and beauty of his natural gift, and wisdom increased with age. What a collection, short as it is, forms the volume of "Ballads" issued in his seventy-first year! It opens with the thoroughly English story of "The First Quarrel," with its tragic culmination,—

"And the boat went down that night,— the boat went down that night!"

Country life is what he has observed, and he reflects it with truth of action and dialect. "The Northern Cobbler" and "The Village Wife" could be written only by the idyllist whose Yorkshire ballads delighted us in 1866. But here are greater things, two or three at his highest mark. The passion and lyrical might of "Rizpah" never have been exceeded by the author, nor, I think, by any other poet of his day. "The Revenge" and "Lucknow" are magnificent ballads. "Sir John Oldcastle" and "Columbus" are not what Browning would have made of them; but, again, "The Voyage of Maeldune" is a weird and vocal fantasy, unequally poetic, with the well-known touch in every number. Five years later another book of purely Tennysonian ballads appeared. Its title-piece, "Tiresias," may be classed with "Lucretius" and "Tithonus," yet scarcely equals the one as a study, or the other for indefinable poetic charm. "The Wreck" and "Despair" are full of power, and there are two more of the unique dialect-pieces, "To-morrow" and "The Spinster's Sweet-arts." A final Arthurian idyll, "Balin and Balan," is below the level of the work whose bulk it enlarges. "The Charge of the Heavy Brigade," much inferior to the Balaklavan lyric, shows that will cannot supply the heat excited by a thrilling and instant occasion.

A poem in this volume, "The Ancient Sage," consists of speculations on the Nameless,—

and on the universal question which presents itself ever more strenuously as life's shadows lengthen. In this sense, it is of kin to Browning's "Ferishtah" and "Jochannan Hakkdash." Still more noteworthy is the impetuous elegiac, "Vastness," written in 1885, and as yet not placed in a collection. The persiflage bestowed upon this, and afterward, in various quarters, upon the second "Locksley Hall," proclaimed the rise of a generation not wonted to the poet's habit of speech; more, it revealed one out of patience with its creeds, and consoling itself by avoiding resolute thought upon what confronts and challenges our mortality. Tennyson, smitten by the death of a friend, reflects that not here alone dear faces steadily vanish,—but

"Many a planet by many a sun may roll
with the dust of a vanish'd race."

In the knowledge of this, what are all our politics, turmoil, love, ambition, but "a trouble of ants in the gleam of a million million of suns?" What is it all, forsooth, if at last we end,

"Swallowed in Vastness, lost in Silence, drown'd
in the deeps of a meaningless Past"?

As was natural, the sequel to "Locksley Hall" was received with more than curiosity — with a certain philosophical interest. I do not see that it is out of temper with that fervid chant which, forty-five years before, seized upon all young hearts and caught the ear of the world. Here is the same protest against conditions: in youth, a revolt from convention and class-tyranny; in age, a protest against lawlessness and irreverence. The poet now as then resists the main grievance — but with an old man's increased petulance of speech. His after-song does not wreak itself upon the master passions of love and ambition, and hence fastens less strongly on the thoughts of the young; nor does it come with the unused rhythm, the fresh and novel cadence, that stamped the now hackneyed measure with a lyric's name. Yet, as to its art and imagery, the same effects are there, differing only in a more vigorous method, an intentional roughness, from the individual early verse. The new burthen is termed pessimistic, but, for all its impatient summary of ills, it ends with a cry of faith. And so ends "Vastness":

"I know, let it be! for I loved him, and love
him forever: The dead are not dead but alive."

If Browning is more intelligibly an optimist, it is because he studies mankind from a scientific point of view, keeping his own temper and spirits withal. He has a more abiding and "saving faith" in the immanence of a beneficent ruling power. Both these poets have deepened and widened their outlook: the one listens to the roll of the ages, and marks the

courses of the stars; the other pierces the soul, to find the secret of a universe in the microcosm, man. Tennyson is the more impressed by that science which observes the astronomic and cosmic whole of nature, while biology and psychology are anticipated by Browning and subjected to his usufruct.

When the laureate was raised to the peerage — a station which he twice declined in middle life — he gained some attention from the satirists, and his acceptance of rank no doubt was honestly bemoaned by many sturdy radicals. It is difficult, nevertheless, to find any violation of principle or taste in the receipt by England's favorite and official poet of such an honor, bestowed at the climax of his years and fame. Republicans should bear in mind that the republic of letters is the only one to which Alfred Tennyson owed allegiance; that he was the "first citizen" of an ancient monarchy which honored letters by gratefully conferring upon him its high traditional award. It would be truckling for an American, loyal to his own form of government, to receive an aristocratic title from some foreign potentate. Longfellow, for example, promptly declined an order tendered him by the King of Italy. But a sense of fitness, and even patriotism, should make it easy for an Englishman, faithful to a constitutional monarchy, to accept any well-earned dignity under that system. In every country it is thought worth while for one to be the founder of his family; and in Great Britain no able man could do more for descendants, to whom he is not sure of bequeathing his talents, than by handing down a class-privilege, even though it confers no additional glory upon the original winner. Extreme British democrats, who openly or covertly wish to change the form of government, and even communists, are aware that Tennyson does not belong to their ranks. He has been, as I long since wrote, a liberal conservative: liberal in humanity and progressive thought, strictly conservative in allegiance to the national system. As for that, touch but the territory, imperil the institutions, of Great Britain, and Swinburne himself — the pupil of Landor, Mazzini, and Hugo — betrays the blood in his veins. Tennyson, a liberal of the Maurice group, has been cleverly styled by Whitman a "poet of feudalism"; he is a celebrator of the past, of sovereignty and knighthood; he is no lost leader, "just for a ribbon" leaving some gallant cause forsworn or any song unsung. In all fairness, his acceptance of rank savors less of inconsistency than does the logic of those who rail at the world for neglect of genius, and then upbraid them both for coming to an understanding.

As a final word about Lord Tennyson, a laureate of thirty-seven years' service, it may

be said that no predecessor has filled his office with fewer lapses from the quality of a poet. Southey's patriotic rubbish was no better, and not much worse, than his verse at large. Wordsworth, during the few years of his incumbency, wrote little official verse. Tennyson has freshened the greenness of the laurel; a vivid series of national odes and ballads is the result of his journey as its wearer. That some of his perfunctory salutations and pæans have been failures, notably the Jubilee ode of the current year, is evidence that genius does not always obey orders. The Wellington ode, "The Charge of the Light Brigade," the dedications of "In Memoriam" and the "Idylls," and such noble ballads as those of "Grenville," "The Revenge," "Lucknow"—these are his vouchers for the wreath, and, whether inspired by it or not, are henceforth a secure portion of his country's song.

BROWNING.

OLD lovers of Tennyson feel that he is best understood by those who grew up with his poems, and profited by his advance to the mature art and power of "In Memoriam" and the four chief "Idylls." Browning began and continued in quite another way. A neophyte might as well get hold of his middle-life work, and thence read backward and forward. If one prefers to gain an introduction to the author of "The Inn Album" from a sustained poem, rather than from his lyrics, nothing better could be chosen than that nervous, coherent work, the first in date of his productions during the time we are considering. I recall its effect upon one or two of my younger friends, who ascribe to it their first sense of those profound emotions which set the spirit free. Seldom is there a work more inwrought with characterization, fateful gathering, intense human passion, tragic action to which the realistic scene and manners serve as heightening foils, than this thrilling epic of men and women whose destinies are compressed within a single day. The tragedy ends with the death of two sinners, whose souls are first laid bare. No one of Browning's works is better proportioned, or less sophisticated in diction,—the latter, in truth, being never suffered to divert attention from the movement and interest of this electric novel in verse. It was quickly followed by a various little book, "Pacchiorotto." The poet now turns upon his critics, with countering satire and a defense of his hardy methods; but he welcomes, in title-piece and epilogue, "friends who are sound" to his Thirty-Four Port, promising "nettle-broth" galore to the feeble and maudlin. Of the shorter efforts, "A Forgiveness" displays to the full his dramatic and psychological mastery.

Its verse is modeled with the strong right hand that painted "My Last Duchess," to which it is in all respects a vigorous companion-piece.

A third translation from the Greek drama, the "Agamemnon" of Æschylus, is marked by fidelity to the text, gained through a free disregard of English idiom, but scarcely has the sweetness and grace of "Balaustion" and "Aristophanes' Apology."

The volume entitled "La Saisiaz: The Two Poets of Croisic," like "The Inn Album," commends itself to lay readers, being direct and forcible, with abundant food for thought. The opening poem, in the "Locksley Hall" measure, bravely considers the problem of mortal and immortal life. Its successor reeks with humorous wisdom, irony, knowledge of the world. An ideal lyric supplements them, inscribed to the woman whose aid to the writer's song is symbolized by the cricket's note that helped out a minstrel's tune when his lyre had broken a string. But the finest and richest display of Browning's triune lyrical, narrative, and analytical vigor, which he has given us since the memorable "Dramatic Lyrics" and "Men and Women," is found in the series (1879-80) of "Dramatic Idylls." These silence the critic's complaint of the neglect or dilution of the poet's original genius. The most impressive of the metrical tales are "Martin Ralph," "Clive"—a marvelous evocation—and "Ned Bratts"—a Holbeinish conjecture of the effect on a dull brutish hind of Bunyan's teachings. "Pheidippides," a figure of the Athenian runner with news from Marathon, is superb, and "Doctor ——" quite unapproachable for jest and satire. The story of "Muyléykeh" and his Arab steed is already a classic. Always throughout these vivid impersonations, as in "Ivan Ivanovitch" and "Pietro of Albano," the magician's supreme intent is to reveal

"What's under lock and key —
Man's soul!"

"Jocoseria" (1883), made up of brief and sturdy poems, illustrates again the author's habit of exploration through all literatures for his texts and themes. After the grim, pathetic ballad of "Donald" and the grimmer "Christina and Monaldeschi," we have in "Jochanan Hakkadosh" the vital lessons of the book. The Rabbi, and the pupils who find his sayings hard indeed, are no inapt types of our modern poet and his circle. As in "Paracelsus," Browning's favorite theorem continues to be the soul's real victory achieved in the apparent failures of earthly life. His latter years are given more and more to the consideration of eternal rather than temporal questions. Under the guise of a dervish he proffers, in "Ferishtah's Fancies," a sum of hopeful wis-

dom as to the meaning of existence, the goodness of the Creator. The thought, like all great thought, is simple, yet put so subtle-wise as to make it well that our latter-day Solomon has the fame that tempts a world to study the riddling homilies of his old age. To those who balk thereat no comfort is vouchsafed except such as they find in "Pambo" of the preceding volume,—for he still merrily "offends with his tongue," though clearly an interpreter of the purest theistic spirit of our time. My brief references to Browning's plentiful aftermath close with his "Parleyings with Certain People of Importance in Their Day." His intellect disports itself more than ever in these half-dozen citations of far-away personages whom he raises from the dead at will. The work is capricious enough, but he does not forget, in the most rugged and obscure passages, to give us interludes that prove his voice still unimpaired. "Gerard de Lareise" is smooth and delicate enough for a fastidious ear, with rare bits of song included, and music itself receives expert attention in "Charles Arison." The prologue and epilogue of this book are not its least essential matters. All in all, however, it is not so ultimate and satisfactory as one could desire. At whatever worth he may rate the clubs of quidnuncs associated to study him, he does not disdain to make riddles for them, as in the Prelude, and to choose remote, obscure topics for their discussion—somewhat as the wizard Michael Scott, compelled to supply tasks for his familiar, succeeded at last by ordering him to make ropes out of sea-sand. He is right in asking them no special clews, for that which, written in verse, can be conveyed as well by a paraphrase, certainly is not poetry.

Most of the foregoing work, so varied and affluent, is in rhymed verse. Great respect is paid to the observance of the rhyme, even though meaning and measure halt for it. Whitman's Hebraic chant, often vibrating with profound rhythmical harmony, is the outcome of a belief that rhymes are hackneyed and trivial; and as Browning's rhymes are not seldom forced and artificial to a degree reached by no other master, the question is asked why he should rhyme at all, why he does not confine himself to his typical blank-verse and other free-hand measures.

To this it might be replied that he was born a poet, with the English lyrical ear and accentual instinct; that he rhymes by nature, and exquisitely, as we see from all his simpler melodies, and that he is not the man to slight an intuitive note of expression. With all his headlong tyranny over restraints of form, an adherence to rhyme, as in the case of Swinburne, is "a brake upon his speech"; otherwise

his fluency, although the result of endlessly changeable thought, would quite outleap the effective limits of art. That the brakes creak and groan is a proof they are doing their work. But what of his involved and parenthetical style? A rule concerning language is that it has power to formulate not only problems of absolute geometry, but those of imaginative thought; and clearness of style has been a grace of the first poets and thinkers. When Browning's tangled syntax is involuntary, it may denote a struggling process of thought, for the style is the man. But, in defense of such of these "hard readings" as seem voluntary and of aforethought, we call to mind the oriental feeling that truth is most oracular when couched in emblems and deep phrases. Nature arms her sweetest kernels with a prickly and resistful exterior, so that they are procured by toil which gives them worth. This poet surrounds his treasures with labyrinths and thorn-hedges that stimulate the reader's onset. The habit is defensible when the treasures are so genuine. To experts and thinkers, who do not need a lure to make them value the quest, such things are an irritation and open to the disfavor shown by many who yield to none in respect for Browning's creative power.

BROWNING CLUBS.

YET it is plain that both the style and matter of his work, after years of self-respecting adherence to his own ways, have at last given occasion for the most royal warrant of fame and appreciation ever granted to poet or sage while still in the flesh. To be sure there never was a time when such a result could more reasonably be expected. Our period exceeds all others, even the Alexandrian, in literary bustle and research. What organized phalanxes for the study and annotation of our classics,—of course, and as is fitting, with the Shakspeare societies at their head! How rude the capture of Shelley, the avatar of our ideality and lyrical feeling! Old and young, even the "little hordes" of Fourier's socialistic dream, divide the ethereal raiment of the poet's poet, that each may bear away some shred of its gossamer. Shelley's lifelong and reverent lovers, who yield themselves silently to the imponderable, divine beauty of his numbers, and who would as soon make an autopsy of Lycidas himself as to approach his verse with hook and scalpel, look with equal wonder at the tribes which now claim their poet as if by right of discovery and the select few who burden his music with their notes and scholia. To its transformation into a "cult" they apply the stricture of a famous preacher who was concerned at the multiplication of

cheap Bibles. The evangelical bodies, he declared, by placing Holy Writ in every lobby and corridor, have dispelled the sacred awe in which it was held, and in fact have made it "as common as a pack of cards." Feeling, taste, instinct,—all are against making a text-book of Shelley's poetry, almost the last reliquary guarded, with some right of distant kinship, by those who claim a humble inheritance of song. The sudden uprising of many Browning clubs is the latest symptom of the rage for elucidation. The like of it has not been witnessed since the days of the neo-Platonists and grammarians; nor were there a thousand printing-presses at the command of the Alexandrian scholiasts. Not only more than one University quadrangle, but every mercantile town, from London, where the poet dwells, to the farthest outpost of the western continent, has its central Browning Society, from which dependents radiate like the little spiders that spin their tiny strands near the maternal web. Emerson was a seer; Browning is a virile poet and scholar; but it has been the same with the followers of both—a Browning student of the first order can do much for us,—while one of the third or fourth remove, whose degree is expressed algebraically as $B^{\frac{1}{n}}$ or $\sqrt[n]{B}$, may be and often is as prosaic a claimant to special illumination as one is apt to meet. The "study" of Browning takes strong hold upon theorists, analysts, didacticians, who care little for poetry in itself, and who, like Chinese artists, pay more respect to the facial dimensions of his Muse than to her essential beauty and the divine light of her eyes. The master himself may well view with distrust certain phases of a movement originating with his more-favored disciples; nor is poetry that requires annotation in its own time, surer, on that account, of supremacy in the future. Perhaps the best that can be said of this matter is that something out of the common is needed to direct attention to a great original genius, and to secure for a poet, after his long experience of neglect, some practical return for the fruits of his imagination.

A contrast between the objective, or classical, dramatic mode and that of Browning is not derogatory to the resources of either. In the former, the author's thinking is done outside of the work; the work itself, the product of thought, stands as a creation, with the details of its molding unexplained. The other exhibits the play of the constructor's thought. The result, as affecting the imagination, justifies the conventional aim—to make us see, as in real life, the outside of persons and events, concerning ourselves rather with actual speech and movement than with a search for hidden

influences, esoteric laws. To read one of Browning's psychical analyses is like consulting a watch that has a transparent glass, instead of a cap of gold, surmounting the interior. We forget the beauty and proportions of the jeweled time-piece, even its office as a chronicler of time, and are absorbed by the intricate and dexterous, rather than artistic, display of the works within. Here is movement, here is curious and exact machinery—here is the very soul of the thing, no doubt; but a watch of the kind that marks the time as if by some will and guerdon of its own is even more suggestive and often as satisfying to its possessor. All the more, Browning represents the introspective science of the new age. Regard one of his men or women: you detect not only the striking figure, the impassioned human speech and conduct, but as if from some electric coil so intense a light is shot beyond that every organ and integument are revealed. You see the blood in its secretest channels, the convolutions and gyrations of the molecular brain, all the mechanism that obeys the impulse of the resultant personage. Attention is diverted from the entire creation to the functions of its parts. Events become of import chiefly for the currents which promote them, or which they initiate. Browning's genius has made this under-world a tributary of its domain. As a mind-reader, then, he is the most dramatic of poets. The fact that, after scrutinizing his personages, he translates the thoughts of all into his own tongue, may lessen their objective value, but those wonted to the language find nothing better suited to their taste.

His judicial acceptance of things as they are is largely a matter of temperament, and does not imply that he is more devout and theistic, or a sounder optimist, than his chief compeer. The broadening effect of experience as a man of the world also has much to do with it. Both Tennyson and Browning are highly intellectual. The former's instinct for art and beauty is supreme, and mental analytics yield to them in his work. To Browning poetic effects, of which he has proved himself a master, often are nothing but impedimenta, to be discarded when fairly in pursuit of psychological discovery.

A conclusion with respect to Tennyson, in my review of his career from a much earlier point of time, was that he would be regarded long hereafter as, "all in all, the fullest representative" of the "refined and complex Victorian age." To this I added that he had carried his idyllic mode "to such perfection that its cycle seems already near an end" and "a new generation is calling for work of a different order, for more vital passion and dramatic force." After many years, he still seems

to me the exponent of the typical Victorian period—that in which the sentiment poetized in the “Idylls” and “In Memoriam” was at its height. It is equally true that Browning was in reserve as the leader-elect of the present succeeding time. The Queen is still on her throne, but her reign outlasts the schools to which her name belongs. New movements are initiated, and Browning is their interpreter so far as poetic insight is concerned. To this we only have to add that he is an eminent example of the justice of our exception to Taine’s dogma of the invariable subjection of an artist to his accidental conditions. He has proved that his genius is of the kind that creates its own environment and makes for itself a new atmosphere, whether of heaven or of earth.

SWINBURNE.

SWINBURNE also has been a leader, particularly on the side of form and expression, and through his brilliant command of effects which novices are just as sure to copy as young musicians are to adopt the “methods” of a Chopin or a Liszt. Obvious tendencies of the new school reveal the influence of Browning, modified structurally by Swinburne’s lyrical abandonment and feats of diction and rhythm.

As he reaches middle life, the volume of his productions becomes remarkable, putting to confusion those who doubted his vitality and staying-power. His second classical drama, “Erechtheus,” is severely antique in mold, with strong text and choruses. But it is relatively frigid, apart from common interest, and lacks something of the fire and melody of *Atalanta*. The author’s compulsive lyrical faculty, however, has not ceased its exercise—the resulting odes, songs, and manifold brief poems having been collected chiefly in the second series of “Poems and Ballads,” and in “*Studies in Song*,” “*Songs of the Springtides*,” “*A Century of Roundels*,” and “*A Midsummer Holiday*.” Their variety and splendor sustain the minstrel’s early promise:—any one of the collections would make a reputation. If they have been greeted with less than our old wonder and relish, it is due to the unforgettable novelty of those first impressions, and to the profusion of this poet’s exhaustless out-giving. Masterpieces of their kind among the new songs and ballads are the “*Ave atque Vale*,” of which I wrote in a former essay, and “*A Forsaken Garden*.” The translations from Villon charm the ear with a witching sense possibly unfelt by the vagabond balladist’s contemporaries. Swinburne is still at the head of British elegiac and memorial poets. Witness the twin odes in honor of Landor and Hugo, covering the entire progress of their

achievements, and the second ode to Hugo, the lines to Mazzini, and other compositions in the highest mood of tributary song. A pervasive element of these books is that relating to the sea, of which their author is a familiar and votary. One of them (as also the poem “*By the North Sea*”) is inscribed to his “best friend, Theodore Watts,” the poet and critic to whom Mr. Swinburne is indebted for loyal companionship and devotion. The “*Songs of the Springtides*” are surcharged with endless harmony of ocean winds and surges. “*Thalassius*,” “*On the Cliffs*,” “*The Garden of Cymodoce*,” full of alliterative and billowy cadence, are fashioned in a classical and nobly swelling mold. The unique poem of Sappho, “*On the Cliffs*,” was suggested by the fancy that the nightingales still repeat fragments of her Lesbian song. “*A Midsummer Holiday*” takes us again by the sea and through the ‘long-shore lanes of England; its refrain—“Our father Chaucer, here we praise thy name”—recalls the enduring freshness of a poet to whom still the avowal can be made that—

“Each year that England clothes herself with May
She takes thy likeness on her.”

Elaborate and refined as all these pieces are, they exhale a purely English atmosphere. “*A Century of Roundels*” is the most simple and distinctive of the lyrical collections. Among the noteworthy roundels are several discoursing with Death, and those on Autumn and Winter; best of all, the clear-cut series on “*A Baby’s Death*.” In the latter, as in the cradle-songs and other notes of infancy and childhood, he is winning and tender—in all his poems on age, reverent and eulogistic. The artistic motive of his political outbursts, at various crises, is quite subordinate to their writer’s impulsive views; their satire and invective possibly act as safety-valves and are of interest to curious students of the poetic temperament in its extremes.

Not a few consider “*Tristram of Lyonesse*” to be his most attractive and ideal narrative poem. The conception of the Arthurian legend is distinct from that of either Tennyson or Arnold, and the verse is rich with desire, foreboding, and pathetic beauty. The opening phrase, *The Sailing of the Swallow*, is enchanting; the description of Iseult of Ireland is a wonder, and the whole coil of burning love and piteous mischance was never before so marvelously woven.

Of Swinburne’s recent dramas, “*Mary Stuart*” completes the most imposing Trilogy in modern literature, and is, while less romantic than “*Chastelard*” and less eloquent than “*Bothwell*,” a fit successor to the two. Its vigor is condensed and joined with a gravity becom-

ing the firm hand of maturer years as it depicts the culmination of this historic tragedy — the taking-off of a picturesque, impassioned, superbly selfish type of royalty and womanhood. The author's consistent ideal of Mary Stuart is formed by intuition and critical study, and is reasonably set forth in his prose essay. The future will accept his conception as justly interpreting the secret of her career. In the *Trilogy* her fate, through the agency of Mary Beaton, is made the predestined outcome of early and heartless misdeeds, and dramatically ends the steady process of the work.

"*Marino Faliero*," post-dating by sixty-five years Byron's drama of that name, following the same chronicle and with the same personages, is a direct challenge to comparison. Both are fairly representative of their authors. Neither is a stage-play: Byron's was tested against his own judgment, and he found no fault with the critics who thought his genius undramatic. There is no talk of love in either play, except the innocent passion which Swinburne creates between Bertuccio and the Duchess. Both poets make the Doge's part o'ertop all others, but Byron lightens Faliero's monologues with stage business, etc., and pays serious attention to the action of the piece. Swinburne uses the higher poetic strain throughout; his language is heroic, the verse and diction are always imposing, but proportion, background, and the question of relative values obtain too little of his attention. All know the slovenly and unstudied character of Byron's blank verse. Swinburne adheres to the type, equally finished and prodigal, to which he has wonted us. In every sense he is a better workman. But the directness and simplicity of Byron's drama are to be considered. The death-speech which he puts in Faliero's mouth, theatrical as it is, will continue memorable as a fine instance of Byronic power. In the modern play the Doge's speech extends to fifteen pages (with the chanting interludes), and this directly after a trial-scene in which he has done most of the talking. Half this rhythmical eloquence would be more impressive than the whole.

In spite of Swinburne's deprecation of Lord Byron, and his own more direct inheritance from Shelley, he has several of the former's traits: the scorn of dullness and commonplace, faith in his own conclusions, and the swift and bold mastery of a forcible theme. Continuing the habit of prose-writing, as is the custom of the times, he has displayed his scholarship and versatility in new critical essays. The value of some of these — such, for example, as the prose dithyrambic on Hugo — lies not so much in their judicial quality as in those felicitous critical epigrams which take the reader by their sudden insight and originality. "A Note

on Charlotte Brontë" is admirable in this way, for all its tendency to extremes. The volume of "*Miscellanies*" (1886) contains, on the whole, his soundest and most varied prose-writing, much of it as well considered as one could desire, and expressing, brilliantly of course, the judgment of a poetic scholar in his dispassionate mood. It is interesting to see how easily and royally Mr. Swinburne keeps up his domination over an active class of writers. His scholarship, indisputable talent, and Napoleonic method of judgment and warfare, render him a kind of autocrat whom few of his craft care to encounter openly, though specialists in matters of research and criticism occasionally venture on rebellion. Whatever ground he loses is lost in consequence of a law already pointed out, which operates in the case of a vein too rich and productive. The torrent of his rhythm, beautiful and imaginative as it is, satiates the public — even animals fed on too nutritious food will turn to bran and husks for a relief. And the workings of his genius, from its very force and individuality, are such as he cannot be expected to vary or suspend.

DEATH has summoned with his impartial touch both young and old alike from the cycle of poets considered in our original review. What more I wish to say concerning Rossetti, Horne, Wells, O'Shaughnessy, Marston, Collins, and others who have joined the silent majority, must be said elsewhere. Nor does the space assigned me here permit an extension of former remarks upon Arnold, W. Morris, Miss Rossetti, Payne, Buchanan, and other old acquaintances, — some of whom, such as Bell Scott, Noel, Patmore, and George Meredith, have materially changed or enriched their respective notes. Many authors not hereinbefore reviewed come properly within our annals of the last twelve years; dramatists like Merivale, Gilbert, Ross Neil; colonial and provincial poets, upon whose list are Gordon, Sladen, Sharp, Anderson, Toru Dutt, Roberts, etc.; song-makers and London lyrists, among whom are Aidé, Ashby-Sterry, Clement Scott; not to forget a satirist like Court-hope, and translators — a class whose service in England is never at an end. But the remainder of the present article must be devoted to remarks on the latter-day poets not embraced in the foregoing classification, and to discussion of tendencies manifest in the spirit of recent British song.

SYMONDS — EDWIN ARNOLD — AUSTIN —
LEWIS MORRIS, ETC.

OF the poets whose books have appeared mainly since the date of our earlier review,

several are conspicuous for the extent of their work, and demand attention in any notice of the time. What are their respective claims to the favor awarded leaders whom they rival in productiveness?

Symonds is fairly typical of the best results of the English university training. He is an exemplar of taste; thus, and liberal culture, joined with fine perceptive faculties, endow a writer who has the respect of lovers of the beautiful for his service as a guide to its history and masterpieces. A wealth of language and material sustains his prose explorations in the renaissance, his Grecian and Italian sketches, his charming discourse of the Greek poets and of the Italian and other literatures. He has given us complete and almost ideal translations of the sonnets of Angelo and Campanella. Coming to his original verse, we again see what taste and sympathy can do for a receptive nature; all, in fact, that they can do towards the making of a poet born, not with genius, but with a facile and persistent bent for art. The division between friendship and love is no more absolute, as not of degree but of kind, than that between the connoisseur and the most careless but impassioned poet. Symonds recognizes this in a thoroughbred preface to "Many Moods," a book covering the verses of fifteen years. He proffers attractive work, good handling of the slow meters, and an Italian modification of the antique feeling. There is some lyrical quality in his "Spring Songs." Almost the same remarks apply to a later volume, "New and Old." Its atmosphere, landscape, and notes of sympathy therewith are so un-English that one must possess the author's Latinesque training to feel them adequately. We have sequences of polished sonnets in the "Animi Figura" and its interpreter, "Vagabundi Libellus." These studies of a "beauty-loving and impulsive, but at the same time self-tormenting and conscientious mind" are his most satisfactory efforts in verse; but if their emotions are, as he avows, "imagined," he reasons too curiously for a poet. "Stella" has a right to complain of his hero, and it is no wonder she went mad. His poems are suggestive to careful students only, in spite of their exquisite word-painting, and the merit of sonnets like those on "The Thought of Death." Admiring the finish of them all, we try in vain to recall the one abiding piece or stanza. Here is scholar's work of the first order, the outcome of knowledge and a sense of beauty. Perhaps the author would have succeeded as well as a painter, sculptor, or architect, for in any direction taste would be his mainstay. Nothing can be happier than his rendering, with comments, of the medieval Latin Student's Songs,

neatly entitled "Wine, Woman, and Song"; and in the prose "Italian By-ways" his critical touch is so light and rare that we are thankful for his companionship.

Those who wish to make more than a ripple on the stream may profit by the example of Edwin Arnold. During the latest quarter of a busy life he has gained a respectful hearing in his own country and something like fame in America. He is not a creative poet, yet the success of his Asiatic legends is due to more than an attractive dressing-up of the commonplace. He has zest, learning, industry, and an instinct for color and picturesqueness strengthened through absorption of the Oriental poetry, by turns fanciful and sublime. Above all, he shows the advantage of new ground, or of ground newly surveyed, and an interest in his subject which is contagious. There is a man behind his cantos, and a man clever enough to move in the latest direction of our unsettled taste and thought. A distinct theme and motive, skillfully followed, are the next best things to inventive power. The "Light of Asia" was not an ordinary production. With "The Indian Song of Songs," and "Pearls of the Faith" it formed a triune exposition, on the poetic side, of the Hindoo and Arabian theologies. Probably Arnold's ideals of Buddhism, even of Islamism, insensibly spring from a western conception, but he conveys them with sensuous warmth and much artistic skill. In these books and the translations from the Mahâbhârata, he works an old vein in a new way. Both the accuracy and ethics of his Oriental pieces have been lauded and attacked with equal vehemence. They have received great attention in that part of the United States where discussion is most "advanced" and speculative, and where Buddhism and theosophy are just now indiscriminately a fashion, and likely to pass away as have many fashions that led up to them. Arnold's longer works may soon be laid aside, but such a lyric as "After Death in Arabia," whether original or a paraphrase, will be treasured for its genuine beauty and serene pledges to human faith and hope.

Alfred Austin's essays on "The Poetry of the Period" justly attracted notice. They were epigrammatic, conceived in a logical if disciplinary spirit, and almost the first severe criticism to which our "chief musicians" have been subjected. Here was one who dared to lay his hand on the sacred images. He bore down mercilessly upon "the feminine, narrow, domesticated, timorous" verse of the day, calling Tennyson feminine, Browning studious, Whitman noisy and chaotic, Swinburne and Morris not great because the times are bad, and only less tedious than the rest. While an

iconoclast, his effort was constructive in its demand for the movement and passion that have animated more virile eras. When so lusty a critic himself came out as a poet, it fairly might have been expected that he would at least, whatever his demerits, avoid the tameness thus deplored. But movement and the divine fire are precisely what are lacking in Mr. Austin's respectable and somewhat labored books of verse. "The Human Tragedy," a work by which he doubtless would wish to be judged, includes an early-printed section, "Madonna's Child," which is a key to the poem. The whole requires ten thousand lines, cast in *ottava rima* and other standard forms. The Georgian measures are here, but not their force and glow. The movement is of the slowest, the philosophy prudish, and the story hard to follow: lovers are kept from marriage by religious zeal; they don the Red Cross, travel and talk interminably, and finally are shot, and die in each other's arms to the great comfort of the reader. "Savonarola" is a better work,—a studious tragedy, but not relieved by humor and realism, and with few touches that are imaginative. The title-piece of "At the Gate of the Convent" is artistic and interesting, and is followed by a good deal of contemplative verse, mostly lyrical in form, with the lofty ode not slighted. What we miss is the incense of divine poesy. The author's satirical interludes have point, and I have seen graceful lyrics from his pen, but his ambitious verse, on whatever principle composed, is not of the class that reaches the popular heart, nor likely, on the other hand, to capture a select group of votaries like those so loyal from the outset to Rossetti and Browning.

In every generation there is some maker of books who, without being a great writer, figures as such in his own and other minds. His thorough belief in his function and his hold upon a faithful constituency are things which men of better parts may not envy him, yet find beyond their reach. Lewis Morris with his "Epic of Hades," "Gwen," "Songs of Two Worlds," and other works of many editions, seems to be a writer whose fluent verse satisfies the popular need for rhythmical diet. Certain observances usually are noted in poetry of this kind. Its author handles a pretentious theme, and at much length, thus giving his effort an air of importance. He falls into the manner of popular models, and with great facility. He has a story to tell, or some lesson to teach, in all cases trite enough to an expert but more impressive to the multitude than the expert suspects. Finally, he has zeal and measureless industry, and takes himself more seriously than if he were a sensitive and less robust personage. It would be wrong

to say that Mr. Morris's verse is no better than that of Pollok, Tupper, and Bickersteth. But he bears to this, the most refined of periods, pretty much the same relation which they bore respectively to their own. "The Epic of Hades" is written in diluted Tennysonian verse, its merit lying in simplicity and avoidance of affectations. It is, however, only a metrical restatement of the Greek mythology according to Lempriere, and without that magic transmutation which alone justifies a resmelting of the antique. "Gwen" is a drama in monologue—an English love-story and, as far as "Maud" is dramatic, an attenuated Maud, without novelty of form or incident. In few of Morris's poems is there the radiant spirit which floods a word, a line, a passage, with essential meaning. In "The Ode of Life" he girds himself for a Pindaric effort, and strives with much grandiloquence to display the entire panorama of existence. His truest poetry, though neither he nor his admirers may so regard it, is found among the "Songs of Two Worlds" and "Songs Unsung," and chiefly in simple pieces like "The Organ Boy." A longer poem, "Clytemnestra in Paris," should be mentioned for its originality and interest; it is based on the trial reports of a recent murder, and shows the worth of a vivid subject and a conception due solely to the poet. Morris also is forcible, though prolix, in some of his speculative theses, but leaves an impression of infallibility and that there are few subjects he would hesitate to preempt.

A survey of these energetic writers leads to the inference that the more ambitious recent efforts do not acquaint us with the new poets who possess the greatest delicacy of hand and vision, and are subject to the most spiritual moods. The successive books of Walter Smith, author of "Olig Grange," "Hilda," "Kildrostan," etc., only strengthen this inference. Their vogue with a class is due to the fact that, like Mrs. ("Violet Fane") Singleton's very feminine poem of "Denzil Place," each is what she honestly calls the latter—a story in verse. They are metrical novelettes, with the excess of interest and liveliness in favor of the lady, who gives zest to her romance by a warmth of realism, upon which the Scotch idyllist would doubtless blush to venture. Dr. Smith's "North Country Folk" contains some good short pieces. Mrs. Singleton's "Queen of the Fairies" is a tender story, purely and simply told. Her drama, "Anthony Babington," is very creditable, above the common range of woman's work, which scarcely can be said of her miscellaneous lyrics. Her love-poetry is of all grades, and not always in the best taste. Mrs. Pfeiffer has been an untiring producer

of verse of a different cast. Her early "Poems" embraced, besides a good ode "To the Teuton Woman," one or two striking ballads which indicated her natural bent, since developed in "The Fight at Rorke's Drift," and other spirited pieces. "Under the Aspens" is perhaps her most enjoyable collection. Her sonnets are thoughtful and intelligible, in this wise differing from the work of many sonnet-mongers, and those on Shelley and George Eliot are well worth preservation. In her more arduous flights she often fails, but there is an air of refinement and sincerity in much that comes from her pen.

Mrs. Hamilton King's long poem, "The Disciples," has been widely read. Four disciples of Marconi narrate, chiefly in blank verse and rhymed heroics, the story of Garibaldi. The influence of the two Brownings is visible in Mrs. King's style. Her chief poem, the story of Fra Ugo Bassi, though too long, has strong passages and effective pictures of Italian and Sicilian scenery. Her defects are a lack of condensed vigor and imagination.

ARTHUR J. MUNBY — JAMES THOMSON.

THERE are one or two marked exceptions to the inference just now drawn. When Mr. Munby's "Dorothy" appeared, sound-minded readers had a sense of refreshment. It was a novel pleasure to light upon a complete and wholesome poem, faithfully and winningly going at its purpose, that of depicting pastoral English scenes and extolling health and strength as elements of beauty in woman. The heroine of this unique "country story in elegiac verse" is genuine as one of Millet's peasant-girls or Winslow Homer's fisher-maidens. Seldom, nowadays, do we find such pictures of farm-life, bucolic work and sports, outside of Hardy's and Blackmore's novels. The plowing-scene is a subject for a painter, and he could find, indeed, a score of charming themes in this one poem. Dorothy's sweet face and noble bearing require, it is true, the device of an aristocratic fatherhood, and there is possibly an implication of the benefits of cross-breeding. Munby equals Millet in honest candor, but I think he goes beyond nature in the one blemish of his idyll; there is an over-coarseness in giving even a plow-girl hands that would disgust a navy or policeman. As might be expected of the poet who wrote "Doris," that lovely pastoral, he is an artist, and has achieved a difficult feat in popularizing his elegiac distichs.

A second exception is that of a man to whom a long chapter might be devoted, and whose life and writings, I doubt not, will be subjects of recurring interest during years to come.

For it may almost be said of the late James Thomson, author of "The City of Dreadful Night," that he was the English Poe. Not only in his command of measures, his weird imaginings, intellectual power and gloom, but with respect to his errant yet earnest temper, his isolation, and divergence from the ways of society as now constituted,—and very strangely also in the successive chances of his life so poor and proud, in his final decline through unfortunate habits and infirmities, even to the sad coincidence of his death in a hospital,—do the man, his genius, and career afford an almost startling parallel to what we know of our poet of "the grotesque and arabesque." Shelley, Heine, Leopardi, Schopenhauer,—such were the writers whom Thomson valued most, and whose influence is visible in his poetry. Yet the production already mentioned, and many others, have traits which are not found elsewhere in prose or verse. So much might be said of Thomson's work that I scarcely ought to touch upon it here. But "The City of Dreadful Night" may be characterized as a somber, darkly wrought composition, toned to a minor key from which it never varies. It is a mystical allegory, the outgrowth of broodings on hopelessness and spiritual desolation. The legend of Dürer's Melancholia is marvelously transcribed, and the isometric interlude, "As I came through the Desert thus it was," is only surpassed by Browning's "Childe Roland." The cup of pessimism, with all its conjuring bitterness, is drunk to the dregs in this enshrouded, and again lurid, but always remarkable poem. We have Omar Khayyám's bewilderment, without his epicurean compensations. "Vane's Story," the title-piece of an earlier volume, is similarly impressive, and minor lyrics are worth study for their intenseness and frequent strange beauty. "Vane's Story," though melodramatic, and curiously outspoken in its notion of life and death, its opposition to ordinary views, is not easily forgotten. On the side of artistic poetry we have the Arabic love-tale of "Weddah," and "Two Lovers"—a beautiful legend in quatrains. No one can read these, or the passionate "Mater Tenebrarum," or such a rhapsody as "He heard Her Sing," surcharged with melody and fire, without feeling that here was a true and foreordained poet. More profuse than Poe, less careful of his art, often purposely and effectively coarse, he holds a place of his own. He was a natural come-outer, and declared for all sorts and conditions of men, independently of rank or record. At times he proved, by such verses as "Sunday at Hampstead" and "Sunday on the River," that a blither nature underlay his gloom, and that happy experiences would

have made his song less pessimistic. But if ever a poet learned in suffering, it was he, and if the cup had passed from him we should have lost some powerful and distinctive verses. The posthumous volume, "*A Voice from the Nile*," contains, with a friendly memoir by Bertram Dobell, the fugitive productions of Thomson's early and later years.

VARIOUS RECENT POETS, AND THEIR TENDENCIES.

THE poetry of many recent and younger writers is still to be considered. They scarcely can be said to initiate a new school, or to divide themselves into groups like those formed by the minor poets of a slightly earlier time. Listening to various masters, and feeling the absence just now of any special tone or drift, more than one new aspirant essays some note of his own. Their very lack of assumption, and failure to claim by bold efforts a share of the attention secured by the novelists, imply a tacit acknowledgment that poetry cannot maintain at the moment its former dominance in the English world of letters. This is an unpromising attitude; but if they do not exhibit the ardent, full-throated confidence that begets leadership, there still are not a few who devote themselves to ideal beauty, and sing, in spite of discouragements, because the song is in them. They bear in one respect a mutual likeness. Though not given to the technical freaks of the recent art-extremists, the work of all displays a finish unknown at the outset of the Victorian period. The art of dexterous verse-making is so established that the neophyte has it at command. As with the technics of modern instrumental music, it is within common reach and not a subject for much remark.

Gosse, whom the public first knew as a poet, and who has become prominent as a literary scholar and critic, has not suffered general authorship to hinder his more ideal efforts for any length of time. That he is an attractive and competent master of English prose the leading journals and magazines bear constant witness, no less than his "*Studies in Northern Literature*," his "*Life of Gray*," lectures on poetry, and other essays, biographies, and contributions to works that are richer for his aid. All this prose matter has been refined and bettered by his poetic sensibility. And as a poet, the title of the first book for which he was sole sponsor, "*On Viol and Flute*," hints of his early quality. Though plainly alive to the renaissance movement, it was full of young blood and tuneful impulse; its contents appertaining to music, art, love, and the Norse legendary so familiar to him. His "*New Poems*," six years later in date, are simpler, more restrained

and meditative. They are deftly finished, pure and cool, a degree too cool for current taste. His classical sonnets — from the first he has been a good sonneteer — exhibit all these traits. He has a strong and logical sense of form, while his color is keyed to the tranquil and secondary, rather than the sensuous primitive, tones. A grace in which he has few equals is the fidelity to nature of his pastorals and lyrics. There is true and sweet landscape, the very spirit of the English coppices, rivers, and moors, in his quiet pieces. Successful with the French forms which he did much to introduce, he uses them sparingly; in fact, he seldom or never plays the tricks of the extreme decorationists, but trusts to the force of his thoughts and impressions. The contents of the volume, "*Firdausi in Exile*," may be taken, I suppose, as his most mature and varied work, for the early drama of "*King Erik*," though creditably done and on a theme quite native to him, does not show his bent to be strongly dramatic. Reviewing his verse, one finds a genuine feeling for nature, and subtle ideality, in "*Sunshine before Sunrise*," "*The Whitethroat*," "*Lying in the Grass*," "*The Shepherd of the Thames*," "*Obermann Yet Again*." His "*Theocritus*" has delicious melody and charm. There is a return in his longer poems, "*Firdausi*" and "*The Island of the Blest*," to the Italian method of Hunt and Keats. Gosse is an example of the latter-day poet who does so well and learnedly in prose as scarcely to obtain full credit for his natural poetic gift. His verse, like that of Arnold, with whom its spirit is allied, grows on one by quiet study. It is not often of a swift and lyrical character; yet that he can be both resonant and picturesque is evident from a vigorous ballad, "*The Cruise of the Rover*," which will bear reading with the sea-ballads of Tennyson and Kingsley, and of itself bestows upon its author the name of poet.

Blunt's "*Love Sonnets of Proteus*" are interesting as the artistic and sole utterance of their composer — the record, whether personal or not, of a man's successive love-experiences. This series of sonnets comes from one guided by the foremost English master, yet they are idiosyncratic and do not betray a weak or inexpert hand. Their savor of artificiality disappears when the writer ceases to be introspective, as in the fresh and wholesome sonnet on Gibraltar at the close. A claim to regard was at once established by "*Michael Field*," through her first volume, embracing the dramas of "*Callirhoë*" and "*Fair Rosamond*." It seemed a reoccupation of Swinburne's early ground, but this was only true with respect to the choice of themes. "*Callirhoë*" is classical merely in subject and time,

and is treated in a modern way, the characters being living men and women with a language compact of beauty and imagination. "Fair Rosamond" is brief, strong; the culminating act of a tragic scheme that has beguiled great artists to its handling. The dramas in this writer's second book, "The Father's Tragedy, etc.," reveal the same vigorous touch, but are diffuse and lack contrasting lights and shades; there is no humor.—speech and action are always at concert-pitch. Their diction, however, is more original than that of any other young writer. Often an epithet carries force, and is used in an entirely fresh way. This dramatist lacks proportion; her manner betokens close study of the Elizabethans, but of the minor ones rather than the greatest. Her work is notable for its freedom, even audacity, and contrasts in all respects with that of Tennyson—so correct of style and proportion, yet without natural dramatic fire. Her advance in "Brutus Ultor" is not of the right kind. It seems as if she hunted history for plots and themes. This is a Roman tragedy, compressed and over-virile—even coarse at times, as if the effort to speak as a man were a forced one. "Michael Field" is ambitious, and has warrant for it. Her motto should be "strength and beauty," and not strength alone. The "Nero" of Robert Bridges, an historical tragedy of the emperor's early reign, with narrower extremes of passion, is to my mind a more essentially virile work. There is a nobler severity in dialogue, which merits the name of Roman. The diction and blank verse are restrained, but impressive. The characters of Nero, Poppæa, Seneca, Agrippina, are distinctly drawn. While in a sense conventional, "Nero" shows the mark of a self-poised, confident hand. A few of the lyrics in Bridges' eclectic and privately printed volume of 1884 strengthen my opinion that he is a very real and artistic poet. The elegy "I have loved flowers that fade" is matchless in its way, apparently old in feeling yet perfectly original; and some of his songs rival it in their brief melody.

Canon Dixon's early work betrayed the close affinity between the new ecclesiasticism and the methods of Rossetti. His "Odes and Eclogues," on the other hand, are the most extreme type of Anglo-classic verse,—that peculiar grafting of modern thought upon the Grecian stock in which Arnold was a leading exponent, and which is so fascinating to a scholar-poet. His latest lyrics have a peculiar wandering beauty. All his work is finished to a notable degree. Dixon and Bridges at this distance appear to be the chief lights of a quaintly esoteric Oxford School.

Miss Robinson's verse is a delicate spray,

engendered by influences which began with Ruskin and the pre-Raphaelites, and in the end supplied the motive of British taste in plastic and decorative art, in letters, and in all the refinements of social life. She shows the effect of culture upon an impressible feminine nature, placed among devotees of the beautiful, and breathing its atmosphere from her childhood. Her classical studies were like those of Mrs. Browning, with an æsthetic training superadded that was not obtainable in Mrs. Browning's time. Her first little book, "A Handful of Honeysuckle," bears the obvious impress of Rossetti,—a shoot from his garden, but with new and fragrant blossoms of its own. The lyrics appended to her next work—a praiseworthy translation of "The Crowned Hippolytus"—were of a maturer cast. Afterward, applying her gift to humane transcripts of real life, she wrote "The New Arcadia," a group of ballads in behalf of suffering womanhood and England's poor. Doubtless this was too grave an experimental task, for in turning at last to Italy, and its *rispetti* and *stornelli*, she seems thoroughly at home. Her book of songs, "An Italian Garden," is the most essentially poetic of her works thus far. It breathes the Anglo-Italian spirit which is in fact her own. The *rispetti* forming her wreath of Tuscan cypress, with their beauty and sadness, are in every way characteristic of this poet, and in her most suggestive vein. Meanwhile her acquirements enable her to take an active part in the critical and biographical industries which the inevitable book-purveyor now opens for every rising author. Of her sister poets not yet mentioned, Mrs. Liddell and Miss Nesbit deserve notice. The former's "Songs in Minor Keys" are suffused with deep religious feeling, always expressed in good taste. Miss Nesbit's "Lays and Legends" suggest immature but promising individuality. She is capable of strong emotion which is most effective in her shorter lays.

Theodore Watts, the scholarly critic of poetry and romantic art, and a frequent contributor of verse to the literary journals, has thus far made no collection of his poems, except for private circulation. My knowledge of them is confined to some very perfect sonnets—a form of verse in which he is a natural and acknowledged master—and to a few lyrics of an elevated type. His ode to a Caged Petrel shows a large and eloquent method and a vivid perception of Nature's grander aspects. He apparently seeks to revive the broad feeling of the Georgian leaders; at all events, his touch is quite independent of any bias derived from the eminent poets with whom his life has been closely associated. Among the many writers of good

sonnets I may mention Hall Caine—Rossetti's young friend and memorialist. Dowden, whose critical work is always of a high order, has published a volume of poems, from which two or three imaginative examples of the same class have met my eye.

William Watson, judging from "The Prince's Quest," is a disciple of Morris and a good one—a poet of slow movement, from whom we have also careful sonnets and Landorian quatrains. Lee-Hamilton's varied "Poems and Transcripts," with the studies in "Apollo and Marsyas," remind one of the sculptor-poet Story by their reflection of Browning's manner; yet where he is Browningsque or Rossettian it is usually because the subject cannot be so well treated in another way. He has a taste for the psychologically dramatic, and usually interests the reader. "The Bride of Porphyry" and "The Wonder of the World" are far from commonplace, and his sonnets are exceptionally fine. W. J. Dawson is quite possessed by Rossetti, but has resources of fancy, rhythm, decoration. If he contrives to outgrow his pupilage, something of worth may be expected from him. There is much simplicity and grace in the "Poems" of Ernest Myers, largely suggested by study and travel, and they belong to the composite art school.

Many of the young writers devote themselves to cabinet-picturemaking, whether their dainty verse is properly idyllic or dramatic. The scenic tendency increases, just as it has grown, with an Irving to foster it, upon the stage. New poets strive, through affecting the mind's eye, to outdo the painter's appeal to the bodily vision. This invasion of a neighboring domain is a failure to utilize their own, and an undervaluation of the noblest of arts. Very pretty things of their kind, however, are often produced in this way.

A graceful scholar-poet is Lefroy, whose "Echoes" introduce us to old friends in a new guise. His open method is to compress into a single sonnet the tenor of some well-known poem. Gautier's "L'art," already paraphrased by Dobson, thus appears in sonnet-form, and many idylls of Theocritus are treated similarly. But these are supplemented by pleasing sonnets of English cloister and outdoor life. Raffalovich's "Cyril and Lionel" contains well-turned verse of a motive which, although it is not imitative, I find difficult to understand. By his name this writer would seem to be more justified than others in eking out his book with lyrics in other tongues than the English. Since the date of "Chastelard" this practice has been more or less affected by the new men. Swinburne put his French songs into a play where they rightly belong, as an

obligato to the action and discourse. Now every lutanist splits his tongue, like a parrot's, to sing strange words,—but there are capabilities still left in our native English. If such linguistic feats must be essayed, why not compose in the universal Volapük,—or more mellifluously in the late Mr. Pearl Andrews's "Alwato"?

A phase of the æsthetic crusade in defense of poetry as an utterance of the beautiful solely,—a movement having almost perfect development at its start with Keats so long ago,—has appeared in the outgivings of some of Ruskin's disciples, and avowedly in the verse of Oscar Wilde. His "Poems," with all their conceits, are the fruit of no mean talent. The opening group, under the head "Eleutheria," are the strongest. A lyric to England, "Ave Imperatrix," is manly verse,—a poetic and eloquent invocation. "The Garden of Eros," "Burden of Itys," "Charmides," are examples of the sensuous pseudo-classicism. There is a good deal of Keats, and something of Swinburne, in Wilde's pages, but his best master is Milton, whom he has studied, as did Keats, to good effect. His scholarship and cleverness are evident, as well as a native poetic gift. The latter indeed might prove his highest gift, if tended a little more seriously, and possibly he could be on better terms with himself in his heart of hearts, if he would forego his fancies, in behalf of his imagination—as there is still time for him to do. It is fair to accept the statement of his own ground, in his preface to the decorative verse of his friend Rennell Rodd,—though one doubts whether Gautier would not have dubbed the twain *jeunes brodeurs*, rather than *jeunes guerriers, du drapeau romantique*. The apostles of our Lord were filled, like them, with a "passionate ambition to go forth into far and fair lands with some message for the nations and some mission for the world." But not until many centuries had passed were their texts illuminated to the extent displayed by Mr. Rodd and his printer, with their resources of India-paper, apple-green tissue, vellum, and all the rarities desired by those who die of a rose in aromatic pain. Yet the verse of "Rose Leaf and Apple Leaf" is not so effeminate as one would suppose. The minstrel's green-sickness is now well over, judging from his "Feda and other Poems"; and in throwing it off he shows a good deal of the vigor needful for a decisive mark.

Now, as a minor but genuine example of poetic art, not alone for art's sake, but for dear nature's sake,—in the light of whose maternal smile all art must thrive and blossom if at all,—take "A Child's Garden of Verses" by Stevenson. This is a real addition to the

lore for children, and to that for man, to whom the child is father. The flowers of this little garden spring from the surplusage of a genius that creates nothing void of charm and originality. Thanks, then, for the fresh, pure touch, for the revelation of childhood with its vision of the lands of Nod and Counterpane, and of those next-door Foreign Lands spied from cherry-tree top, and beyond the trellised wall.

GARDE-JOYEUSE.

FINALLY we observe what has been, all in all, the most specific phase of British minstrelsy since 1875. This is seen in the profusion of lyrical elegantia, the varied grave and gay ditties, idylls, metrical cameos and intaglios, polished epistles and satires, classed as Society Verse, the Court Verse of older times. Perceiving signs of its revival, I could not foresee that it would flourish as it has, and really constitute the main thing upon which a lyrical interval would plume itself. Its popularity is curious and significant. The pioneer in verse of a movement already evident in society and household art was Austin Dobson. This favorite poet, by turns the Horace, Suckling, Prior, of his day, allying a debonair spirit with the learning and precision of Queen Anne's witty fabulists, has well advanced a career which began with "Vignettes in Rhyme." Enjoying the quality of that book, I felt that its poet, to hold his listeners, must change his song from time to time. Of this he has proved himself fully capable. His second volume, "Proverbs in Porcelain," gave us a series of little "proverbs" in dialogue, exquisite bits of "Louis Quinze," and perfectly unique in English verse. Nothing can excel the beauty and pathos of "Good-Night, Babette," with the Angelus song low-blended in its dying fall. The lines "To a Greek Girl," in the same collection, and the paraphrase of Gautier, "Ars Victrix," superadd a grace even beyond that of Dobson's early lyrics. Who has not read the "Idyll of the Carp," and the racy ballad of "Beau Brocade"? Here, too, are his little marvels in the shape of the rondel, rondeau, villanelle, triolet,—those French forms which he has handled with an ease almost inimitable, yet so wantonly provoking imitation.

Perhaps Dobson has more than others shaped the temper of our youngest poets, both English and American. A first selection from his works appeared in the United States in 1880, its welcome justifying a second in 1885. Meanwhile the choice *éditions de luxe*, "Old World Idylls," and "At the Sign of the Lyre," represent the greater portion of

his verse. Any author might point to such a record with pride; there is scarcely a stanza in these volumes wanting in extreme refinement, and this without marring its freshness and originality. In his place one should never yield—as there are stray omens that he sometimes is yielding—to any popular or journalistic temptation that would add a line to these fortunate pieces, except under the impulse of an artistic and spirited mood.

The influence of Dobson and his associates has been a characteristic—a symptomatic—expression of the interval between the close of the true Victorian period and the beginning of some new and, let us hope, inspiring poetic era. It has created, in fact, a sort of *école intermédiaire*, of which the gay and buoyant minstrelsy is doubtless preferable to those affected heroics that bore every one save the egotist who gives vent to them. For real poetry, though but a careless song, light as thistle-down and floating far from view, will find some lodgment for its seed even on distant shores and after long time. The roundels of Villon, of Du Bellay and his *Pléiade*, waited centuries for a fit English welcome and interpretation. Lang's "Ballads and Lyrics of old France," in 1872, captured the spirit of early French romantic song. Nine years afterward, his "Ballades in Blue China" chimed in with the temper of our new-fangled minstrel times. Such craftsmanship as the villanelle on Theocritus, the ballade to the same poet, and the ballades "Of Sleep" and "Of the Book-Hunter," came from a sympathetic hand. In the later "Ballades and Verses Vain" are new translations, etc., and a few striking addenda, memorably the resonant sonnet on the Odyssey. A "Ballade of his Choice of a Sepulchre" is Lang's highest mark as a lyricist, and perhaps the freest vein of his "Rhymes à la Mode" is in the long poems that do not fall under that designation, such as "The Fortunate Islands." He has almost preëmpted the "Ballade," but his later specimens of it are scarcely up to his own standard. "Cameos" and "Sonnetts from the Antique" are at the head of their class, and naturally, for no other Oxonian is at once so variously equipped a scholar and so much of a poet. The fidelity, diction, and style of his prose translations of Homer and Theocritus are equally distinguished. Thus far his most serious contribution to poetry is "Helen of Troy,"—a poem taking, as one would expect, the minority view of its legend, and depicting the fair cause of Troy's downfall as a victim to the plots of the gods. It is written felicitously in eight-line stanzas of a novel type, and, while not strong in special phrases and epithets, has much tranquil beauty. On his working-day

side, readers never wait long for something bright from this versatile, inventive feuilletonist,—a master of persiflage, whose learned humor and audacity, when he is most insular, are, perhaps, the most entertaining.

CONSIDERATIONS.

IF imitation be flattery, Dobson and Lang have breathed sufficient of its incense. Their “forms” have haunted a multitude of young singers, and proved as taking and infectious as the airs of Sullivan’s operettas. They have crossed the seas and multiplied in America more rapidly than the English sparrows which preceded them,—so that, as in the case of their feathered compatriots, the question is whether a check can be put to the breed. As I have said, this elegant rhyming, however light and delicate, is in fact a special feature of the latest Victorian literature, and, with its pretty notes tingling on the ear, is a text for some last words in discussion of what has gone before.

First, let me say that it is but shallow reasoning to worry over the outbreak of any fancy or fashion in art. Let a good thing—a much better thing than any form in verse—be overdone, and people will signify their weariness of it so decisively that the quickness of its exit will be as surprising as its temporary vogue.

What conclusions, then, are derivable from our summary of the British poetic movement of the last dozen years? We have paid tribute to the noble chants of a few masters who still teach us that Poetry is the child of the soul and the imagination. But one looks to the general drift of the younger poets, who initiate currents to the future, for an answer to the question,—What next? The direct influences of Keats, Wordsworth, and Shelley are no longer servilely displayed; few echo even Tennyson; Browning, Rossetti, and Swinburne are more widely favored; but ancestral and paternal strains are as much confused and blended in the verse of the newest aspirants as in genealogy. Their work is more composite than ever, judging from the poets selected as fairly representative. Only two of its divisions are sufficiently pronounced for even a fanciful classification. One is the Stained-Glass poetry, if I may so term it, that dates from the Blessed Damozel and cognate models by Rossetti and his group; the other, that Debonair Verse, whose composers apply themselves by turns to imitation of the French minstrelsy and forms, and to the æsthetic embroidery of Kensington-stitch rhyme,—for in each of these pleasant devices the same practitioners excel. Now the class first named, and the first division of the second, are of alien ori-

gin: they are exotics—their renaissance is of the chivalry, romance, mysticism, and balladry of foreign literatures. Only that witty, gallant verse which takes its cue from the courtly British models of the seventeenth and eighteenth centuries is an exception,—and that, whatever its cleverness and popularity, can hardly be termed inventive.

The next thing to be noted is the finical nicety to which, as we see, the technique of poetry has advanced. Never were there so many capable of polishing measures quite unexceptionable as to form and structure, never fewer whose efforts have lifted them above what is, to be sure, an unprecedented level—but still a level. The cult of beauty and art, delightfully revived so long ago by Hunt and Keats, has brought us at last to this. Concerning inspiration and the creative impulse, we have seen, first: that recent verse-makers who are most ambitious and prolific have not given much proof of exceptional genius. Their productions have the form and dimension of masterpieces, and little more. Secondly: those who appear to be real poets, shrinking from the effort to do great things in an uncongenial time, reveal their quality by lovely minor work—sometimes rising to an heroic and passionate but briefly uttered strain. And it is better to do small things well than to essay bolder ventures without heart or seriousness. Still, I think they must now and then doubt the importance of thus increasing, without specific increase of beauty and novelty, the mass of England’s rich anthology. Looking back, years from now, it will be seen that one noble song on a compulsive theme has survived whole volumes of elaborate, soulless artisanship by even the natural poets.

What is it, then, that chills the “heart and seriousness” of those most artistic and ideal? The rise of conditions adverse to the imaginative exercise of their powers has been acknowledged from the first in these essays. It is clear that instinct has become measurably dulled, as concerns the relative value of efforts; so that poets do not magnify their calling as of old. There is less bounce, and, unfortunately, still less aspiration. Nor has the modern spirit, now freed from sentimental illusions, as yet brought its wits to a thorough understanding of what true Realism is—viz., that which is just as faithful to the ideal and to the soul of things as to obvious and external matters of artistic treatment. Here again the law of reaction will in the end prevail. Its operation is already visible in the demand for more inventive and wholesomely romantic works of fiction; and this is but the forerunner of a corresponding impulse by which the poet—the maker—the creative idealist—

whose office it is to perceive and illumine *all* realties, both material and spiritual, will have his place again.

For a time, however, the revival of creative prose-fiction may occupy more than one poetic mind. Novel-writing is more vigorously pursued than ever, by fresh hands. Journalism opens new and broader courts tempting for their influence, sense of power, and the subsistence yielded. Criticism, book-making, book-editing, are flourishing industries. Scholar's work is steadily pursued, and carried even to analysis of living authors. Our poetry itself is too scholarly. Arnold's happy statement concerning Byron, that "he did not know enough," does not apply to the typical latter-day poet. He has too much learning withal, of a technical, linguistic, treasure-hunting sort. The over-intellectuality and scholarship of many lyrists absorb them in curious studies, and deaden their impulse toward original and glowing efforts. They revive and translate, and borrow far too much the hoardings of all time. Even in their judgments they set an undue value upon the learning, reasoning, philosophy, of a master under discussion. Moreover, their literary skill and acquirements make the brightest of them serviceable aids to the publishers. No sooner are their names in public favor than the great houses smooth their way along the lucrative paths of book-making. Great and small houses have multiplied, and printing is easy and universal. To all this we indeed owe attractive series of critico-biographical volumes, anthologies catholic and select, encyclopædias, translations, and texts without end. Good and welcome as much of this work is, my present question must be — does it not chasten and absorb the poet's faculties? Has he not, at last, too good a literary market? The common-sense reply is that, after all, he must live,—and the belief is antiquated that poets, like caged birds, sing better for starving. Yet if you chance of late upon a unique and terribly earnest bard,—a man like Thompson,—you find that he was out of the literary "swim" and usually out of pocket; while his well-to-do brother more often is the man of letters corresponding to Southey and Wilson rather than to their fiery contemporaries. If the poetic drama, for example, were now more frequently calling for elevated work, imagination and subsistence would both be subserved. The stage does make welcome beautiful and witty verse of a light order, but what it regularly supports is the facile playwright; and its operettas and scenic plays are logically adapted to the zest for amusement and the ruling decorative frenzy.

The desire of the critic and the public alike, and first of all, is for something new and ad-

ditional. But that which is new is of higher worth when it contributes to the furtherance of a true national style. What is Spanish, French, German, we at once recognize as such, however different from previous works of like origin; but how seldom the later Victorian minstrelsy is essentially English! A recent article by W. P. P. Longfellow criticises existing tendencies of architecture in Great Britain. He records the progress of a style which advanced to its culmination with the design for the new Law Courts, and until the "Victorian Gothic was everywhere." He writes that —

"Success was due, not so much to the style chosen as to the fact that, having found a style which suited them, the English followed it unitedly and persistently. Here seemed to be a national movement, strong, deep, and promising to endure. . . . Then, suddenly, at the signal of two or three restless and clever young men, whose eyes had caught something else, the English architects with one accord threw the whole thing away; as a boy, after working the morning through at some plaything, with a sudden weariness drops his unfinished toy to run after the first butterfly. . . . They have seemed to show us that their progress was at the impulse of whim rather than conviction, ruled rather by fashion than tradition. It is the mobile Frenchman who in this century has set us an example of steadiness. If his work, like all the rest in our day, lacks some of the higher qualities of older and greater styles, it has, more than any other modern work, the coherency and firmness that are at the bottom of all style."

The point thus made has a bearing upon more arts than one. A style of architecture, it is true, is the outcome of centuries. Literary style has a readier formation and is quickly affected by individual leadership. Yet a national manner distinguished the most subtle and inclusive of literary forms in every important era. This is not sustained by curious devices and imitations, however choice and attractive, but by harmonizing personal quality with the national note of expression. I think there is a lack of recognizable and pervasive style in our English poetry of the period; that, with the exception of the portion which confessedly revives the manners of Queen Anne's time and the Georgian, it is chiefly English in its intense desire to escape from Anglicism.

What does this imply,—style being a visible emblem of spiritual traits,—other than a want, so far as poetry can indicate it, of individual and national purpose? Breadth, passion, and imagination seem to be the elements least conspicuous in much of the recent song. The new men withdraw themselves from the movement of their time and country, forgetting it all in dreamland—in no-man's-land. They compose sonnets and ballads as inexpressive of the resolution of an imperial and stalwart people as are the figures upon certain

modern canvases — the distraught, unearthly youths and maidens that wander along shadowy meads by nameless streams, with their eyes fixed on some hand we "cannot see, which beckons" them away.

It may be that before we can hope for a return of poetic vigor some heroic crisis must be endured, some experience undergone, of more import than the mock-campaigns in weak and barbarous provinces, whereby Great Britain preserves her military and colonizing traditions, and avoids the stagnation of utter repose. The grand old realm bids fair to have her awakening. There are clouds enough to bode sterner issues and nearer conflicts than she has faced since Cromwell's time. Ireland is filling men's ears with her threats and appeals. In a season of jubilee socialists crowd St. Paul's, their banners inscribed with "Jus-

tice and Liberty, or Death"; the Marseillaise is chorused in London thoroughfares, and London poets sing — triolets. The wise are not swift to pronounce this troubadour insouciance a mark of effeminacy and declining genius. A great dramatist makes Combeferre, Jean Prouvaire, and their comrades within the fated barricade, heroes all, while casting bullets and waiting for the struggle at dawn, sing — not battle-odes but love-songs. England's heroism and imagination are not to be judged by her verse at this moment. Whether the Mother of Nations is to be like Niobe, or long with loyal children to rise up and call her blessed, her poets in fit succession will enrich the noblest imaginative literature of any race or tongue, though, peradventure, "after some time be past."

Edmund C. Stedman.

THE GOING OUT OF THE TIDE.

THE eastern heaven was all faint amethyst,
Whereon the moon hung dreaming in the mist;
To north yet drifted one long delicate plume
Of roseate cloud; like snow the ocean-spume.

Now when the first foreboding swiftly ran
Through the loud-glorying sea that it began
To lose its late-gained lordship of the land,
Uprose the billow like an angered man,
And flung its prone strength far along the sand;
Almost, almost to the old bound, the dark
And taunting triumph-mark.

But no, no, no! and slow, and slow, and slow,
Like a heart losing hold, this wave must go,—
Must go, must go,—dragged heavily back,
back,
Beneath the next wave plunging on its track,
Charging, with thunderous and defiant shout,
To fore-determined rout.

Again, again the unexhausted main
Renews fierce effort, drawing force unguessed
From awful depths of its mysterious breast:
Like arms of passionate protest, tossed in vain,
The spray upflings above the billow's crest.
Again the appulse, again the backward strain,—
Till ocean must have rest.

With one abandoned movement, swift and wild,—

As though bowed head and outstretched arms
it laid
On the earth's lap, soft-sobbing,—hushed and stayed,
The great sea quiets, like a weaned child.
Ha! what sharp memory clove the calm, and drave
This last fleet furious wave?

On, on, endures the struggle into night,
Ancient as Time, yet fresh as the fresh hour;
As oft repeated since the birth of light
As the strong agony and mortal fight
Of human souls, blind-reaching, with the Power
Aloof, unmoved, impossible to cross,
Whose law is seeming loss.

Low-sunken from the longed-for triumph-mark,
The spent sea sighs, as one that grieves in sleep.
The unveiled moon along the rippling plain
Casts many a keen, cold, shifting silvery spark,
Wild as the pulses of strange joy, that leap
Even in the quick of pain.

And she compelling, she that stands for law,—
As law for Will eternal,—perfect, clear,
And uncompassionate shines: to her appear
Vast sequences close-linked without a flaw.
All past despairs of ocean unforgot,
All raptures past, serene her light she gives,
The moon too high for pity, since she lives
Aware that loss is not.

Helen Gray Cone.

ARMY'S TROOPS RESTORING RAILROADS AT ATLANTA. FROM A PHOTOGRAPH.

MARCHING THROUGH GEORGIA AND THE CAROLINAS.

A FORAGER

new field. Some of our "Potomac airmen," which had earned us the name of "Kid gloves and paper collars,"* began to wear away as we better understood the important work to be done by the great army organizing around us, and of which we were to form a considerable part. A most interesting feature of these preparations was the reequipping of the old three-years regiments. The two Potomac corps were consolidated, and we of the Twelfth who wore "the bloody star" were apprehensive lest different insignia should be adopted; but the star became the badge of the new (Twentieth) corps, the crescent men amiably dropping their Turkish emblem. Slocum, who had commanded the Twelfth so long, was assigned to command at Vicksburg, but was recalled to succeed Hooker in the command of the Twentieth Corps when

TO us of the Twelfth Corps who had gone West with the Eleventh Corps from the Army of the Potomac, the distant thunder of "the battle of the clouds" was the first sound of conflict in the

toward the end of August, 1864, Hooker asked to be relieved because Howard, who was his junior, had been placed at the head of the Army of the Tennessee to fill the vacancy made by the death of McPherson at Atlanta. This temporary separation from our commander was hard, as all will remember who crowded to his headquarters on the evening of April 7th, 1864. But the sorrow of the hour was dispelled by the generous hospitality of his staff and his indulgent order to waive all rank for the occasion.

We observed in the Western troops an air of independence hardly consistent with the nicest discipline; but this quality appeared to some purpose at the battle of Resaca, where we saw our Western companions deliberately leave the line, retire out of range, clean their guns, pick up ammunition from the wounded, and return again to the fight. This cool self-reliance excited our admiration. On we went in a campaign of continual skirmishes and battles that ended in the capture of Atlanta. The *morale* of the troops had been visibly improved by this successful campaign.

On my way to army headquarters at Atlanta to call upon a staff friend, I met General Sherman, who acknowledged my salute with a familiar "How do you do, Captain." Scrutinizing the insignia on my cap, he continued, "Second Massachusetts? Ah, yes, I know

* The Twelfth Corps of the Army of the Potomac was named "Kid gloves and paper collars" by the Fourteenth Corps of the Western Army owing to the West Point discipline of the Twelfth Corps, which was the natural result of having been commanded, first by Mans-

field and then by Slocum, while it contained as subordinate commanders such men as Williams, Hamilton, Gordon, Ruger, Andrews, Hawley, and others. This discipline continued to the end and had its effect upon other troops.—D. O.

your regiment; you have very fine parades over there in the park."

Sherman could be easily approached by any of his soldiers, but no one could venture to be familiar. His uniform coat, usually wide open at the throat, displayed a not very military black cravat and linen collar, and he generally wore low shoes and one spur. On the march he rode with each column in turn, and

pound of baggage which could be dispensed with. The army was reduced, one might say, to its fighting weight, no man being retained but those capable of a long march. Our communications were then abandoned by destroying the railroad and telegraph. There was something intensely exciting in this perfect isolation. No commander but Sherman, we thought, would have dared this; other men would have shrunk from gloomy possibilities of starvation and final capture.

The engineers had peremptory orders to avoid any injury to dwellings, but to apply gunpowder and the torch to public buildings, machine shops, depots, and arsenals. Sixty thousand of us witnessed the destruction of Atlanta, while our post band and that of the 33d Massachusetts played martial airs and operatic selections. It was a night never to be forgotten. Our regular routine was a mere form, and there could be no "taps" amid the brilliant glare and excitement.

The throwing away of superfluous conveniences began at daybreak. The old campaigner knows what to carry and what to throw away. Each group of messmates decided which hatchet, stew-pan, or coffee-pot should be taken. The single wagon allowed to a battalion carried scarcely more than a grip-sack and blanket, and a bit of shelter tent about the size of a large towel for each officer, and only such other material as was necessary for regimental business.

Transportation was reduced to a minimum, and fast marching was to be the order of the day. Wagons to carry the necessary ammunition in the contingency of a battle, and a few days' rations in case of absolute need, composed the train of each army corps, and with one wagon and one ambulance for each regiment made very respectable "impedimenta," averaging about eight hundred wagons to a corps.

At last came the familiar "Fall in"; the great "Flying Column" was on the march, and the last regiment in Atlanta turned its back upon the smoking ruins. Our left wing (the Fourteenth and Twentieth corps under Slocum) seemed to threaten Macon, while the right wing (the Fifteenth and Seventeenth corps under Howard) bent its course as if for Augusta. Skirmishers were in advance, flankers were out, and foraging parties were ahead gathering supplies from the rich plantations. We were all old campaigners, so that a brush with the

THE FATE OF THE RAIL FENCE.

often with no larger escort than a single staff-officer and an orderly. In passing us on the march he acknowledged our salutations as if he knew us all, but hadn't time to stop. On "the march to the sea" a soldier called out to Sherman, "Uncle Billy, I guess Grant's waiting for us at Richmond." Sherman's acquaintance among his officers was remarkable, and of great advantage, for he learned the character of every command, even of regiments, and could assign officers to special duties, with knowledge of those who were to fill the vacancies so made. The army appreciated these personal relations, and every man felt in a certain sense that Sherman had his eye on him.

Before the middle of November, 1864, the inhabitants of Atlanta, by Sherman's orders, had left the place. Serious preparations were making for the march to the sea. Nothing was to be left for the use or advantage of the enemy. The sick were sent back to Chattanooga and Nashville along with every

militia now and then or with Hardee's troops made no unusual delay; and Wheeler's cavalry was soon disposed of. We were expected to make fifteen miles a day, to corduroy the roads where necessary; to destroy such property as was designated by our corps commander, and to consume everything eatable by man or beast.

Milledgeville proved to be Sherman's first objective, and both wings came within less than supporting distance in and around the capital of the State. Our colored friends, who flocked to us in embarrassing numbers, told many stories about the fear and flight of the inhabitants at the approach of Sherman.

Cock-fighting became one of the pastimes of the "Flying Column." Many fine birds were brought in by our foragers. Those found deficient in courage and skill quickly went to the stew-pan in company with the modest barn-yard fowl, but those of redoubtable valor won an honored place and name, and were to be seen riding proudly on the front seat of an artillery caisson, or carried tenderly under the arm of an infantry soldier.

Our next objective was Savannah. Hazen's capture of Fort McAllister opened the gates of that beautiful city, while Hardee managed to escape with his little army; and Sherman, in a rather facetious dispatch, presented the city to Mr. Lincoln as a Christmas gift. Flushed with the success of our march, we settled down for a rest. Our uniforms were the worse for wear, but the army was in fine condition and fully prepared for the serious work ahead.

In the middle of December in the neighborhood of Savannah, after Hardee's troops had nearly exhausted the country, which was now mainly under water, there was little opportunity for the foragers to exercise their talents, and some of them returned to the ranks. The troops bivouacked here and there in comparatively dry spots, while picket duty had to be performed at many points in the water. In going from Sister's Ferry to Robertsville where my regiment was in bivouac I waded for a mile and a half in water knee-deep. At Purisburg the pickets were all afloat in boats and scows and on rafts, and the crest-fallen foragers brought in nothing but rice, which became unpalatable when served three times a day for successive weeks. At length when we left Savannah and launched cheerily into the untroubled land of South Carolina, the foragers began to assume their wonted spirit. We were proud of our foragers. They constituted a picked force from each regiment, under an officer selected for the command, and were remarkable for intelligence, spirit, and daring. Before daylight, mounted on horses captured on the plantations, they were in the saddle, and away, covering the country sometimes seven

miles in advance. Although I have said "in the saddle," many a forager had nothing better than a bit of carpet and a rope halter; yet this simplicity of equipment did not abate his power of carrying off hams and sweet-potatoes in the face of the enemy. The foragers were also important as a sort of advanced guard, for they formed virtually a curtain of mounted infantry screening us from the inquisitive eyes of parties of Wheeler's cavalry, with whom they did not hesitate to engage when it was a question of a rich plantation.

When compelled to retire, they resorted to all the tricks of infantry skirmishers, and summoned reinforcements of foragers from other regiments to help drive the "Johnnies" out. When success crowned their efforts, the plantation was promptly stripped of live stock and eatables. The natives were accustomed to bury provisions, for they feared their own soldiers quite as much as they feared ours. These subterranean stores were readily discovered by the practiced "Yankee" eye. The appearance of the ground and a little probing with a ramrod or a bayonet soon decided whether to dig. Teams were improvised; carts and vehicles of all sorts were pressed into the service and loaded with provisions. If any antiquated militia uniforms were discovered, they were promptly donned, and a comical procession escorted the valuable train of booty to the point where the brigade was expected to bivouac for the night. The regimentals of the past, even to those of revolutionary times, were often conspicuous.

On an occasion when our brigade had the advance, several parties of foragers, consolidating themselves, captured a town from the enemy's cavalry, and occupied the neighboring plantations. Before the arrival of the main column hostilities had ceased; order had been restored, and mock arrangements were made to receive the army. Our regiment in the advance was confronted by a picket dressed in continental uniform, who waved his plumed hat in response to the gibes of the men, and galloped away on his bareback mule to apprise his comrades of our approach. We marched into the town and rested on each side of the main street. Presently a forager, in ancient militia uniform indicating high rank, debouched from a side street to do the honors of the occasion. He was mounted on a Rozinante with a bit of carpet for a saddle. His old plumed chapeau in hand, he rode with gracious dignity through the street, as if reviewing the brigade. After him came a family carriage laden with hams, sweet-potatoes, and other provisions, and drawn by two horses, a mule, and a cow, the two latter ridden by postilions.

At Fayetteville, North Carolina, the foragers

SHERMAN'S MARCHES
THROUGH
GEORGIA AND THE CAROLINAS
1864 - 5.

as usual had been over the ground several hours before the heads of column arrived, and the party from my regiment had found a broken down grist-mill. Their commander, Captain Parker, an officer of great spirit and efficiency, and an expert machinist, had the old wheel hoisted into its place and put the mill in working order. Several parties from other regiments had been admitted as working mem-

FIG. 1. MOUNTAIN. (FROM A WAR-TIME SKETCH.)

bers, and teams of all sorts were busy collecting and bringing in corn and carrying away meal for distribution. This bit of enterprise was so pleasing to the troops that plenty of volunteers were ready to relieve the different gangs, and the demand was so great as to keep the mill at work all night by the light of pine-knot fires and torches.

The march through Georgia has been called a grand military promenade, all novelty and excitement. But its moral effect on friend and foe was immense. It proved our ability to lay open the heart of the Confederacy, and left the question of what we might do next a matter of doubt and terror. It served also as a preliminary training for the arduous campaign to come. Our work was incomplete while the Carolinas, except at a few points on the seacoast, had not felt the rough contact of war. But their swamps and rivers, swollen and spread into lakes by winter floods, presented obstructions almost impracticable to an invading army, if opposed by even a very inferior force.

The task before us was indeed formidable. It involved exposure and indefatigable exertion. To succeed, our forward movement had to be continuous, for even the most productive regions would soon be exhausted by our sixty thousand men and more, and thirteen thousand animals.

Although we were fully prepared, with our great trains of ammunition, to fight a pitched battle, our mission was not to fight, but to consume and destroy. Our inability to care properly for the wounded, who must necessarily be carried along painfully in jolting ambu-

lances to die on the way from exhaustion and exposure, was an additional and very serious reason for avoiding collision with the enemy. But where he could not be evaded, his very presence across our path increased the velocity of our flying column. We repelled him by a decisive blow and without losing our momentum.

The beginning of our march in South Carolina was pleasant; the weather favorable and the country productive. Sometimes at the midday halt a stray pig that had cunningly evaded the foragers would venture forth in the belief of having escaped "the cruel war," and would find his error, alas! too late, by encountering our column. Instantly an armed mob would set upon him, and his piercing shrieks would melt away in the scramble for fresh pork. But the midday sport of the main column and the happy life of the forager were sadly interrupted. The sun grew dim, and the rain came and staid. A few of our excellent foragers were reported captured by Wheeler's cavalry, while we sank deeper and deeper in the mud as we approached the Salkehatchie swamp which lay between us and the Charleston and Augusta railroad. As the heads of column came up, each command knew what it had to do. Generals Mower and G. A. Smith got their divisions across by swimming, wading, and floating, and effected lodgments in spite of the enemy's fire. An overwhelming mass of drenched and muddy veterans swept away the enemy, while the rest of our force got the trains and artillery over by corduroying, pontooning, and bridging. It seemed a grand day's work to have accomplished, as we sank down that night in our miry bivouac. The gallant General Wager Swayne lost his leg in this Salkehatchie encounter. Luckily for him and others, we were not yet too far from our friends to send the wounded back, with a strong escort, to Pocotaligo.

We destroyed about forty miles of the Charleston and Augusta railroad, and by threatening points beyond the route we intended to take, we deluded the enemy into concentrating at Augusta and other places, while we marched rapidly away, leaving him well behind, and nothing but Wade Hampton's cavalry, and the more formidable obstacle of the Saluda River and its swamps, between us and Columbia, our next objective. As the route of our column lay west of Columbia, I saw nothing of the oft described and much discussed burning of that city.

During the hasty removal of the Union prisoners from Columbia two Massachusetts officers managed to make their escape. Exhausted and almost naked, they found their way to my command. My mess begged for

ARRIVAL OF A FORAGING PARTY.

the privilege of caring for one of them. We gave him a mule to ride with a comfortable saddle, and scraped together an outfit for him, although our clothes were in the last stages. Our guest found the mess luxurious, as he sat down with us at the edge of a rubber blanket spread upon the ground for a tablecloth, and set with tin cups and platters. Stewed fighting-cock and bits of fried turkey were followed by fried corn-meal and sorghum. Then came our coffee and pipes, and we lay down by a roaring fire of pine-knots, to hear our guest's story of life in a rebel prison. Before daybreak the tramp of horses reminded us that our foragers were sallying forth. The red light from the countless camp-fires melted away as the dawn stole over the horizon, casting its wonderful gradations of light and color over the masses of sleeping soldiers, while the smoke from burning pine-knots befogged the chilly morning air. Then the bugles broke the impressive stillness, and the roll of drums was heard on all sides. Soon the scene was alive with blue coats and the hubbub of roll-calling, cooking, and running for water to the nearest spring or stream. The surgeons looked to

the sick and footsore, and weeded from the ambulances those who no longer needed to ride.

It was not uncommon to hear shots at the head of the column. The foragers would come tumbling back, and ride alongside the regiment, adding to the noisy talk their account of what they had seen, and dividing among their comrades such things as they had managed to bring away in their narrow escape from capture. A staff-officer would gallop down the roadside like a man who had forgotten something which must be recovered in a hurry. At the sound of the colonel's ringing voice, silence was instant and absolute. Sabers flashed from their scabbards, the men brought their guns to the "carry," and the battalion swung into line at the roadside; cats, fighting-cocks, and frying-pans passed to the rear rank; officers and sergeants buzzed round their companies to see that the guns were loaded and the men ready for action. The color-sergeant loosened the water-proof cover of the battle-flag, a battery of artillery flew past on its way to the front, following the returning staff-officer, and we soon heard the familiar bang of shells. Perhaps it

did not amount to much after all, and we were soon swinging into "route step" again.

At times when suffering from thirst it was hard to resist the temptation of crystal swamp water, as it rippled along the side of a causeway, a tempting sight for the weary and un-
way. In spite of oft-repeated cautions, some contrived to drink it, but these were on their backs with malarial disease at the end of the campaign, if not sooner.

After passing Columbia there was a brief season of famine. The foragers worked hard, but found nothing. They made amends, however, in a day or two, bringing in the familiar corn-meal, sweet-potatoes, and bacon.

We marched into Cheraw with music and with colors flying. Stacking arms in the main street, we proceeded to supper, while the engineers laid the pontoons across the Pedee River. The railing of the town pump, and the remains of a buggy, said to belong to Mr. Lincoln's brother-in-law, Dr. Todd, were quickly reduced to kindling-wood to boil the coffee. The necessary destruction of property was quickly accomplished, and on we went. A mile from the Lumber River the country, already flooded ankle-deep, was rendered still more inhospitable by a steady down-pour of rain. The bridges had been partly destroyed by the enemy, and partly swept away by the flood. An attempt to carry heavy army wagons and artillery across this dreary lake might

have seemed rather fool-hardy, but we went to work without loss of time. The engineers were promptly floated out to the river, to direct the rebuilding of bridges, and the woods all along the line of each column soon rang with the noise of axes. Trees quickly became logs, and were brought to the submerged roadway. No matter if logs disappeared in the floating mud; thousands more were coming from all sides. So, layer upon layer, the work went bravely on. Soon the artillery and wagons were jolting over our wooden causeway.

As my regiment was the rear-guard for the day, we had various offices to perform for the train, and it was midnight before we saw the last wagon over the bridge by the light of our pine torches. It seemed as if that last wagon was never to be got-over. It came bouncing and bumping along, its six mules smoking and blowing in the black, misty air. The teamster, mounted on one of the wheelers, guided his team with a single rein and addressed each mule by name, reminding the animal of his faults, and accusing him of having among other peculiarities "a black military heart." Every sentence of his oath-adorned rhetoric was punctuated with a dexterous whip-lash. At last, drenched to the skin and covered with mud, I took my position on the bridge, seated in a chair which one of my men had presented to me, and waited for the command to "close up."

FROM A PHOTOGRAPH.

As we passed the wagon camp, there was the deafening, indescribable choras of mules and teamsters, besides the hoarse shouting of quartermasters, and wagonmasters plunging about on horseback through the mud, to direct the arriving teams into their places. But it all died away in the distance as we marched on to find the oozy resting-place of the brigade. The army had been in bivouac some hours, and countless camp-fires formed a vast belt of fire that spread out into the black night.

As we advanced into the wild pine regions of North Carolina the natives seemed wonderfully impressed at seeing every road filled with marching troops, artillery, and wagon trains. They looked destitute enough as they stood in blank amazement gazing upon the "Yanks" marching by. The scene before us was very striking; the resin pits were on fire, and great columns of black smoke rose high into the air, spreading and mingling together in gray clouds, and suggesting the roof and pillars of a vast temple. All traces of habitation were left behind, as we marched into that grand forest with its beautiful carpet of pine-needles. The straight trunks of the pine-trees shot up to a great height, and then spread out into a green roof, which kept us in perpetual shade. As night came on, we found that the

resinous sap in the cavities cut in the trees to receive it, had also been lighted by "bummers" in our advance. The effect of these peculiar watch fires on every side, several feet above the ground, with flames licking their way up the tall trunks, was peculiarly striking and beautiful. But it was sad to see this wanton destruction of property, which, like the firing of the resin pits, was the work of "bummers," who were marauding through the country committing every sort of outrage. There was no restraint except with the column or the regular foraging parties. We had no communications, and could have no safeguards. The country was necessarily left to take care of itself, and became a "howling waste." The "coffee-coolers" of the Army of the Potomac were archangels compared to our "bummers," who often fell to the tender mercies of Wheeler's cavalry, and were never heard of again, earning a fate which was richly deserved.

On arriving within easy distance of the Cape Fear River, where we expected to communicate with the navy, detachments were sent in rapid advance to secure Fayetteville. Our division, after a hard day of corduroying in various spots over a distance of twelve miles, went into camp for supper, and then, taking the plank-road for Fayetteville, made a moonlight march of nine miles in three hours,

THE MARCHING OF THE ARMY OF THE POTOMAC.

but our friends from the right wing arrived there before us.

Hardee retired to a good position at Averysboro', where Kilpatrick found him intrenched, and too strong for the cavalry to handle unassisted. It was the turn of our brigade to do special duty, so at about 8 o'clock in the evening we were ordered to join the cavalry. We were not quite sure it rained, but everything was dripping. The men furnished themselves with pine-knots, and our weapons glistened in the torchlight, a cloud of black smoke from the torches floating back over our heads. The regimental wits were as ready as ever, and amid a flow of lively badinage we toiled on through the mud.

When the column was halted for a few minutes to give us an opportunity of drawing breath, I found Sergeant Johnson with one arm

daring leader, often resulting in exciting or amusing events.

The clear wintry dawn disclosed a long line of blue coats spread over the ground in motionless groups. This was the roaring torchlight brigade of the night before. The orders "fall in"—"forward!" in gruff tones broke upon the chilly air, and brought us shivering to our feet. We moved to the edge of the woods with the cavalry. As Kilpatrick and Hawley, our brigade commander, rode by, I heard Hawley say, "No, sir, I shall not charge until I find out what is on my flanks." The skirmish line, under Captain J. I. Grafton, had already disappeared into the opposite belt of woods, and evidently was losing no time in developing the enemy, and ascertaining his force. They were drawing his fire from all points, indicating a force more than double that of our

SHERMAN'S "BUMMERS" CAPTURING FAYETTEVILLE C. H. (FROM A SKETCH MADE AT THE TIME.)

in the mud up to the elbow. He explained that he was trying to find his shoe. We floundered on for five miles, and relieved a brigade of Kilpatrick's men whom we found in some damp woods. There was a comfort in clustering round their camp-fires, while they retired into outer darkness to prepare for the morning attack. But the cavalry fireside was only a temporary refuge from the storm, for we also had to depart into the impenetrable darkness beyond, to await in wet line of battle the unforeseen. Those who were sufficiently exhausted sank down in the mud to sleep, while others speculated on the future. Something uncommon was expected from the peculiar "go" of the cavalry column under its

brigade. Dismounted cavalry were now sent forward to prolong the skirmish line. Captain J. I. Grafton was reported badly wounded in the leg, but still commanding with his usual coolness. Suddenly he appeared staggering out of the wood into the open space in our front, bareheaded, his face buried in his hands, his saber hanging by the sword-knot from his wrist, one leg bound up with a handkerchief, his uniform covered with blood; on he came, until at commanding distance from the line he dropped his hands, raised his head with the old air of command, and seemed to gaze over our heads for a moment. His face wore the look of death, and in a moment he fell towards the colors. Officers clustered about him in si-

lence, and a gloom spread through the brigade as word passed from wing to wing that Grafton was dead.

The main column was now arriving, and as the troops filed off to the right and left of the road, and the field-guns galloped into battery, we moved forward to the attack. The enemy gave us a hot reception, which we returned with a storm of lead. It was a wretched place for a fight. At some points we had to support our wounded, until they could be carried off, to prevent their falling into the swamp water in which we stood ankle-deep. Here and there a clump of thick growth in the black mud broke the line as we advanced. No ordinary troops were in our front. They would not give way until a division of Davis's corps was thrown upon their right, while we pressed them closely. As

we passed over their dead and wounded, I came upon the body of a very young officer, whose handsome refined face attracted my attention. While the line of battle swept past me, I knelt at his side for a moment. His buttons bore the arms of South Carolina. Evidently we were fighting the Charleston chivalry. I cut off a button as a memento, and rejoined the line. Sunset found us in bivouac on the Goldsboro' road, and Hardee in retreat.

As we trudged on towards Bentonville distant sounds told plainly that the head of the column was engaged. We hurried to the front and went into action, confronting with Davis's corps. Little opposition having been expected,

MARCHING BY FORELIGHT.

the distance between our wing and the right wing had been allowed to increase beyond supporting distance in the endeavor to find easier roads for marching as well as for transporting the wounded. The scope of this paper precludes a description of the battle of Bentonville, which was a combination of mistakes, miscarriages, and hard fighting on both sides. It ended in Johnston's retreat, leaving open the road to Goldsboro', where we arrived ragged and almost barefoot. While we were receiving letters from home, getting new clothes, and taking our regular doses of quinine, Lee and Johnston surrendered, and the great conflict came to an end.

Daniel Oakley.

ADVANCING UNDER DIFFICULTIES.

SHERMAN'S MARCH FROM SAVANNAH TO BENTONVILLE.

GENERAL SHERMAN'S army commenced its march from "Atlanta to the Sea" on the morning of November 15th, and arrived in front of the defenses of Savannah on the 10th of December, 1864. No news

had been received from the North during this interval, except such as could be gleaned from Southern papers picked up by the soldiers on the line of our march. Our fleet was in Ossabaw Sound with supplies of food and clothing, and an immense mail, containing letters from home for nearly every one in the army, from the commanding general down to the private soldier. All that blocked our communication with the fleet was Fort McAllister on the Ogeechee River. This fort was captured by Hazen's division of the Fifteenth Corps on December 13th, and the 15th brought us our mails and an abundant supply of food and ammunition, making this one of the happiest days experienced by the men of Sherman's army. Preparations were at once commenced for assaulting the Confederate works, and were nearly completed when the Confederates evacuated Savannah. Our troops entered the city before daybreak on the 21st of December. The fall of Fort McAllister placed General Sherman in communication with

General Grant and the authorities at Washington. Prior to the capture of Savannah, the removal of the infantry of Sherman's army to City Point by sea was the plan contemplated by General Grant. On December 6th General Grant wrote to Sherman:

"My idea now is that you establish a base on the sea-coast, fortify and leave all your artillery and cavalry and enough infantry to protect them, and at the same time so threaten the interior that the militia of the South will have to be kept home. With the balance of your command come here with all dispatch."

In reply, under date of December 13th, Sherman said:

"I had expected, after reducing Savannah, instantly to march to Columbia, South Carolina, thence to Raleigh, and then to report to you."

The fall of Savannah resulted in the adoption of the plan which Sherman had contemplated. In a letter dated December 24th Sherman says:

"Many and many a person in Georgia asked me why I did not go to South Carolina, and when I answered that we were *en route* for that State, the invariable reply was, 'Well, if you will make those people feel the utmost severities of war we will pardon you for your desolation of Georgia.'"

About one month was spent in Savannah in clothing the men, and filling the trains with ammunition and rations. Then commenced the movement which was to make South Carolina

feel the severities of war.* The right wing, with the exception of Corse's division of the Seventeenth Corps, moved from Hilton Head to Beaufort. The left wing with Corse's division and the cavalry moved up the west bank of the Savannah River to Sister's Ferry, distant about forty miles from Savannah. Sherman's plan was similar to that adopted on leaving Atlanta. When the army started from Atlanta, the right wing moved directly towards Macon, and the left towards Augusta. Both cities were occupied by Confederate troops. The movements of our army caused the Confederate authorities at each of these important cities to demand not only the retention of the troops at each place, but induced them to demand help from every quarter. Sherman had no

and leave both cities in our rear, with little or no force in our front. On leaving Savannah our right wing threatened Charleston and the left again threatened Augusta, the two wings being again united in the interior of South Carolina, leaving the Confederate troops at Augusta with almost a certainty that Charleston must fall without a blow from Sherman. On the arrival of the left wing at Sister's Ferry on the Savannah, instead of finding, as was anticipated, a river a few yards in width which could be easily crossed, they found a broad expanse of water which was utterly impassable. The continuous rain-fall had caused the river to overflow, so that the lowland on the South Carolina side was covered with water, extending nearly half a mile from the

THE SOUTH END-10, S. C., ON A FLOATING FOOT-BRIDGE. (FROM A SKETCH MADE AT THE TIME.)

thought of attacking either place, and at the proper time the movements of both wings of the army were so directed as to unite them

river. We were delayed several days in vain efforts to effect a crossing, and were finally compelled to await the falling of the waters.

"As the late General Lee expressed the following letter to the Governor of South Carolina, HENRY RITCHIE, ARMY, N. VA., 22 January, 1862: His Excellency A. G. MAGRAUTH, Governor of South Carolina, Columbia, S.C. I received today your letter of the 17th inst. and regret exceedingly to learn the present unfortunate position of the South. I feel from your letter that you are not able to do much to arrest the march of General Sherman. If such were the case I should not have waited for your application, but I cannot do much as you do for present success, and am anxious that they result from his further progress. I have no strong complaints within the Department within which my services are required. According to your statement of General Sherman's tactics it would require the whole army to oppose him. It is now understood by General Grant with a fair success army. Did we transferred to South Carolina, I do not believe General Grant would encounter on the James River. It would be given for the purpose for army units as for General Sherman to achieve results. You can judge whether the condition of affairs would be affected by a combination of the two large Federal armies in South Carolina, with the rest of the Confederacy around of failure. But should Charleston fall into the hands of the enemy, as general as would be the blow and as painful the result, I cannot consent to the opinion of your Excellency that

our cause would necessarily be lost. Should our whole coast fall into the possession of our enemies, with our people true, firm, and united, the war could be continued and our purpose accomplished. As long as our armies are unsubdued and sustained, the Confederacy is safe. I therefore think it bad policy to shut our troops within intrenchments, where they can be besieged with superior forces, and prefer operating in the field. I recommend this course in South Carolina, and advise that every effort be made to prevent General Sherman reaching Charleston by contesting his advance. The last return made by General Hardee of his force which I have seen, gave his entire strength 20,500 of all arms; with 5000 South Carolina militia which he expected, and 1500 Georgia troops under General G. W. Smith, he would have 27,000. This is exclusive of Connor's brigade and Butler's division sent from this army, which ought to swell his force to thirty-three thousand. But I think it might be still further increased by a general turn out of all the men in Georgia and South Carolina, and that Sherman could be resisted until General Beauregard could arrive with reinforcements from the West. I see no cause for depression or despondency, but abundant reason for renewed exertion and unyielding resistance. With great respect, your Excellency's obedient servant, R. E. LEE, General. [Printed from the MS.—Editor.]

RAILWAY DESTRUCTION AS A MILITARY ART.†

Our pontoon-bridge was finally constructed and the crossing commenced. Each regiment as it entered South Carolina gave three cheers. The men seemed to realize that

at last they had set foot on the State which had done more than all others to bring upon the country the horrors of civil war. In the narrow road leading from the ferry on the

† A knowledge of the art of building railroads is certainly of more value to a country than that of the best means of destroying them; but at this particular time the destruction seemed necessary, and the time may again come when such work will be necessary. Lest the most effectual and expeditious method of destroying railroad tracks should become one of the lost arts, I will here give a few rules for the guidance of officers who may in future be charged with this important duty. It should be remembered that these rules are the result of long experience and close observation. A detail of men to do the work should be made on the evening before operations are to commence. The number to be detailed being, of course, dependent upon the amount of work to be done, I estimate that one thousand men can easily destroy about five miles of track per day, and do it thoroughly. Before going out in the morning the men should be supplied with a good breakfast, for it has been discovered that soldiers are more efficient at this work, as well as on the battle-field, when their stomachs are full than when they are empty. The question as to the food to be given the men for breakfast is not important, but I suggest roast turkeys, chickens, fresh eggs, and coffee, for the reason that in an enemy's country such a breakfast will cause no unpleasantness between the commissary and the soldiers, inasmuch as the commissary will only be required to provide the coffee. In fact it has been discovered that an army moving through a hostile but fertile country, having an efficient corps of foragers (vulgarly known in our army as bummers), requires but few articles of food, such as hard-tack, coffee, salt, pepper, and sugar. Your detail should be divided into three sections of about equal numbers. I will suppose the detail to consist of three thousand men. The first thing to be done is to reverse the relative positions of the ties and

iron rails, placing the ties up and the rails under them. To do this, Section No. 1, consisting of one thousand men, is distributed along one side of the track, one man at the end of each tie. At a given signal each man seizes a tie, lifts it gently till it assumes a vertical position, and then at another signal pushes it forward so that when it falls the ties will be over the rails. Then each man loosens his tie from the rail. This done, Section No. 1 moves forward to another portion of the road, and Section No. 2 advances and is distributed along the portion of the road recently occupied by Section No. 1. The duty of the second section is to collect the ties, place them in piles of about thirty ties each—place the rails on the top of these piles, the center of each rail being over the center of the pile, and then set fire to the ties. Section No. 2 then follows No. 1. As soon as the rails are sufficiently heated Section No. 3 takes the place of No. 2, and upon this devolves the most important duty, viz., the effectual destruction of the rail. This section should be in command of an efficient officer who will see that the work is not slighted. Unless closely watched, soldiers will content themselves with simply bending the rails around trees. This should never be permitted. A rail which is simply bent can easily be restored to its original shape. No rail should be regarded as properly treated till it has assumed the shape of a doughnut; it must not only be bent but twisted. To do the twisting Poe's railroad hooks are necessary, for it has been found that the soldiers will not seize the hot iron barehanded. This, however, is the only thing looking towards the destruction of property which I ever knew a man in Sherman's army to decline doing. With Poe's hooks a double twist can be given to a rail which precludes all hope of restoring it to its former shape except by recasting.—H. W. S.

THE RIGHT WING—GENERAL HOWARD CROSSING THE SALUDA RIVER. (FROM A SKETCH MADE AT THE TIME.)

South Carolina side torpedoes had been planted, so that several of our men were killed or wounded by treading upon them. This was unfortunate for that section of the State. Planting torpedoes for the defense of a position is legitimate warfare, but our soldiers regarded the act of placing them in a highway where no contest was anticipated as something akin to poisoning a stream of water. It is not recognized as fair or legitimate warfare. If that section of South Carolina suffered more severely than any other, it was due in part to the blundering of people who were more zealous than wise.

About February 10th the two wings of the army were reunited in the vicinity of Branchville, a small village on the South Carolina Railroad at the point where the railroad from Charleston to Columbia branches off from Charleston to Augusta. Here we resumed the work which had occupied so much of our time in Georgia, viz., the destruction of railroads.

Having effectually destroyed over sixty miles of railroads in this section, the army

started for Columbia, the capital of South Carolina, each corps taking a separate road. The left wing (Slocum) arrived at a point about three miles from Columbia on the 16th, and there received orders to cross the Saluda River, at Mount Zion's Church. The Fourteenth moved to the crossing, built a bridge during the night, crossed the river next day, and was followed by the Twentieth Corps and Kilpatrick's cavalry. The right wing (Howard) moved directly to Columbia, the Fifteenth Corps moving through the city and camping outside on the Camden road. The Seventeenth Corps did not enter Columbia. During the night of February 17th the greater portion of the city of Columbia was burned. The lurid flames could easily be seen from my camp, many miles distant. Nearly all the public buildings, several churches, an orphan asylum, and many of the residences were destroyed. The city was filled with helpless women and children and invalids, many of whom were rendered houseless and homeless in a single night. No sadder scene was presented during the war. The suffering of so

many helpless and innocent persons could not but move the hardest heart. The question as to who was immediately responsible for this disaster has given rise to some controversy. I do not believe that General Sherman countenanced or was in any degree responsible for it. I believe a free use of whisky (which was supplied to the soldiers by citizens with great liberality) was the immediate cause of the disaster. Primarily the responsibility must forever rest upon those who should have been the protectors of these helpless people. For more than a quarter of a century South Carolina had, to use a common expression, been absolutely "spoiling for a fight." No statesman, however eminent, could do anything which rendered him so

SHERMAN'S ARMY CROSSING THE SUMMIT OF MOUNT ZION, COLUMBIA. (FROM A SKETCH MADE AT THE TIME.)

odious to that State, as to propose compromise measures which contemplated a peaceful solution of the troubles between the two sections of our country. Clay and Webster both tried it, only to be condemned by these people. She

the war fever, they will do well to remember that while politicians can inaugurate a war they can seldom close one. While they can predict with great accuracy the vicinity in which the first battle will be fought, they can never tell where the last one is to occur. A drunken soldier with a musket in one hand and a

THE UNFINISHED CAPITOL, COLUMBIA.

attempted the destruction of the Union during the presidency of Jackson. Upon the election of Lincoln she could not wait to learn his policy; she could not wait even to consult with her sister States of the South,—she took the initiative. Now that the result for which she had labored so long had been accomplished, it would have been regretted by the entire North, and I think by many at the South, had the performance closed without giving her an opportunity to witness the results and feel the effects of her long-continued efforts.

If the people of any section of our country should in the future become infected with

match in the other is not a pleasant visitor to have about the house on a dark, windy night, particularly when for a series of years you have urged him to come, so that you might have an opportunity of performing a surgical operation on him.

From Columbia the army moved towards Fayetteville—the left wing crossing the Catawba River at Rocky Mount. While the rear of the Twentieth Corps was crossing, our pon-

toon-bridge was swept away by flood wood brought down the river, leaving the Fourteenth Corps on the south side. This caused a delay of three days, and gave rise to some emphatic instructions from General Sherman to the commander of the left wing of his Army—which instructions resulted in our damming the flood-wood to some extent, but not in materially expediting the march.

We arrived at Cheraw on the 3d of March, where we found a large supply of stores sent from Charleston for safe-keeping. Among the stores was a large quantity of very old wine of the best quality, which had been kept in the cellars of Charleston many years, with no thought on the part of the owners that in its old age it would be drunk from tin cups by Yankee soldiers. Fortunately for the whole army the wine was discovered by the Seventeenth Corps and fell into the hands of the generous and chivalrous commander of that corps,—General Frank P. Blair,—who distributed it with the spirit of liberality and fairness characteristic of him. On the 6th we moved towards Fayetteville, where we arrived on the 10th. The march through South Carolina had been greatly delayed by the almost incessant rains and the swampy nature of the country. More than half the way we were compelled to corduroy the roads before our trains could be moved. To accomplish this work we had been supplied with an abundance of axes, and the country was covered with saplines well suited to the purpose.

Three or four days prior to our arrival at Fayetteville General Sherman had received

MAJOR-GENERAL FRANK P. BLAIR, COMMANDING SEVENTEENTH ARMY CORPS.
(FROM A PHOTOGRAPH.)

information that Wilmington was in possession of General Terry, and had sent two messengers with letters informing Terry when he would probably be at Fayetteville.* Both messengers arrived safely at Wilmington, and on Sunday, the day after our arrival at Fayetteville, the shrill whistle of a steamboat floating the Stars and Stripes announced that we were once more in communication with our own friends. As she came up, the banks of the river were lined by our soldiers, who made the welkin ring with their cheers. The opening of communication with Wilmington not only brought us our mails and a supply of clothing, but enabled us to send to a place of safety thousands of refugees and contrabands who were following the army and seriously embarrass-

* After General Hood had been driven from Tennessee, General Schofield was ordered to bring the Twenty-third Corps, General Cox, to Washington, whence it was sent to Fort Fisher, N. C., which had been captured by General A. H. Terry's Tenth Corps, in coöperation with Admiral Porter's fleet, on January 15th, 1865. Schofield assumed command of both corps, and captured Wilmington, February 22d. Thence Cox was sent to Newbern, while the greater part of Schofield's forces advanced to Goldsboro'. — EDITOR.

CROSSING A BURNING BRIDGE AT JUNIPER CREEK, MARCH 9TH, 1865. (FAC-SIMILE OF A SKETCH MADE AT THE TIME.)

ing it. We were dependent upon the country for our supplies of food and forage, and every one not connected with the army was a source of weakness to us. On several occasions on the march from Atlanta we had been compelled to drive thousands of colored people back, not from lack of sympathy with them, but simply as a matter of safety to the army. The refugee-train following in rear of the army was one of the most singular features of the march. Long before the war, the slaves of the South had a system of communication by which important information was transmitted from one section of the country to another. The first gun at Sumter announced to every slave of the South that a great struggle had commenced in the result of which his own fate was in some degree at stake. The advance of Sherman's army through a section never before visited by a Union soldier was known far and near many miles in advance of us. It was natural that these poor creatures, seeking a place of safety, should flee to the army, and endeavor to keep in sight of it. Every day as we marched on, we could see, on each side of our line of march, crowds of these people coming to us through roads and across the fields, bringing with them all their earthly goods, and many goods which were not theirs. Horses, mules,

cows, dogs, old family carriages, carts, and whatever they thought might be of use to them were seized upon and brought to us. They were allowed to follow in rear of our column, and at times they were almost equal in numbers to the army they were following. As singular, comical, and pitiable a spectacle was never before presented. One day a large family of slaves came through the fields to join us. The head of the family, a venerable negro, was mounted on a mule, and safely stowed away behind him in pockets or bags attached to the blanket which covered the mule were two little pickaninnies, one on each side. This gave rise to a most important invention, *i. e.*, "the best way of transporting pickaninnies." On the next day a mule appeared in column, covered by a blanket with two pockets on each side, each containing a little negro. Very soon old tent-flies or strong canvas was used instead of the blanket, and often ten or fifteen pockets were attached to each side, so that nothing of the mule was visible except the head, tail, and feet, all else being covered by the black woolly heads and bright shining eyes of the little darkies. Occasionally a cow was made to take the place of the mule; this was a decided improvement, as the cow furnished rations as well as transportation for the

babies. Old stages, family carriages, lumber, wagons and carts filled with bedding, cooking utensils and "traps" of all kinds, with men, women, and children loaded with bundles, made up the balance of the refugee-train which followed in our rear. As all the bridges were burned in front of us, our pontoon trains were in constant use, and the bridges could be left but a short time for the use of the refugees. A scramble for precedence in crossing the bridge always ensued. The firing of a musket or pistol in rear would bring to the refugees visions of guerrillas, and then came a panic. As our bridges were not supplied with guard-rails, occasionally a mule would be crowded off and with its precious load would float down the river.

Having thoroughly destroyed the arsenal buildings, machine shops, and foundries at Fayetteville, we crossed the Cape Fear River on the 13th and 14th and resumed our march. We were now entering upon the last stage of the great march which was to unite the Army of the West with that of the East in front of Richmond. If this march could be successfully accomplished the Confederacy was doomed. General Sherman did not hope or expect to accomplish it without a struggle. He anticipated an attack and made provision for it. He ordered me to send all my baggage trains under a strong escort by an interior road on my

right, and to keep at least four divisions with all their artillery on my left, ready at all times for an attack.

During the 15th of March, Hardee was retreating before us, having for his rear-guard a brigade composed of the troops which had garrisoned Charleston, commanded by General Alfred Rhett. Kilpatrick's cavalry was in advance of the left wing, and during the day some of the skirmishers had come suddenly upon General Rhett, accompanied by a few of his men, and had captured him. Rhett before the war had been one of the editors of the Charleston "Mercury," one of the strongest secession papers of the South. He was sent by Kilpatrick to General Sherman. Sherman while stationed in Charleston before the war had been acquainted with Rhett, and not wishing to have him under his immediate charge, he sent him to me. Rhett spent that night in my tent, and as I had also been stationed at Fort Moultrie in 1854 and '55, and had often met him, we had a long chat over old times and about common acquaintances in Charleston. The following morning Rhett was sent to the rear in charge of the cavalry. He was handsomely dressed in the Confederate uniform, with a pair of high boots beautifully stitched. He was deeply mortified at having been "gobbled up" without a chance to fight. One of my staff told me that he saw Rhett a few

days later, trudging along under guard, but the beautiful boots were missing,—a soldier had exchanged a very coarse pair of army shoes for them. Rhett said that in all his troubles he had one consolation, that of knowing that no one of Sherman's men could get on those boots.

FIGURE 1. MEN DURING THE MARCH OUT OF FAYETTEVILLE. (FROM A SKETCH MADE AT THE TIME.)

THE FOURTEENTH CORPS ENTERING FAYETTEVILLE. (FROM A SKETCH MADE AT THE TIME.)

On the following morning Kilpatrick came upon the enemy behind a line of intrenchments. He moved his cavalry to the right, and Jackson's and Ward's divisions of the Twentieth Corps were deployed in front of the enemy's line. General Sherman directed me to send a brigade to the left in order to get in rear of the intrenchments, which was done, and resulted in the retreat of the enemy and in the capture of Macbeth's Charleston Battery and 217 of Rhett's men. The Confederates were found behind another line of works a short distance in rear of the first, and we went into camp in their immediate front. During the night Hardee retreated, leaving 108 dead for us to bury, and 68 wounded. We lost 12 officers and 65 men killed and 477 men wounded. This skirmish was known as the battle of Averysboro'.

Our march to this point had been toward Raleigh. We now took the road leading to Goldsboro'. General Sherman rode with me on the 18th and left me at 6 A. M. on the 19th to join General Howard, who was marching on roads several miles to our right. On leaving me General Sherman expressed the opinion that Hardee had fallen back to Raleigh, and that I could easily reach the Neuse

River on the following day. I felt confident I could accomplish the task. We moved forward at 6 A. M., and soon met the skirmishers of the enemy. The resistance to our advance became very stubborn. Carlin's division was deployed and ordered to advance. I believed that the

LIEUTENANT-GENERAL WADE HAMPTON, C. S. A., COMMANDING THE CAVALRY OF JOHNSTON'S ARMY. (FROM A PHOTOGRAPH.)

force in my front consisted only of cavalry with a few pieces of artillery. Fearing that the firing would be heard by General Sherman and cause the other wing of the army to delay its march, I sent Major F. W. Gundon of my staff to General Sherman, to tell him that I had met a strong force of cavalry, but that I should not need assistance, and felt confident I should be at the Neuse at the appointed time. Soon after the bearer of the message to General Sherman had left me, word came from Carlin that he had developed a strong force of the enemy in an intrenched position.

pany and regiment. While I was talking with him one of my aides, Major William G. Tracy, rode up and at once recognized the deserter as an old acquaintance, whom he had known at Syracuse before the war. I asked how he knew General Johnston was in command and what he knew as to the strength of his force. He said General Johnston rode along the line early that morning, and that the officers had told all the men that "Old Joe" had caught one of Sherman's wings beyond the reach of support, that he intended to *smash* that wing and then go for the other. The man stated

CONFEDERATES IN THE WAKE OF SHERMAN'S ARMY

About the same time one of my officers brought to me an emaciated, sickly-appearing young man about twenty-two or twenty-three years of age, dressed in the Confederate gray. He had expressed great anxiety to see the commanding officer at once. I asked him what he had to say. He said he had been in the Union army, had been taken prisoner, and while sick and in prison had been induced to enlist in the Confederate service. He said he had enlisted with the intention of deserting when a good opportunity presented itself, believing he should die if he remained in prison. In reply to my questions he informed me that he formerly resided at Syracuse, New York, and had entered the service at the commencement of the war, in a company raised by Captain Butler. I had been a resident of Syracuse and knew the history of his com-

pany and regiment. While I was talking with him one of my aides, Major William G. Tracy, rode up and at once recognized the deserter as an old acquaintance, whom he had known at Syracuse before the war. I asked how he knew General Johnston was in command and what he knew as to the strength of his force. He said General Johnston rode along the line early that morning, and that the officers had told all the men that "Old Joe" had caught one of Sherman's wings beyond the reach of support, that he intended to *smash* that wing and then go for the other. The man stated

that he had no chance of escaping till that morning, and had come to me to warn me of my danger. He said, "There is a very large force immediately in your front, all under command of General Joe Johnston." While he was making his statement General Carlin's division with four pieces of artillery became engaged with the enemy. A line for defense was at once selected, and as the troops came up they were placed in position and ordered to collect fence rails and everything else available for barricades. The men used their tin cups and hands as shovels and needed no urging to induce them to work. I regretted that I had sent the message to General Sherman assuring him I needed no help, and saw the necessity of giving him information at once as to the situation. This information was carried to General Sherman by a young man, not then twenty years of

MAJOR-GENERAL R. F. HOKE, C. S. A., COMMANDING A DIVISION IN HARDEE'S CORPS. (FROM A PHOTOGRAPH.)

age, but who was full of energy and activity and was always reliable. He was then the youngest member of my staff. He is now governor of Ohio—Joseph B. Foraker. His work on this day secured his promotion to the rank of captain. Some years after the close of the war Foraker wrote to me calling my attention to some errors in a published account of this battle of Bentonville, and although his letter was private, his statements are so full of interest that I feel certain I shall be pardoned for giving an extract from it :

"Firing between the men on the skirmish line commenced before Sherman had left us on the morning of the 19th, but it was supposed there was nothing but cavalry in our front. It was kept up steadily, and constantly increased in volume. Finally there was a halt in the column. You expressed some anxiety, and Major W. G. Tracy and I rode to the front to see what was going on. At the edge of open fields next to the woods in which the barricades were we found our skirmish line halted. . . . In a few minutes it moved forward again. The enemy partly reserved their fire until it got half-way or more across the field. This induced Tracy and me to think there was but little danger, and so we followed up closely, until suddenly they began again a very spirited firing in the midst of which we were sorry to find ourselves. I remember we hardly knew what to do—we could do no good by going on and none by remaining. To be killed under such circumstances would look like a waste of raw material, we thought. But the trouble was to get out. We didn't want to turn back, as we thought that would not look well. While we were thus hesitating a spent ball struck Tracy on the leg, giving him a slight but painful wound. Almost at the same moment our skirmishers charged and drove the rebels. . . . I rode back with Tracy only a very short distance, when we

met you hurrying to the front. I found you had already been informed of what had been discovered and that you had already sent orders to everybody to hurry to the front. I remember, too, that a little later Major Mosely, I think, though it may have been some other member of your staff, suggested that you ought to have the advance division charge and drive them out of the way; that it could not be possible that there was much force ahead of us, and that if we waited for the others to come up we should lose a whole day, and if it should turn out that there was nothing to justify such caution, it would look bad for the left wing; to which you replied in an earnest manner, 'I can afford to be charged with being dilatory or over-cautious, but I cannot afford the responsibility of another Ball's Bluff affair.' Do you remember it? I presume not, but I was then quite young, and such remarks made a lasting impression. It excited my confidence and admiration, and was the first moment that I began to feel that there was really serious work before us. . . . You handed me a written message to take to General Sherman. The last words you spoke to me as I started were, 'Ride well to the right so as to keep clear of the enemy's left flank, and *don't spare horse-flesh.*' I reached General Sherman just about sundown. He was on the left side of the road on a sloping hillside, where, as I understood, he had halted only a few minutes before for the night. His staff were about him. I think General Howard was there, but I do not now remember seeing him,—but on the hillside twenty yards farther up Logan was lying on a blanket. Sherman saw me approaching and walked briskly towards me, took your message, tore it open, read it, and called out, 'John Logan! where is Logan?' Just then Logan jumped up and started towards us. He too walked briskly, but before he had reached us Sherman had informed him of the situation and ordered him to turn Hazen back and have him report to you. It was not yet dark when I rode away carrying an answer to your message. It was after midnight when I got back, the ride back being so much longer in point of time because the road was full of troops, it was dark, and my 'horse-flesh' was used up."

General Carlin's division of the Fourteenth Corps had the advance, and as the enemy exhibited more than usual strength, he had deployed his division and advanced to develop the position of the enemy. Morgan's division of the same corps had been deployed on Carlin's right. Colonel H. G. Litchfield, inspector-general of the corps, had accompanied these troops. I was consulting with General Jeff. C. Davis, who commanded the Fourteenth Corps, when Colonel Litchfield rode up, and in reply to my inquiry as to what he had found in front he said, "Well, General, I have found something more than Dibrell's cavalry—I find infantry intrenched along our whole front and enough of them to give us all the amusement we shall want for the rest of the day."

Foraker had not been gone half an hour when the enemy advanced in force, compelling Carlin's division to fall back. They were handled with skill and fell back without panic or demoralization, taking places in the line established. The Twentieth Corps held the left of our line with orders to connect with the Fourteenth. A space between the two corps had been left uncovered, and Cogswell's

brigade of the Twentieth Corps, ordered to report to General Davis, filled the gap just before the enemy reached our line.

The enemy fought bravely, but their line had become somewhat broken in advancing through the woods, and when they came up to our line, posted behind slight intrenchments, they received a fire which compelled them to fall back. The assaults were repeated over and over again until a late hour, each assault finding us better prepared for resistance. During the night Hazen reported to me and was placed on the right of the Fourteenth Corps. Early on the next morning Generals Baird and Geary, each with two brigades, arrived on the field. Baird was placed in front of our works and moved out beyond the advanced position held by us on the preceding day. The 20th was spent in strengthening our position and developing the line of the enemy. On the morning of the 21st the right wing arrived. This wing had marched

twenty miles over bad roads, skirmishing most of the way with the enemy. On the 21st General Johnston found Sherman's army united, and in position on three sides of him. On the other was Mill Creek. Our troops were pressed closely to the works of the enemy, and the entire day was spent in skirmishing. During the night of the 21st the enemy crossed Mill Creek and retreated towards Raleigh. I have not attempted to give such a description of the battle as its importance would justify. The plans of the enemy to surprise us and destroy our army in detail were well formed and well executed, and would have been more successful had not the men of the Fourteenth and Twentieth Corps been veterans who had passed the days when they were liable to become panic-stricken. They were soldiers who had passed through many hard-fought battles and were the equals in courage and endurance of any soldiers of this or any other country.

H. W. Slocum.

BENTONVILLE. THE MORNING AFTER THE BATTLE—THE SMOKE IS FROM RESIN THAT WAS FIRED BY THE CONFEDERATES. FROM A SKETCH MADE AT THE TIME.

THE BATTLE OF BENTONVILLE.

THE battle of Bentonville was in many particulars one of the most remarkable which occurred during the late Civil War, and though the report of this fight made by the commander of the Confederate forces, General Joseph E. Johnston, is clear and accurate, there may be some minor details which would be of interest to the general reader, as throwing light on this battle, which was the last important one of the war. When the disparity of the numbers engaged is taken into consideration, it must be regarded also as one of the most brilliant, and its conduct and its results added luster to the fame of the great soldier who commanded the Southern troops. In order to have a clear conception of this battle, the reader should understand the con-

dition of affairs in the South at the time it occurred and just previous to it. A few words on this point are also necessary, to give the reasons which induced General Johnston to deliver battle.

When Sherman cut loose from Atlanta, after expelling the inhabitants and burning a part of the city, it was evident to every one who had given a thought to the subject, that his objective point was a junction with General Grant's army. The Army of Tennessee, after its disastrous repulse before Franklin, was, with its shattered columns, in rear of instead of in front of Sherman's advancing forces, and thus he was allowed to make his march to Savannah a mere holiday excursion. At this latter point there was no adequate force to oppose him, and

MAJOR-GENERAL LAFAYETTE MCLAWS, C. S. A., COMMANDING A DIVISION IN HARDEE'S CORPS. (FROM A PHOTOGRAPH.)

when Hardee, who commanded there, withdrew, the city fell an easy prey. The situation then was as follows: Sherman had established a new base, where communication with the sea was open to him, while Hardee's line extended from the Savannah River to James Island, beyond Charleston, a distance of 115 miles. Outside of the garrison of Charleston, he had but a handful of unorganized troops to hold this long line, and our true policy then was to abandon Charleston, to concentrate every available man in front of Sherman, and to dispute the passage of the rivers and swamps which were in his line of march, and which offered most admirable positions for an inferior force to strike a superior one. The garrison of Charleston consisted, I think, of about 16,000 well-equipped, well-drilled infantry, fully supplied with excellent artillery. Stevenson's division, Army of Tennessee, consisting of 2600 men, reached Columbia before the appearance of the enemy. In addition to the troops already mentioned, there were here Wheeler's and Butler's commands of cavalry and several unattached bodies of State troops and reserves. A rapid concentration of these

forces would have put from 25,000 to 30,000 men in front of Sherman, and an attack upon one wing of his army, when separated from the other, would either have resulted in a victory to our army or would have encumbered him with so many wounded men that he would have been forced to retreat to the sea, at Charleston. The views I have here expressed were entertained at the time spoken of, for as I happened to be in Columbia then, not on duty, however, I urged upon General Beauregard, who had assumed command about that time, the abandonment of Charleston and the concentration of his whole force at the first-named city. I pressed the same views on Governor Magrath, telling him that as important as Charleston was to us, Branchville, the junction of the railroads from Columbia, Augusta, and Charleston, was far more important. In these opinions, my recollection is that General Beauregard concurred, but why the

movements suggested were not made I have never known. At all events Charleston was evacuated, and its garrison was sent to Cheraw on the Pedee River, and thence by a long march to North Carolina. When the Federal army appeared before Columbia, the only troops in and around the city were Stevenson's division, Wheeler's cavalry, and a portion of Butler's division, in all about five thousand of all arms. Practically there was no force in the city, for the troops were on picket duty from a point three miles above Columbia, to one twenty miles below. Of course no defense of the place was attempted, and it was surrendered by the mayor before the enemy entered it, with the hope that, as no resistance had been offered, it would be protected from pillage and destruction.

It is not my purpose here to speak of the fate that befell it: Sherman, in his memoirs, tells what it was in these brief and suggestive words, "The army, having totally ruined Columbia, moved on towards Winnsboro'." Stevenson's division, which was above the city, was withdrawn, taking the road to Winnsboro', and I having been assigned the night previous

to the command of the cavalry, fell back in the same direction, covering the retreat of the infantry. These details, which have taken greater space than was anticipated, are given so as to present clearly the positions, numbers, and condition of our forces at the beginning of the campaign in the Carolinas. It will be seen, from what has been said, that it would scarcely have been possible to disperse a force more effectually than was done in our case. Circumstances may have caused this, but the fact was patent. Hardee was moving towards Fayetteville in North Carolina; Beauregard was directing Stevenson's march to Charlotte; Cheatham, with his division from the Army of Tennessee, had come from Augusta and was moving towards the same point as Stevenson, but on the west side of the Congaree and Broad rivers, and the cavalry kept in close observation of the enemy. Hardee's men, though good soldiers, had been kept so long on garrison duty that the long marches broke down many of them, and half of his command, or perhaps more, fell out of the ranks while going to the scene of action. It was from these widely separated forces, these *disjuncta membra*, that General Johnston, who was assigned to the command of this department, February 23d, had to form the army with which he fought the battle of Bentonville, and his first task was to bring together these detached bodies of troops. Hoke's fine division from the Army of Northern Virginia also joined him before the fight, and rendered gallant and efficient service. General Johnston had united all his available infantry at Smithfield, North Carolina, and Sherman, whose progress had been entirely unobstructed, except by a spirited fight made by Hardee at Averysboro', and some affairs with our cavalry, was moving east from Fayetteville towards Goldsboro'. This being the condition of affairs, General Johnston realized that unless the advance of the enemy could be checked it would be only a question of time before Sherman would effect a junction with Grant, when their united armies would overwhelm the depleted and exhausted Army of Northern Virginia. Under these circumstances, but two alternatives were presented to the Confederate general: one was to transport his infantry by rail rapidly to Virginia, where the reinforcements he could thus bring to General Lee might enable these two great soldiers to strike a decisive blow on Grant's left flank. The other was to throw his small force on the army confronting him, with the hope of crippling that army, if he could not defeat it. As we could hope for no reinforcements from Virginia, or indeed from any quarter, my judgment was that the first-named plan held out the best promise of success, and

if my memory serves me right, I think that General Johnston mentions in his "Narrative" that he suggested it. Of this, however, I am not certain, and I cannot verify my impression, as his report is not within my reach. However the case may be, that plan was not adopted, and the general determined to resort to the other. His determination was a bold, I think a wise one; for, great as was the risk involved, it offered the only hope of success left to us. The relative position of the opposing armies being then as it has been described, the Confederate cavalry bivouacking about two miles south of the little hamlet of Bentonville, where the road from Smithfield intersected that from Fayetteville to Goldsboro', I received a dispatch from General Johnston about 12 o'clock on the night of March 17th. In this letter he asked if I could give him information as to the positions of the several corps of the Federal army; what I thought of the practicability of his attacking them; if advisable in my opinion to do so; when and where an attack could be made to most advantage; and requesting me to "give him my views." He was then, as I have said, at Smithfield, about 16 miles from Bentonville, and I replied at once, telling him that the Fourteenth Corps was in my immediate front; the Twentieth Corps was on the same road, five or six miles in the rear; while the other two corps were on a road some miles to the south, which ran parallel to the one on which we were. I suggested that the point at which I was camped was an admirable one for the attack he contemplated, and that I would delay the advance of the enemy as much as possible so as to enable our troops to concentrate there.

In a few hours a reply came from General Johnston saying that he would move at once to the position indicated, and directing me to hold it if possible. In obedience to these orders, I moved out on the morning of the 18th to meet the enemy, with whom we skirmished until the afternoon, when I was pressed back by the force of numbers to the crest of a wooded hill, which overlooked a very large field that I had selected as the proper place for the battle, which was to take place as soon as our infantry reached the ground. It was vitally important that this position should be held by us during the night, so I dismounted all my men, placing them along the edge of the woods, and at great risk of losing my guns I put my artillery some distance to the right of the road, where, though exposed, it had a commanding position. I knew that if a serious attack was made on me the guns would be lost, but I determined to run this risk in the hope of checking the Federal advance.

As an illustration of the quick perception of our private soldiers, I recall an expression of one of them, as I rode off after placing the guns in position. Turning to some of his comrades he said with a laugh, "Old Hampton is playing a bluff game, and if he don't mind Sherman will call him." He evidently understood the game of war as well as that of poker! It was nearly sunset when the enemy moved on this position, and recognizing its strength, not knowing also, I suppose, what number of troops held it, they withdrew after a rather feeble demonstration against us. We were thus left in possession of the ground chosen for the fight which we expected the next day. That night General Johnston reached Bentonville, as did a part of his command, but Hardee's troops had not been able to form a junction with the rest of our forces as the distance they had to march was greater than had been anticipated. As soon as General Johnston had established his headquarters at Bentonville, I reported to him, giving him all the information in my possession as to the position of the enemy, and the character of the ground on which we had to operate. The following extracts from the report of the general will show the nature of our conference:

"Lieutenant-General Hampton gave all necessary information that night, at Bentonville. He described the ground near the road abreast of us as favorable for our purpose. The Federal camp, however, was but five or six miles from that ground, nearer, by several miles, than Hardee's bivouac, and therefore we could not hope for the advantage of attacking the head of a deep column. . . . As soon as General Hardee's troops reached Bentonville next morning, we moved by the left flank, Hoke's division leading, to the ground selected by General Hampton, and adopted from his description."

As the general had not been able to examine the ground, I ventured to suggest such disposition of our forces as I thought would be most advantageous, and my suggestions were adopted. The plan proposed was that the cavalry should move out at daylight and occupy the position held by them on the previous evening. The infantry could then be deployed, with one corps across the main road and the other two obliquely in echelon to the right of the first. As soon as these positions were occupied, I was to fall back, with my command, through the first corps, and passing to the rear of the infantry line, I was to take position on our extreme right. These movements were carried out successfully, except that Hardee had not reached his position in the center when the enemy who were following me struck Bragg's corps, which was in line of battle across the road. This absence of Hardee left a gap between Bragg and Stewart; and in order to hold this gap until the arrival of Hardee, I had two batteries of horse artil-

lery—Captains Halsey and Earle—placed in the vacant space. The former of these batteries had constituted a part of the Hampton Legion; it served with me during all the campaigns in Virginia, making an honorable and brilliant record, and it joined me at Bentonville, just in time to render efficient service in the last battle in which we fought together. All the guns of both batteries were admirably served, and their fire held the enemy in their front until Hardee reached his allotted position. In the meantime Bragg's troops had repulsed the attack made on them, and the opportune moment had arrived when the other two corps, in accordance with the plan agreed on, should have been thrown on the flank of the retreating enemy. But unfortunately there occurred one of those incidents which so often change the fate of battles, and which broke in on the plan of this fight just at the crisis of the engagement. About the time that the head of Hardee's column appeared a very heavy attack was made on Hoke's division, and Bragg, fearing that he could not maintain his ground, applied for reinforcements. General Johnston at once determined to comply with this request, and he directed Hardee to send a portion of his force to the support of Hoke. This movement was in my judgment the only mistake committed on our part during the fight, and when the general notified me of the intended change in the plans, I advised that we should adhere to the one agreed on. It would be great presumption in me to criticise any movement directed by General Johnston, in whose skill and generalship I have always entertained implicit confidence, and I should not now venture to express an opinion as to the propriety of the order given to Hardee had not the general in his report stated that this movement was a mistake. In reference to it, he uses the following language in his "Narrative":

"The enemy attacked Hoke's division vigorously, especially its left, so vigorously that General Bragg apprehended that Hoke, although slightly entrenched, would be driven from his position. He therefore applied urgently for strong reinforcements. Lieutenant-General Hardee, the head of whose column was then near, was directed most injudiciously to send his leading division, McLaws's, to the assistance of the troops assailed," etc.

General Johnston evidently became satisfied, in the progress of the fight, that this movement was "most injudicious," for it became apparent that it was unnecessary, as Hoke repulsed the attack made on him fully and handsomely. Had Hardee been in the position originally assigned him at the time Hoke struck the enemy, and could his command and Stewart's have been thrown on the flanks of the retreating Federal forces, I think that the

Fourteenth Corps would have been driven back in disorder on the Twentieth, which was moving up to its support. This, however, is but speculation, and I refer to it only as presenting an interesting problem to the military student. Had these two corps been driven back to the west with loss, while the right wing of the Federal army was moving rapidly to the east on another road, all the subsequent operations of the campaign might have been changed. But "facts are stubborn things," and we are dealing now, as then, with them. And the fact that confronted General Johnston then was that much precious time had been lost by a delay in following up promptly the success gained by his troops in their first conflict with the enemy. His orders were that Bragg should change front to the left, which movement would have aligned him with the other corps and enabled him to attack on the flank. For some reason, not known to me, these orders were not carried out promptly, or perhaps not at all, and hence delay occurred which, while hurtful to us, was of infinite value to the enemy, for time was given to him to bring up the Twentieth Corps to the support of the broken ranks of the Fourteenth. It thus happened that though the attack of the Fourteenth Corps was repulsed early in the morning, our counter-attack was delayed until quite late in the afternoon, when we encountered a force double that met in the morning, and we found them behind breastworks. The fighting that evening was close and bloody. As General Johnston has described it far better than I could do, I quote his account:

"The Confederates passed over three hundred yards of the space between the two lines in quick time and in excellent order, and the remaining distance in double-quick, without pausing to fire until their near approach had driven the enemy from the shelter of their breastworks, in full retreat, to their second line. After firing a few rounds, the Confederates again moved forward, and when they were near the second line, they were met by both lines of Federal troops, I think by General Hoke, after commanding the double-quick, led the charge, and with his knightly gallantry dashed over the enemy's breastworks on the right, in front of his men. Some distance in the rear there was a very thick wood of young pines into which the Federal troops were pursued, and in which they rallied and renewed the fight. But the Confederates continued to advance, driving the enemy back slowly, notwithstanding the advantage given to the party on the defensive by the forest, which made pursuit rather by the enemy's impulse. On the extreme left, however, General Bragg's troops were held in check by the Federal right, which had the aid of breastworks and the thicket of black-jack. . . . Four pieces of artillery were taken, but as we had only spare horses enough to draw off three, one was left in the field. The impossibility of concentrating our Confederate forces in time to attack the Federal left wing, while in column on the march, made complete success also impossible, from the enemy's great numerical superiority."

Night closed upon a hard-fought field and a dearly won victory, for the losses in our handful of troops had been heavy. After dark General Johnston withdrew to the position from which he had moved to the attack, and our first line with slight modifications was resumed. No disturbance occurred that night, but early on the morning of the 20th, Brigadier-General Law, whom I had placed temporarily in command of Butler's division in the unavoidable absence of that gallant and distinguished officer, who had won his way from the rank of captain to that of major-general under my command, reported that the right wing of the Federal army, which had struck the road on which we were some miles to the east, was rapidly moving down on our rear and left flank. Hoke then held our left, and General Johnston directed him to refuse his left flank so that he could meet the attack of the approaching force. I prolonged the rear line taken by Hoke by placing Butler's and Wheeler's commands on his left, and while doing this we met and checked a sharp attack. Sherman thus had his whole army united in front of us, about 12 o'clock on the 20th, and he made repeated attacks during the day, mainly on Hoke's division. In all of them he was repulsed, and many of his wounded left in front of our lines were carried to our hospitals. Our line was a very weak one, and our position was extremely perilous, for our small force was confronted, almost surrounded, by one nearly five times as large. Our flanks rested on no natural defenses, and behind us was a deep and rapid stream over which there was but one bridge, which gave the only means of withdrawal. Our left flank — far overlapped by the enemy — was held along a small stream, which flowed into Mill Creek, and this was held only by cavalry videttes stationed at long intervals apart. On the 21st there was active skirmishing on the left of our line, and my pickets reported that the enemy seemed to be moving in force to our left on the opposite side of the small stream, along which my videttes were stationed. I immediately rode down to report this fact to General Johnston, and I told him that there was no force present able to resist an attack, and that if the enemy broke through at that point which was near the bridge across the main stream our only line of retreat would be cut off. The general directed me to return to the point indicated to ascertain the exact condition of affairs, and as I was riding back I met a courier, who informed me that the enemy in force had crossed the branch, had driven back the cavalry pickets, and were then very near the main road which led to the bridge. This attack rendered our position extremely dangerous, for if the

attacking force had been able to attain possession of the road we could not have withdrawn without very heavy loss, if we could have done so at all. Just before the courier who brought me the information of the advance of the army met me, I had passed a brigade, though its numbers were not more than sufficient to constitute a regiment, moving towards our left.* This was Cumming's Georgia brigade, commanded then, I think, by Colonel Henderson, and I doubt if there were more than two hundred to two hundred and fifty in the command.

Realizing the importance of prompt action, I ordered this command to move at once to the point threatened, and I also ordered up a battery which I had passed. I then sent a courier to bring up all the mounted men he could find, and in a few minutes a portion of the 8th Texas Cavalry—60 or 80 men—responded to my call. All of these troops were hurried up to meet the enemy, who were then within a few hundred yards of the road, and just as I had put them in position General Hardee arrived on the ground. Explaining the position to him and telling him of the dispositions I had made, he at once ordered a charge and our small force was hurled against the advancing enemy. The attack was so sudden and so impetuous that it carried everything before it, and the enemy retreated hastily across the branch. This attack on our position was made by Mower's division, and it was repulsed by a force which certainly did not exceed, if it reached, three hundred men. Sherman in his "Memoirs" says that he "ordered Mower back"; but if this statement is true, the order was obeyed with wonderful promptness and alacrity. General Hardee, who assumed command when he reached the field, led this charge with his usual conspicuous gallantry; and as he returned from it successful, his face bright with the light of battle, he turned to me and exclaimed: "That was Nip and Tuck, and for a time I thought Tuck had it." A sad incident marred his triumph, for his only son, a gallant boy of sixteen, who had joined the 8th Texas Cavalry two hours before, fell in the charge led by his father. This affair practically ended the battle of Bentonville for that night. General Johnston withdrew his command safely across Mill Creek, where he camped two miles beyond the bridge. On the morning of the 22d there was a sharp skirmish at the bridge between some of Wheeler's cavalry and the advance-guard of the enemy, who tried to force a passage, but who were handsomely repulsed with some loss. I have not specified the services of the cavalry during the operations described, but they were important and were gallantly performed. The commands of Butler and

Wheeler numbered, I think, about three thousand men, and after the engagement became general nearly all of this force fought alongside of the infantry in their improvised breastworks. When Sherman moved up on our left flank, they checked his advance until our main line could be refused on the left wing, and in Mower's subsequent repulse they bore an important part, for, in addition to the gallant charge of the 8th Texas made in conjunction with the infantry, other portions of my command struck his flank as he was retreating, and contributed largely to our success. As, however, I am not attempting to write a report of this battle, but simply to give a brief sketch of its main incidents, I have not alluded to the conduct of any of the troops engaged. I proposed merely to give my reminiscences and impressions of an engagement which is memorable as the last general battle of the Civil War, and which, in my judgment, was one of the most extraordinary. Let me give my reasons briefly for this opinion. The infantry forces of General Johnston amounted to about 14,100 men, and they were composed of three separate commands which had never acted together. These were Hardee's troops, brought from Savannah and Charleston; Stewart's, from the Army of Tennessee; and Hoke's division of veterans, many of whom had served in the campaigns of Virginia. Bragg, by reason of his rank, was in command of this latter force, but it was really Hoke's division, and he directed the fighting. These troops, concentrated only recently for the first time, were stationed at and near Smithfield, eighteen miles from the field where the battle was fought, and it was from these points that General Johnston moved them, to strike a veteran army numbering about 60,000 men. This latter army had marched from Atlanta to Savannah without meeting any force to dispute its passage, and from the latter city to Bentonville unobstructed save by the useless and costly affair at Averysboro', where Hardee made a gallant stand, though at a heavy loss. No bolder movement was conceived during the war than this of General Johnston, when he threw his handful of men on the overwhelming force in front of him, and no more gallant defense was ever made than his, when he confronted and baffled this force, holding a weak line for three days against nearly five times his number. For the last two days of this fight he only held his position to secure the removal of his wounded, and when he had accomplished that he withdrew leisurely, moving in his first march only about four miles. All the Federal wounded who fell into his hands were cared for in his field-hospitals, when all of his, who could not be removed, were left. Of course General John-

ston's only object in making this fight was to cripple the enemy, and to impede his advance. And I think that if his original plan of battle could have been carried out, and if his orders had been executed promptly, he would have inflicted a very heavy, if not an irretrievable, disaster on the Fourteenth and the Twentieth corps. These two corps were opposed to him in the first day's fight, and in that of the last two days he was confronted by the whole of Sherman's army. It must be remembered, too, that General Schofield was in supporting distance of Sherman with 26,000 men. Few soldiers would have adopted the bold measure resorted to by General Johnston, and none could have carried it out more skillfully nor more successfully than he did. I believed during that fight, and my opinion has never changed, that if he could have had his plans executed promptly he would have gained one of the most brilliant victories of the war, and even under all the difficulties that confronted him he achieved a wonderful success. In this connection I may recall a conversation I had with the distinguished soldier who commanded the left wing of Sherman's army, General Slocum. We met in New York in 1868, and in speaking of this battle I asked him what would have been the result in his opin-

ion had General Johnston been able to follow up his first success. His reply was in substance, for I cannot quote his exact language, that the movement might have resulted in great disaster to his command, for he had been able to get up the Twentieth Corps only in time to meet the attack made on him in the afternoon.

The unhappy war which arrayed the two sections of our country in hostile ranks is ended; the wounds left by that conflict are healing; the animosities engendered by it are dying out; the active participants in that great struggle are passing from the stage, and nothing is left to the survivors but the memory of the heroic deeds performed. It will be the task, as it will be the duty, of the future historian to sift out the truth of this great war and to put it on record. Any contribution to the history of that war cannot be without some value; and mine, brief and imperfect as I feel it to be, is offered as a small addition to the fund of knowledge which the historian will seek to acquire. All my opinions, all my conclusions, about the battle of Bentonville may be erroneous, but I have tried to narrate the facts connected with it as they struck me then and as my subsequent reflections have confirmed them.

Wade Hampton.

THE WILD RIDE.

*I hear in my heart, I hear in its ominous pulses,
All day, the commotion of sinewy, mane-tossing horses;
All night, from their cells, the importunate tramping and neighing!*

Cowards and laggards fall back; but alert to the saddle,
Straught, grim, and abreast, vault the weather-worn, galloping legion,
With a stirrup-cup each to the one gracious woman that loves him.

The road is thro' dolor and dread, over crags and morasses;
There are chaps by the way, there are things that appall or entice us:
What odds? We are knights; and our souls are but bent on the riding.

*I hear in my heart, I hear in its ominous pulses,
All day, the commotion of sinewy, mane-tossing horses;
All night, from their cells, the importunate tramping and neighing!*

We spur to a land of no name, out-racing the storm-wind;
We leap to the infinite dark, like the sparks from the anvil:
Thou leadest, O God! All's well with thy troopers that follow.

Louise Imogen Guiney.

ZWEIBAK; OR, NOTES OF A PROFESSIONAL EXILE.

. . . I HAVE been reading over the books of "Paradise Lost" which record the visit of Raphael to Eden. That was delightful conversation. There was no shame or suspicion in that society. Nothing could have been sweeter, fresher, or bolder. The voices of the participants rose in poetic speech with the glad freedom of their state of perfect innocence. How that charming woman listened with pleased and apprehensive countenance to the finest thoughts of the angelic guest, her hands all the while busy with those meaths and kernels and dulcet creams! No man could have done that. The angel must often have recalled the incidents of that visit. I can fancy him standing on some flowering declivity of the everlasting fields, his mind occupied with the recollections of his terrestrial friendship and the melancholy vicissitudes of the lives of our first parents, exclaiming, as he pored upon an amaranth:—"How dreadful that people should meet with such reverses!"—then, as a look of gentlemanly shame and regret disturbed his features, "But what could I do?"

. . . I am consoled for my difficulty in speaking German by a passage in St. Paul. St. Paul says that some are "discerners of spirits" and some "have the gift of tongues," as if these qualities were contrary and inconsistent or at any rate widely diverse. Let us hope that I am a "discerner of spirits." The late Lord Beaconsfield, who was certainly a discerner of spirits, was a bad linguist. A compatriot of his who met him at the Berlin conference said, "There's one thing British about him,—that is his French." I should think it likely that the steady, silent, oriental gaze of Lord Beaconsfield would not go along with that miscellaneous activity of mind we commonly see in a man who is good at learning languages.

. . . I have seen the opinion expressed lately, that there has been in modern times an advance in the beauty of women. Perhaps there has been, although I should doubt it. Pliny speaks of a young lady of his time in the following manner:—"The youngest daughter of my friend Fundanus is dead. I have never seen a more cheerful and more lovable girl, or one who had better deserved to have enjoyed a long, I had almost said an immortal, life! She was scarcely fourteen, and yet there was in her a wisdom far beyond her years, a matronly gravity united with girlish sweetness and virgin bashfulness. With what an endearing fondness did she hang on her father's neck!

How affectionately and modestly she used to greet us, his friends! With what a tender and deferential regard she used to treat her nurses, tutors, teachers, each in their respective offices! What an eager, industrious, intelligent reader she was! . . . O melancholy and untimely loss, too truly! She was engaged to an excellent young man." This was a long time ago. The above-mentioned theory, to the contrary, notwithstanding, one may be sure that there was something pretty about this young lady; I have no doubt she suited young Pomponius Rufus, the young man to whom she was engaged. Her face and form, at any rate, had that evanescence which of itself is pretty. The lines of her countenance, her features even, the expression of her figure, were all new. She had acquired them since the preceding year. Pliny is writing perhaps in A. D. 109. Three years earlier she was still playing with dolls. Now she has a "wisdom beyond her years," "a matronly gravity," and "a virgin bashfulness." I think there is something pretty in the fondness for study of this child of the accomplished Fundanus. She was not like one of those pert daughters of literary families that I have known, who despise books and want only to know rich and smart people and to go to balls and races. I have no doubt she had a bust of Virgil in her bedroom. She probably had a birthday-book of the poets' works and made people write their names opposite their respective quotations.

. . . *Apropos* of the daughter of Fundanus, the R——s are staying here with all their children. The youngest daughter is about fifteen. Her sisters say that she is at the awkward age. She is tall for her age, and her limbs are long. Hers may be the awkward age, but there is a grace about her awkwardness which it would have been hard for more completed beauties to match. She exhibits this in walking or standing, but especially in a sitting position, for her body then falls into indolent attitudes, which are perfect in grace. Her indisposition to break up any position into which she has fallen is not so much the result of indolence as of what I believe to be an instinct, that anything so pretty should not too soon come to an end. Her figure at such times seems to have a pleasurable consciousness of repose. Her silence is perpetual; I greatly enjoy it. This beautiful mushroom has grown to its present size since I left college.

. . . W., who has come for a fortnight to

this frivolous place, is an interesting person. He is able, learned, and virtuous, but a passionate prig. He has been all his life a professor, and has a trait often to be met with in teachers: he cannot help instructing you. It is true that his tone is one of great simplicity and modesty. But it is an enforced simplicity; you perceive in him a feeling that it is a praiseworthy thing in so wise a person to be so catholic and unpretentious. I believe that he is half-conscious of this defect, and encourages and cultivates his simplicity, but he does this to little purpose; it has become a necessity of his nature that his way of thinking shall override yours. That so great a man should be the victim of such a fault seems odd. A person of the highest culture and virtue, W. would, of course, wish his conduct to be governed by reason; but what has his pride of opinion to do with the subject he may be discussing? what has Truth to do with the matter of his being up or down, great or small?

Even when W. listens to you, it is with an air of rating or marking your observations. I have noticed this peculiarity in a number of professors. Instead of hearing the remarks of another, as a normal or healthy person would do, a professor seems to say: "I should rate that observation at 7.60"; or, "That is an excellent opinion: I should put that at 9.15."

But I think that W.'s chief misfortune is that he does not see and take note of other people. He knows Sanscrit and chemistry, political economy and history; but when he meets men and women, his eyes discharge blank cartridges at them. When a human being is to be perceived, he is helpless.

Some Frenchman said of Gibbon, who was short and very fat, that when he

wanted exercise it was his habit to take *trois fois le tour de Monsieur Gibbon*. Literary fame is very wonderful. Is it not remarkable that such a book as "The Decline and Fall of the Roman Empire" should be the production of anything so temporary and ephemeral as a man; that there should arise from the little heap of corruption and gray hairs consigned to the grave such a monument!

Every one must have noticed how the parlor ornaments, the vases, and the candlesticks remain after the departure of fathers and brothers. A book has the same indestructibility. It cannot catch cold. This is true not only of the works of a Gibbon, a Johnson, or a Sterne; but you and I who can write a nice little book are not to be despised; we may be at least as immortal as an andiron.

. . . I have said that I come to Zweibak to see my compatriots. How fortunate I should be if I could live in the United States, which is a country full of Americans!

I have been too long away from that country. I am devoted to it. Indeed, I may say that I care for little else. I am fond of its people. I am proud of its history, its humor, its size, and its climates. Thy drastic sun, thy silent wildernesses, whose briers wound my fancy as I remember them, thy railroad depots in the lonely clearings on the edge of the forest, where the shunted cars bake in the sunlight, are always present with me. I am always thinking of these things. Would it not be well to return and give one's self to some such practical work as mind and body crave, and to spend one's hours of relaxation in friendly society with that pure and savage spirit which pervades our scenery.

E. S. Nadal.

THE ANGEL OF SLEEP.

DEAR angel Sleep,
Where lies thy world which yet hath not been seen
By waking eyes, though they be charged with light
Flicked from the undying sun, and pierce the night
With eagle gaze? The veil doth intervene
Which hides thy mystic land. Thy noiseless wings
Afar up-bear thee on thy distant flight
While watch we keep.
Still doth thy hand withhold, thy lips forbid,
The strange half-parting into bliss which brings
Some touch of solace craved by every breast,
Till softly to the cheek the fringed lid
By weariness or sorrow hath been pressed
And all — save life within the heart — at rest.

Then from the airy corridors which wed
 The shadowed halls where Death and Silence dwell,
 With velvet foot-falls on the lonely floors,
 Through closely bolted and unfriendly doors,
 Thou — friend of friendless souls — with hastening tread
 Dost come to kneel — by cot and costly bed ;
 With juice of herbs from many a dream-land dell
 Caught up and pressed betwixt thy soothing palms
 To cool the eyes that weeping hath made red,
 And plants, plucked from the fragrant earth, which shed
 Their priceless drops for thee, and poppy balms
 That breathe elysian airs, whose touch restores
 Lost happier visions of sweet days, long dead,
 To hungering hearts that feed on sorrow's bread.

Across the deep
 Unguessed abysses of ethereal space
 Bridged by wide arches of the glimmering stars,
 Through darkling distances — on wind-reaped moors —
 Beside dim rivers on whose soundless shores
 The countless journeying years have left no trace
 To tell Time had been there, thy friendly hand
 Leads forth our spirits to that shrouded land
 Beyond the vague impenetrable bars
 Which hedge this conscious life — a world that beams
 With other light than this — in which the soul
 'Scapes for a little from the harsh control
 Of tyrant circumstance, and oft it seems
 We almost have cast off our chains and stand
 Freed from the reach of care and earthly dole,
 So far we wander in thy land of dreams.

But while life bides, the binding tie must hold.
 We must return to earth. Tears that were shed
 Before thine arms closed lovingly around us
 Scarce have grown cold,
 When to the scene in which thy coming found us
 We wake ; once more recalled, once more, as when
 We laid life down we take it up again
 And trudge beneath our burthens as of old,
 Thou and thy fair fantastic world being fled.

Yet, evermore in happiness or sorrow,
 In health or sickness, trusting thy strong wing
 To bear us to the threshold of the morrow ;
 From Night's still unaccomplished hours we borrow
 The comfort of new hopes which dawn may bring.

Thus safe across the dreary gulfs that sunder
 The realm of Day we pass, by thy kind care ;
 And if some cloud, lit by the lightning's glare,
 Or rent in pieces by the crashing thunder,
 Wakes the deep-slumbering Earth to trembling wonder
 And frights thee hence, how anxiously we stare
 Out through the gloom, aghast, not knowing where
 Thy startled flight hath left us ; for a space,
 Held by the lingering spell we have been under,
 We see a world in which we have no place ;
 As though both Life and Death by some strange blunder
 Had fallen away and left us lonely there.

The soul thus dallying on Life's farthest edge
 Not having stepped across Death's wavering line,
 Leaving its house with Life as if in pledge
 Of sure return, slips down the shimmering ledge
 Whose yielding sands with unknown jewels shine,
 And out upon the sea — which like a wedge
 Divides two worlds and far out-flowing laves
 Oblivion's shadowed coast with soundless waves.

There with thee drifting, in thy shallow boat
 Beneath thy up-stretched wings, which fan the air
 With fragrant downy plumes, once more we float
 Forgetful of this life that is so fair,
 But where each blooming path by Death is haunted,
 And where the burning hopes so often vaunted
 Soon smolder in the ashes of despair,
 And if they live again, some other-where,
 No heart, however fearless and undaunted,
 Can surely know ; — No mortal hand may dare
 Point out the road by which we shall come there.

But when upon thy tranquil breast reclining
 No more we care if life hath used us ill
 Or if for rain the summer fields be pining
 Or if fierce winter scourge the naked hill ;
 Nor if dark clouds have quenched the moon's fair shining
 Nor if the heart which loved us, loves us still.

And when at last Life will no longer stay,
 But turns aside all heedless of our calling,
 And we can go no farther on the way,
 Because the great abyss, deep and appalling,
 Gapes widely in the darkness for its prey —
 Then, whether night be come, or — slowly falling —
 The twilight shadows of the evening gray,
 Or some last dawn our swimming sight forestalling,
 Or if the time be some fair summer day —
 It hinders not thy coming nor thy care :
 Kind first, last friend, thou wilt not leave us there.
 Nay, lovelier seeming then, dear angel Sleep,
 From thine abode, — where Death and Silence keep
 Watch on thy going, — down the cloud-built stair,
 On thy last journey thou dost softly creep :
 Thy cup of balm clasped in thy hand, to steep
 Our anxious spirits — as of old — in rest.
 Once more, upon the pillows of thy breast.
 But from his gloomy hail the black-robed king
 Steps hastily and halts thee in thy flight.
 And while his presence overawes thy sight :
 The poisoned jewel drops within thy cup.
 And when we drink, our fainting spirits yearn
 For thy soft bosom where we fain would cling
 To rest forever from our wandering :
 Once more thy strong arms lift us gently up,
 Once more the world fades out, and soon the light
 Of worlds unknown and fabled suns that burn
 Far off beyond the farthest star of night,
 Breaks on the planes of thy space-cleaving wing.
 So we go hence and never more return.

Robert Burns Wilson.

TOPICS OF THE TIME.

Soldier and Citizen.

GENERAL J. D. COX, in writing of the policy of the War Department in 1861 of retaining the old organizations of the regular army instead of assigning its officers to command volunteer regiments, has recently said :

"Less than a year afterward we changed our policy, but it was then too late to induce many of the regular officers to take regimental positions in the volunteer troops. I hesitate to declare that this was not, after all, for the best; for, although the organization of our army would have been more rapidly perfected, there are other considerations which have much weight. The army would not have been the popular thing it was, its close identification with the people's movement would have been weakened, and it perhaps would not so readily have melted again into the mass of the nation at the close of the war."*

Herein is recorded one of the chief glories of the Union veteran. Like Grant, he was without any liking for war. His enlistment was for a definite purpose and as a solemn duty, its term being in most cases for "three years or during [not *after*] the war." He never had any doubts as to what he was fighting for, and when that object was accomplished, so far as it could be accomplished by his musket, he came home rejoicing as from exile and without resentment, and looking upon himself *not as a soldier whose duty it was to vote, but as a citizen whose duty it had been to fight.* His theory was that he came back to be part of a restored civil government, and not of a perpetual standing army. Valuing peace thus highly, it is natural that he should have become the chief of peacemakers. The distribution of the military element into the employments of ordinary life was a hardly less wonderful phenomenon than its composition from the farms, offices, and workshops of 1861. In a few months these men became again an integral part of our civil life, abreast of their fellows in the pursuits of peace. This recuperation from the ravages of war and absorption into the life of the citizen, was naturally even more noticeable in the South, which has since given not inferior evidences of forbearance and good citizenship.

Since the war the country has owed much to the Union veterans for services in many capacities—as Presidents, Governors, Senators, Representatives, and in other stations to which a grateful people has elevated them. It was natural that they should receive honor and distinction; moreover, so long as there could possibly be any doubt of the faithful acquiescence of the South in the results of the war, it was natural that, in a political point of view, they should receive special consideration and exercise special influence as a class. Individually, such will doubtless be the case for years to come, but there are distinct evidences that as a factor in the politics of the future the "soldier vote," in the mass, is likely to play a less important part. Such an event will be fortunate for their fame and for the country. The traditions of the veteran will always be held in honor, and the story of his deeds in the greatest war of modern times—one of the few moral and necessary conflicts of arms—will never cease to be a cherished part of our

* Article on "War Preparations in the North," in "Battles and Leaders of the Civil War."

literature. But it is as true as the equation of action and reaction, that the soldier vote must disappear with the conviction on the part of the veterans that their cause, the cause of national unity,—which all now clearly see to have been the cause of human progress,—is no longer in danger. Many came to this conclusion years ago; the man who does not admit it now must be deficient either in intelligence or in candor. For what sentiment of alarm can exist in the presence of the reiterated expressions of loyalty and patriotism which have been heard from all parts of the busy South within the past three years,—a sentiment which even the burning discussion of the disposal of the battle-flags has not served to diminish in the least! With some opportunity of knowing the feelings of Southern soldiers on this subject, we believe that they are expressed in the fullest measure by the speech of Colonel Aylett of Pickett's division at the memorable meeting of Union and Confederate veterans on the battle-field of Gettysburg last July. "The flags which have been won," said he, "are yours, and what is yours is ours; we have made them lustrous with American heroism. Keep them, return them, destroy them, as you will." The cordial feeling on the Union side was not less noticeable. To take a true measure of the importance of such reunions (and this is but one of scores) the reader has but to fancy how impossible their counterpart would be twenty-five years after the battle of Sedan between survivors of that memorable field. No, it would be unwise to send back the flags in a body so long as their voluntary return by the separate commands who took them thus widens the area of inter-sectional good feeling.

In the face of these multiplied evidences of a Union restored in sentiment as well as in fact,—and it was surely for the larger and truer Union that the Northern soldier fought,—we hold that the man who attempts to revive or trade upon the dead issues of the war should be regarded as a public enemy, to be held in deeper contempt than an ordinary disturber of the peace as his offense is more far-reaching and his motives more deliberate. There can now be no motive for sectional feeling that is not personal, partisan, or mercenary, and we believe that recent events indicate that the public is in no mood to tolerate its revival, whether exhibited in the cant of ambitious party leaders, in the public bad manners of political boycotters, or in the adroit and interested flattery of pension agents. Not the least of the reasons why the veteran should disavow this misuse of his honorable history is that the ultimate object of all such class movements is to distract public attention from the evasion by political parties of their real business and their only reason for existence,—namely, to take a definite stand on questions of the day, to the end that the public will have through them an unmistakable expression in the guidance of the government. Any other conception of party is a farce and a delusion, under which the purposes of the party managers and not those of the voters become successful. This tergiversation of parties can measurably be reduced by the completer fusion of the soldier element, as well as of every other class,

with the great body of citizens. The endeavor to play the veteran as a pawn in the political game is one which may well excite his indignation, since it degrades that which should be his highest honor.

It would result in an enormous service to the country if the men who fought for the preservation of the Union would ask themselves whether their work is complete,—whether, unapproachable as is our system in theory, it is, as administered, the model which they would be satisfied to hand down to posterity. Let veterans who are properly sensitive in regard to the *cause*, be sure that also they do not fail to cherish the *memory*, of their victory. Many evils menace us—far too many for us to waste our energies in combating fancied ones. What has been preserved by the war, fundamental as it is, is merely the possibility of a continuously great and happy nation. Constitutions and laws “can only give us freedom”; it is the use we make of this freedom that will determine the value of our national life and its place in history. The Union, therefore, will have to be saved over and over again, first from one danger and then from another. Just now it needs very much the help of the best thought and energy to save it from “the mad rush for office” which has wrung despairing cries from our later Presidents. At this most critical stage of the Merit System,—the stage of partial success,—and when special efforts are making to array the veteran element against it, one may bespeak for it the thoughtful consideration of those who gave their best years that “government of the people, for the people, and by the people should not perish from the earth.” We regard the complete reform of the civil service as the cause of the people, and as the reform before all others, since it is the reform of the machinery by which other reforms are to come. So long as the personnel of the executive and legislative service is in the control of party workers, the expression of the people’s will is in the control of partisan conspiracies, backed, as they always are, by the capital of vested interests. Have our people not already suffered enough on this score? Let veterans consider whether they will lend their influence to the impairment (even, apparently, in their own favor) of a system which substitutes for the will of the party henchman an equitable test of fitness for that part of the civil service which properly has no more relation to party policy than has the regular army.

Personal Records of the War.

AS one who has attempted to settle a disputed point of war history or to construct a map of an engagement knows how desirable it is to have the fullest consensus of evidence in order to establish the smallest circumstance. The official records are invaluable and in themselves compose a large part of the history of the war. But they are far from justifying the blind faith with which they are appealed to in some quarters. Who, from the unassisted reports, would be able to reconstruct the character, the *endings*, of Grant, or McClellan, or Hooker, or Lee, or Jackson, or Hood?—and yet, in war, the personal equation is everything. Moreover, the official records are often inconsistent with themselves, because they are not free from human imperfections and the bias and exaggerations of the moment; and they will therefore acquire a larger

and such history would be like adding it recently the most conservative government in the world.

value as time goes on from comparison with the often more candid and circumstantial diaries and letters of the time and even with general recollections. In the preservation of extra-official history much has been done by the veteran organizations and historical societies—on the side of the South (where many data remain to be supplied) by the Missouri and Virginia Southern Historical Societies, among others; in the North notably by the Soldiers’ and Sailors’ Historical Society of Rhode Island and by the Boston, Philadelphia, Cincinnati, and other Commanderies of the Loyal Legion. It would be well if these bodies could add the important function of editing to those of collecting and publishing historical data. This could often best be done locally, by comparing the concurrent testimony of the survivors of each regiment in the neighborhood in which it was recruited. In this way it may yet be possible, by the aid of letters from the field, to sift out errors and to establish a body of historical evidence concerning the regiment which will have authority in the verdict of the future. The regimental record is, after all, the unit of army history. Happily regimental and State pride have produced a considerable body of this writing. But no veteran should consider himself released from the service until he has made the most accurate record possible of what he saw and knew. The large number of such manuscript narratives which we have received in the past three years, and which lack of space and the topical plan of our series have made unavailable, have included many of importance as cumulative or direct evidence. This material, carefully edited, and prefaced by a schedule of the subject-matter, may well be deposited with the archives of some historical society where in years to come it will be accessible to those students who will take the trouble to examine and weigh it. We have already presented to our readers many important narratives of the military events of the great struggle, written by privates and officers on both sides. We are now about to take a broader look at the War for the Union from another point of view,—through the kindly eyes of him who wisely directed its policy, and whose principles triumphed to a fuller nationality. From the story of the man in the ranks to that of Abraham Lincoln let no true record of the contest perish and no lesson of it be lost to the new, united nation.

The Last Hope of the Mormon.

THERE comes a time, in pitched battle, when one of the two opposing lines begins to show those signs which, to a military eye, indicate failing energy and a readiness to give up the struggle. The charges which have hitherto been rapid, successive, and resolute are succeeded by an inexplicable pause and a wavering of the whole line; or the crowning charge, on which the eyes and hopes of the whole line have been fixed, becomes slower and slower in its advance until it halts irresolute; or the last reserves are hurried into action, without increasing the energy of the defense. It is at such an instant that Waterloos and Gettysburgs are lost and won; and the indications are that such an instant has come at last to the Mormon hierarchy.

No warfare has been more intolerable to the American people than that which its Government has been compelled to wage for years past on the so-called re-

ligious system known as Mormonism. For the warfare has never been directed against any tenet which could in fairness be called religious. The Mormon has as much constitutional right as any other American citizen to found his faith on Mormon, Moroni, Lehi, and the rest of the tribe, to look with reverence to the hill of Cumora, and to govern his practice by the revelations of any leader who pleases him. The American Government has never attempted or desired to interfere with this right. But, when the practice inculcated by the revelations is criminal by the laws of the land, equal-handed justice to the non-Mormon citizen demands that the Mormon be compelled to obey the laws, as others are compelled to obey them, or to find another land which will allow him superior privileges. Such a government is responsible to God, to history, to international public opinion, and to the opinion of those who make the laws, but not to the Mormon, any more than to any other law-breaker. The influences which admittedly control the Government's action may produce a modification or repeal of the law; but, so long as the law exists, the Mormon must obey the law of the land in which he condescends to live.

It has thus been necessary, not for religious but for political reasons, that the Government should wage active warfare upon action which Mormons have claimed to be an article of faith and practice. And as the mass of the Mormons reside in a Territory, which is under supreme control of the Congress of the United States, the penal laws have been stringent and severe. It has been possible, and in the judgment of Congress necessary, to disfranchise the whole body of Mormons, as well as to punish any detected case of bigamy or polygamy. Such a course, involving the refusal of self-government to so large a community, and the retention of Utah as a Territory instead of a State, for an indefinite time to come, is abhorrent to every political instinct of the American people; and many of them have been inclined to doubt the wisdom of the whole policy. To such, it must be reassuring to note the symptoms of yielding which mark the attempt to put Utah before the coming Congress as an applicant for admission as a State.

On the first day of July last, a constitutional convention met at Salt Lake City. The official representatives of the two national political parties in the Territory unite in declaring that the convention represented only the Mormon Church, and their assertion has never been denied. The presiding officer of the convention admitted, with general agreement, that "previous obstacles to the admission of Utah must be faced frankly"; and this is the "frank" manner in which the Mormon Church proposes to face them. Provision for the punishment of bigamy and polygamy, even without State legislation, is made a part of the State constitution, and the repeal of this provision is forever forbidden, without the present assent of Congress. This, in brief, is the Mormon solution of all the difficulties which lie in the way of the admission of Utah as a State.

The solution is not altogether novel, nor was the success of it in its most prominent application such as to give very hopeful anticipations for the present proposition. After it had been decided, by the Compromise of 1820, that Missouri should be admitted as a State, an examination of her proposed constitution showed

that she refused to free negroes the rights given to them in other States. All the excitement which the Compromise had allayed was renewed; and it was with the greatest difficulty that another Compromise was adopted, admitting Missouri, on the fundamental condition that the inchoate State should pass just such a "public and irrevocable Act" as Utah proposes, agreeing never to construe or to execute these provisions of the State constitution so as to bar free negroes from the right of entrance to the State. In June, 1821, the legislature assembled and passed the Act required, with a preamble long afterward stated by Senator Douglas as follows:

"Whereas, Congress has prescribed these terms as the only condition on which the State of Missouri can be admitted to the Union on an equal footing with the original States; and Whereas, the said terms are in palpable violation of the Constitution of the United States, and grossly insulting to the people of this State, and such as Congress had no right to pass and as the people of this State ought not to accede to; and Whereas, the people of Missouri do not intend to respect or be bound by the said conditions, or to acknowledge the right of Congress to impose them; but inasmuch as we cannot obtain our constitutional rights in any other mode than by giving our assent to the same, with the protest that we shall not respect them: Therefore, be it known that we, the people of Missouri, do declare by this fundamental and irrevocable Act," etc., etc.

The State was declared admitted, by President Monroe's proclamation of August 10th, 1821, but, remarks Douglas, the President took good care not to publish the terms of the "public and irrevocable Act" of Missouri.

If the establishment of bigamy or polygamy, as a legal relation, depended upon the positive action of a State legislature, one might see some force in the proposed "public and irrevocable Act" of Utah; but, even then, the preamble of the Missouri Act should be added to it in order to reach its full significance. But, in the Utah case, no positive action is needed; the State authorities need only take a negative position, and do nothing, in order to give the Mormon Church all that it wants; and no State constitution can bind State authorities to do anything which the mass of their constituency support them in refusing to do. It is evident, then, that the plan of a fundamental condition, worthless as it has proved in practice, would be a mere farce in the case of Utah.

But what more can Utah do? This proposition is not only the last hope of the Mormon; it is our last hope of getting anything from him, for he can do no more at present. It is true that he may repent and do works meet for repentance; but are we to keep this miniature Ireland on our hands until we are satisfied of his repentance? How many years can we afford to wait? And after all, when we become satisfied as to his repentance and admit Utah as a State, what are we to do if we find that his repentance was feigned, and he is still really unregenerate! He will then in his legislature have complete control of the subjects of marriage and divorce, and of all offenses connected therewith.

The fact is that every new development only adds force to the belief that the only solution of the question is in making bigamy and polygamy Federal, not State, offenses. When this subject of marriage is transferred to Congress, then, and not until then, will it be *safe* to admit Utah as a State. Until then, the Federal Gov-

ernment cannot solve the problem, and must keep Utah under tutelage as a Territory; until then, the Mormon himself can give us no assurances which a man of ordinary prudence would be justified in accepting. From the latter point of view, this proposition of the Mormon Convention, encouraging as it is in its indications of weakness, is even more important in its warnings of the future. The crisis of our battle has come, and it finds both parties stalemated; the successful line cannot win the battle, and it is just as impossible for the conquered to lose it. We have now come to the end of discussion, under present conditions.*

The Jury System.

SCARCELY any other wheel of our political system is in such constant motion as the jury system. From the little country court-room, where a petty jury sits to decide a matter of debt or ownership of property, to the crowded city hall, where a jury sits to decide on the facts in the prosecution of a great criminal for murder or fraud, or on the existence of a great corporation, juries, in all degrees of importance, are at work on every calendar day of the year. Remove this one wheel suddenly from our system, and every other wheel would run whirring to a stand-still. Even though an entire removal of it be impossible, any influence or set of influences, which tend to sap the power of the jury system, is evidently at work on all the rest of the system, and may bring with it results which are quite impossible to measure.

The English jury has gone through many and fundamental changes from its original form until the present day. Originating in the Teutonic notion that all disputes between man and man were to be decided by the popular meeting, before which each disputant brought his "suit," his following of friends and supporters, the deciding body, was gradually reduced to a definite number, selected from the citizens who made up the popular body. But this "jury" was carefully taken from the "vicinage," from the immediate neighborhood of the seat of the dispute, and was composed of men who were presumed to have complete knowledge of the circumstances, and to decide the dispute from antecedent knowledge. When this condition had become an evident failure, outside persons, the modern "witnesses," were added, with the power of imparting their knowledge to the jury, but not of taking any part in the ultimate decision. As this new feature became more firmly established the antecedent knowledge of the jury became antagonistic to the general system, and the law was slowly settled that the juror who had antecedent knowledge could only use it as a witness. This was diametrically opposite to the original notion, though the forms and purpose of the jury were generally preserved. But from that time, whatever the law may say, the fact of antecedent knowledge has been an objection to a juror: he who knows anything of the facts of a case in advance may be a good juror, but the law is against him. Confronted for one side or the other, or for both sides, regard his appearance as an intrusion if not a gross injustice; and the court is sometimes forced to bring in its whole force in order to prevent as a juror a man who has knowledge and an

intelligent opinion, but can nevertheless give a verdict on the weight of evidence.

How is this feeling to be reconciled with the existence and characteristics of the modern newspaper? The reconciliation might be possible if a criminal could be caught, the legal machinery set in motion, and a jury empaneled, within twenty minutes after a crime had been committed. But, in the natural course of events, the newspaper is weeks, months, even years ahead of the law. It spreads before all the world the facts, colored and uncolored, which are to be in dispute in the coming trial. The citizen who desires to be exempted from the troublesome jury service has only to read the newspapers with assiduity, to form an opinion and to express it in good set terms when summoned as a juror, and his object accomplishes itself. Thus the system, instead of a school of instruction, has become a corrupter of citizenship. It might be made a means of teaching the citizen a lesson which would be of the highest service to the State in all his relations to it and to his fellow-citizens,—the lesson that an intelligent and reasonable man may and should hear statements of fact, and still be able to hold his final judgment so far in abeyance as to take into the balance any new evidence which may be offered. This is to be not only a good juror, but a good citizen, a good politician, and a good member of society in all its relations. The man who, when examined as a juror, states with regret that he has read the newspaper accounts of the case, and has formed an opinion which is too strong to be overcome by evidence, ought to receive a public rebuke from the court, and be sent from the court-room to read, in his newspapers of the following day, the record of this rebuke. If exemption on this ground must come, let it come in this shape, and it will be the less longed for.

But the more serious danger is in the administration of our cities. It has come to pass that more than a fourth of the American people dwell in cities; and the percentage is increasing. Inefficient, slovenly, or fraudulent methods in the preparation of the lists of citizens from which jurors are to be chosen come in with bad city administration, and they constitute an influence which, acting directly on the jury system, acts indirectly on the whole political and social system of the United States. Even a tolerably good administration in other respects could never keep pace with the increasing dangers which city life tends to array against the jury system. The conditions are no longer the same as those under which the jury was born and bred; the locality is no longer one in which everybody knows his neighbor, and can tell whether the person summoned as a juror is lying or speaking the truth; the nearest neighbors in a city may know nothing of one another, and the statement of opinion on the examination of possible jurors has been very much released from the control of public or social opinion. Under these circumstances, that part of city administration which deals with the enrollment of citizens liable to jury duty can no longer be simply tolerable: it must be the best, the most intelligent, and the cleanest feature of the city government. How far this department of American city governments answers these requisites may be learned from any city lawyer in active practice.

Lawyers, however, do not like to say anything on the subject. The lawyer who has lost a case by reason

*The Topics of the Time. THE CENTURY for September and October, 1890.

of a jury's incompetence or faithlessness, would not wish to bear the additional odium of seeming to throw the responsibility upon the jury: it is better to say nothing. It is not safe, moreover, for one man in active practice to get the ill-will of a debased system, and he will prefer to take his chances another time. The judges alone are in a position to do the state this service. When they speak, the public listens; the newspapers direct public opinion to the exact point of the evil; and the whole system feels the influence. It is hardly possible to overestimate the weight with which the sharp words of a competent and respected judge come to the public intelligence and conscience, or the service which he thus does for the whole political system.

If these conclusions are correct, the judiciary is the key to the whole difficulty. The judge can hold the citizen to his duty as a jurymen, can hold the city authority to its duty as an enrolling power, and can direct public opinion in the punishment of any dereliction on either side. The dangers which surround the jury system in this country, then, are another lesson to impress us with the necessity of obtaining good judges. Whether they be appointed or elected, the citizen who feels that their character is no concern of his, that he never expects to go to law and has no interest in the selection of judges, and that he may allow the political prostitution of the judiciary to pass without a protest, may as well understand that he is aiding to corrupt the very springs of our social and political system. For the influence of the judges on the selection of juries is vital to more than this one feature of our governments; the distinct failure of our jury system would indicate a political degeneracy of which no man could see the end.

Shall Immigration be Restricted?

HARDLY any other change of feeling and expression in the American people is more significant of the entrance of a new political era than the rising and already very general demand for some restriction of immigration. From the beginning of English colonization in North America until now, the feeling has been diametrically opposite; the material gains from immigration have been paraded in books and speeches; the more sentimental influence of the country's almost unique position, as the natural refuge of the down-trodden and the oppressed of every clime, has come in to reinforce the material arguments; and the occasional outbursts of Know-nothingism have served mainly as a background, to set off and bring more plainly into view the general and fixed popular aversion to any restriction upon the right of immigration.

In this feeling, also, the future historian will probably find an explanation of a large part of the process which led up to our civil war. Immigration affected the North and West almost exclusively. There were Macs and O's, Vons and Des, both North and South, and in both armies; but there was this great difference: in the North and West they were the product of a comparatively recent immigration, while in the South they were the really native product of two centuries of a far slower immigration. Even in 1880, excluding Florida and Texas, the South had a foreign population of only about two per cent., and that, too, after slavery had ceased for fifteen years to oppose its silent but almost impregnable barrier to immigration. Between 1847

and 1861, the North and West had received an influx of foreign-born population amounting to nearly half the aggregate population of the seceding States. Whatever feeling this new Northern and Western population had was for "America": it had neither comprehension of nor sympathy with the intense loyalty to a State begotten by decades of common trials and the traditional reverence for the State's supreme power; and the influence of this new element could not but affect popular opinion and the action of public men at almost every critical point in the history of those pregnant years. The Carolinian of 1780 and 1860 were very much the same; the New Yorker of 1860 and 1780 were very different beings. The North and West were constantly changing and developing, while the South was standing still; and the result could hardly have been anything but a rupture in the end, even though it had not been forced in 1860-61.

But now it is from the North and West that this cry for restriction of immigration is coming; the South is neutral or indifferent, for it has little interest in the matter. Sectarian differences have little to do with this new phase of the demand. The very immigrants of 1847-61 are now the leaders in urging that the bars be put up, at least for a time; and the restrictions on Chinese immigration stand as a precedent and a tempting suggestion. The Protectionist, who has taken the "protection of American labor" as a conclusive argument, begins to think that "a tariff on Castle Garden" is a necessary corollary to the argument. His natural opponents, more intent on securing individual freedom than protection for the workman, see with disgust that the individual workman is subjected to a tyranny of selfish imported stupidity. The sober, work-a-day citizen, compelled to stop his work and listen to the ravings of an imported mob, whose natural platform is Drink, Dirt, and Disorder, begins to wonder whether he has really been given the providential mission of bearing with this scum. And the tax-payer begins to feel some concern when he finds his country regarded as a preordained poorhouse by every local board of magistrates from Ireland to Hungary. Protestants of every sect hurried forward to resist the tide of Native Americanism when sectarian passion was its moving force. But where are we to look for a voice which will be raised against the coming attempts to restrict immigration, impelled by the notorious happenings of the past two or three years? The system of unrestricted immigration, which was so lately the standing refuge of every Fourth of July orator of the North and West, waits only for the first shock of attack, and there will be few to do it reverence as it falls.

The restriction, when it comes, can hardly take any other shape than the requirement of a consular certificate as a prerequisite for passage to the United States, leaving the consuls to the guidance of instructions from the State Department in the performance of their duties. To the returning tourist or business man, to him whose record of previous American citizenship is clear, or to the *bona fide* farmer or workman, whose immigration is as clear a gain to the republic as ever, the consular certificate would be almost a matter of form. To him who cannot read the consular certificate, or sign his name to the affidavit on which it is granted; to him who is merely leaving his own country for his country's good; to him who comes

not as an intending American citizen, but as a subject of a monarchy which the United States Government has proclaimed to be its enemy; to him, who is the known and irreconcilable enemy of society itself,—to all such, the law may easily be so framed as to make the necessity of a consular certification under the instructions given to consuls, a very serious impediment to immigration. It would be impossible, no doubt, for such a law to touch all the objectionable elements which might assail it; but the result would be at least somewhat clearer water than we have been receiving from the old millstone for years past.

The desirability of such a purification of immigration is no more product of a sentimental admiration of cleanliness. Our "dangerous classes" have been increased, of late years, by the addition of a still more dangerous class, one which is amenable to none of the influences by which society has hitherto dealt with the others. Its members are no longer the outcasts of our farms or pastures or other wild lands. But it has found intelligent, well-educated men in the fastnesses of the wild forest; its members have the power and will to work destruction in which the more brute is incompetent; and our civil human elements prevent society from dealing with them in their proper capacity until after they have wrought their evil work. They are in, though not of, the country; and their presence has only added to the responsibility of those men to whom the preservation of the public peace is intrusted. But why should their base of operations be left unattacked?

Why should they be left to draw reinforcements from abroad at all times? Such a restriction on immigration as has been suggested would cut off at least a percentage of their reinforcements; and every chief of police in the United States would feel that, difficult as his task in dealing with this class might still be, it would no longer be an absolutely hopeless one: daylight might be definitely in advance, but it would be daylight at least.

The hardships of the proposition lie mainly in the vision, which the imagination unconsciously conjures up, of United States marshals lining the shores of the great republic, ready to treat as criminal the desire of any immigrant to enter her jurisdiction. But the reality would be far from correspondent with any such spectacle. There would be a few cases of stowaways, when the steamships or sailing-vessels which brought them would be compelled to carry back at their own expense; and then the mere fact of the known restriction would obtain all the good that can ever be hoped from it. Nor is there any constitutional objection to the power of Congress to enact such a restriction. The section of the Constitution, forbidding Congress to interfere with the "migration or importation of such persons as any of the States now existing shall think proper to admit" until the year 1808, carries with it a complete power to interfere in later years. The importation of negro slaves, of Chinese, and of contract labor has already been forbidden; are there not other classes of immigration which yearn for restriction?

OPEN LETTERS.

Christian Union and Baptism.

IN the July number of *THE CENTURY*, an "Open Letter" writer says: "Christian Union, both essential and organic, is greatly retarded because many Christians refuse to accept the plain teaching of God's word, and the conclusions of the highest scholarship regarding the nature and act of baptism. Baptists hold that Christ alone can make laws for his church; and that the Bible is the only rule of faith and practice. They believe that this word teaches with unmistakable clearness that believers are the only subjects of baptism; and that baptism is the immersion of believers." etc.

Now, all the world knows that, in these matters, other Christians hold, and Presbyterians, among others, nearly believe, just what the Baptist represents as the great faith of the denomination,—namely, "That Christ alone can make laws for his church; and that the Bible is the only rule of faith and practice." Therefore, if they differ from Baptists, why? This writer asks. They refuse to accept the plain teaching of God's word? etc. To "refuse to accept the plain teaching of God's word," they must know that teaching. And if, as this writer charges, they believe that God's word does not teach what they practice, as to the mode and subjects of baptism, then they are all hypocrites, acting in opposition to "conviction and conscience." To brand them all the more deeply and darkly, as living in the hapeni-

tent practice of known sin, he says of God's word: "More explicit are its utterances on these subjects than regarding the divinity of Christ, or any article in the orthodox creeds." That is, as he means: "*Believer's baptism*" and immersion—to the exclusion of all other modes and subjects—are more explicitly taught in God's word, than is the divinity of Christ, or any other doctrine! Is this true or not? All other Evangelical denominations accept the divinity of Christ as a teaching of God's word, and hold that it is heresy not to accept it. So clear is the teaching of the Bible on this subject. Now, as this writer says, the baptism of believers only, and immersion as the mode, are more explicitly taught in God's word, than this essential doctrine of the common acceptance and faith, we do utterly and emphatically deny the statement. We affirm that there is not *one verse* in the Bible proving immersion as the only mode of baptism or the only baptism, and not one verse in the Bible proving that only believers are to be baptized, and not one verse in the Bible proving beyond doubt or controversy—that is, in *express words*—that any one was ever immersed in being baptized.

But this writer claims that "all men, always and in all places, accept immersion as baptism; not to accept it, is not to accept baptism."

And we ask: Why is it *recognized* as baptism? (We do not say it is *accepted*,—for that would not be true.) Simply because, thereby we wish to recognize Baptists as an Evangelical denomination, and be-

cause we wish to *respect every brother's conscience in all things doubtful, or not essential*. This, God's word commands.

Good and wise men differ as to the Bible-teachings touching the mode and subjects of baptism. Since these differences are not about "things essential," ought we not to show Christian charity? If it be said that we are disobedient to a plain command of Christ's own giving, we must deny it. We believe that baptism is commanded; and we *believe we obey the command in our mode and subjects*. We believe this more firmly than we believe that the "Baptists" are right! And, certainly, in the Presbyterian Church (South, at least, if not North also) we do not accept nor practice immersion. Some cases of immersion there were, formerly; but, because of our great doubt as to the Scripturalness of this mode, it is now disapproved among us, in practice. Notwithstanding all that this Baptist writer says, we do not "agree on immersion as baptism" for ourselves; and we cannot be immersed "without doing violence either to conviction or conscience."

As to the "highest scholarship," etc., we have good reason to know and say that when writers and others are *fairly and fully represented or quoted*, their "Concessions" to Baptists are worthless, and in many cases merely imaginary. But were it otherwise, we cannot depart from our law, "that Christ alone can make laws for his church; and that the Bible is the only rule of faith and practice." The baptism given in the example of Christ is found in Acts ii. *It is the only case in the Bible where mode cannot be argued at all. It came from above, was "poured" (v. 18) upon the heads of those receiving it.* Not one case of immersion is mentioned in all the Book! This is not the place to argue the meaning of the original word, as used before Christ adopted it. Suffice it to say that neither classic Greek, nor any other, justifies immersion as the one mode; and *the Bible does not justify it at all, in our view!*

We must not conclude without remarking upon the very strange assertion that "the so-called 'Teaching of the Apostles' does not call anything baptism but immersion"; that "it gives directions for baptism, and then, when the conditions for baptism are wanting, . . . it gives permission for something else, not called baptism." In the directions about baptism in that document, *immersion is not once mentioned, nor even hinted at!* Two kinds of water are mentioned; "Living," that is, fresh, or running water, is preferred. "But if thou hast not both (kinds), pour water (the kind thou hast) upon the head," etc. *And this is called baptism, afterwards!* "προ δε του βαπτισματος." No one can read that document, then say truly, "Baptists alone live up to it."

His further claim that "all are agreed on immersion as baptism . . . All can be baptized (immersed) without doing violence either to conviction or conscience," we object to, most emphatically. We have explained why we *recognize* immersion. But for ourselves we cannot conscientiously accept it, nor administer it to others.

Herbert H. Hawes,

Pastor of the Second Presbyterian
Church, Staunton, Va.

Christian Union and Pending Public Questions.

THE discussion which has been maintained of late, in THE CENTURY and elsewhere, on the subject of Christian Union, has thus far established at least these three propositions:

First. That there is a strong and a growing desire for such union—a desire discovering itself among some of the leading ministers of several distinct denominations.

Second. That the Christian union so desired is not only nearer and more harmonious relations between different and still separate churches, but, certainly by some, *an effective organic unity*; not the general absorption of all others by any one, but reunion based on reconciliation of differences or on the discovery of mutually satisfactory terms upon which those distinctive differences can be coördinated.

But, *Third*, that in none of the churches is there felt, as yet, any great motive power pressing them on with sufficient force to overcome either the general inertia or the many and serious practical difficulties and obstacles which arrest actual progress in that direction.

In other words, while many Christian thinkers greatly *desire*, the churches clearly do not, as yet, feel the *necessity* of Christian unity.

Meanwhile, however, it is evident that a question is beginning to present itself, as perhaps worthy of serious consideration, which is nearly allied to this, and which must practically involve this very issue of Christian unity.

From no principle of English social and political life did the revolution separate our fathers more effectively and more thoroughly than from that which recognized an established religion of the State. That the new nation should have, as such, no religion, was assumed to be one of the corner-stone principles on which rested the guaranty of our liberties. So far has this assumption been carried, so widely and continuously has it entered, ever since, into all our writing, speaking, and thinking upon matters of public interest, that it has come to be accepted as a virtual axiom of American social and political philosophy, that religion is concerned only with a personal and private life of the individual; and that it has no natural, much less necessary, relation with social problems and political issues.

This experiment of relegating Christianity to the individual and to private life,—the attempt to conduct business, to develop social interests, to work out an American economic science, and, above all, to administer the affairs of the nation without reference to Christian laws or to Christian principles,—on the ground, that is, that these laws and principles do not apply to the affairs of this life, has, in consequence been tried thoroughly; and there are not a few who are now beginning to look around them, to consider the utter disorganization of our accepted economic system; to analyze and search for the causes of the labor troubles and of the inchoate anarchy of the last few years, of the confessed moral failure of our boasted public-school system, and of the corruption of our politics,—and to ask how far these are the outcome of that experiment.

Without attempting to anticipate the results of such inquiries, it may, at least, be said that they open up before us some of the most serious questions ever pro-

posed to American thinkers and students. They remind us of the plain, direct language of *Testimony to the Nation and Kingdom which will not serve their shall perish*, and they constrain us to consider whether those words be not deserving of a larger and a more modern application than we have been wont to give them.

But this inquiry also brings us face to face with another grave question. If we should be led, eventually, to admit that Christianity is a necessary factor in the settlement of our later troubles, in the solution of the most perplexing problems which now present themselves in sociology and even in public politics, how is it possible to bring this factor into effective action, so long as Christianity presents itself to the public consciousness only in a number of wholly distinct and at least supposedly antagonistic sects and churches? Even were the community to be persuaded of the necessity of taking counsel, in its extremity, of the church of Christ,—who shall or who can decide for the community, from which one of all these several Christian bodies, each claiming to be at least the nearest approximation to the ideal of that church and most faithfully to teach Christian doctrine?—society is to ask, and receive instruction in the oracles of God. Even were the business community ready to accept a new Christian social economy or the nation to conform its public policy to Christian principles, is not Christian reaction a condition precedent of the power of the Church to give such guidance or to teach such principles?

National Christianity, where it still exists, has come down from a period which antedates these divisions among Christians. In a pure monarchy, so long as the ruling family—in an aristocracy, so long as the ruling class, continues to be identified with one organic form of Christianity, so long can that national Christianity be maintained, even after Christian unity, among the people, had been broken up. But, in proportion, as the actual power of government passes into the hands of those who are themselves divided on organic religious issues, in that proportion must such divisions prove fatal to anything like a national Christianity. The exclusion of Christianity from all but purely personal and private interests is, therefore, the inevitable result of Christian divisions in a democracy.

Consequently, then, among us, must the restoration of such a new Christian unity promising all hope of anything like a real social or economic or national regeneration of Christianity; and any one who honestly believes that a new Christian social economy and a new Christian political philosophy have been failures; every one who honestly holds that the great issues which have been raised by the conflicting interests of labor and capital can only be adjusted only on Christian principles; every one who is now ready to admit that a public school system, in accordance with which the intellect only is educated, while the conscience is left undisciplined, is worse than a failure; every one who believes that the attempt to ignore the fact of Christ in national politics is bound to all national prosperity and stability;—all these cases, of necessity, therefore, whatever their personal or private religious convictions or character, must in later seek the restoration of some effective Christian policy.

That the social disturbances of these times and the present state of party politics have brought many to

consider these questions as never before, is not to be denied. That there will awaken and stimulate discussion in the drawing-room, at the table, in the religious press, the magazine and the review, on the platform and in the pulpit, is equally beyond a doubt.

In the process of such consideration and questions the wide distinction, heretofore so generally accepted and so steadily maintained on both sides,—between the domain of public interests and duties and that of personal and personal Christianity,—has away and utterly disappears. The Christian feels himself called upon to consider his relations, as such, to every social question and to every political issue of his time. The economist, the politician, and the statesman find themselves equally called upon to ask what Christianity has to say upon the question in hand, and what modifications are introduced into the problems of the hour, by that which, at all events potentially, if not in actuality, is the overruling factor—the law of Christ.

Secret Societies in College.

THE time has arrived again when the classes are gathering in our various institutions of learning over the land, and many young men are just beginning the new and strange life embraced within those eventful four years which mold and in a great measure fix their after career among scholars and professional associates in the real world outside.

I should like to say a few words about one matter concerning the societies which have place, rightly or wrongly, in most colleges. The process of what used to be called "elective engineering" commences almost at once when the freshmen come on. The secret and the anti-secret associations alike select their members; and so most of the new students are compelled to take sides on a question which grows more and more intricate as they advance in years, and are able to mark the workings of an experience thoroughly unique and prodigiously influential, upon themselves and upon others. The best that can be said at the beginning, and the best that can be urged to the end, is that men should be conscientious at the beginning and consistent to the end of their course.

Let me tell an old true story: When I was in college, it was an admitted custom for the secret-society students to attend at pleasure the regular meetings of the anti-secret association, then called there the Social Fraternity. On one occasion the news went around that the delegates of a number of affiliated institutions had assembled in some central city during the vacation, and formed a *grand* national association, embracing all the local ones, which hereafter were to be understood to have become auxiliaries. Curiosity was at its height, and the assembly convened to accept the report was visited by a large number of outsiders also, and the small chapel was nearly full. Even the "neutrals" dotted their dignity in order to witness the novelty.

The committee proceeded to read their preamble and constitution for a formal adoption. It was in the regular form. It began by saying that the name of the new organization should be the "Anti-Secret Society

of the United States." It then rehearsed the purposes, the aims, and the hopes of the members in thus banding themselves together. The officers were fixed, their duties prescribed, and all that. By and by an article was reached which specified and described, somewhat particularly, the way in which it should be known. Of course I am not going even to try to quote anything more than the substance of the language. It was like this: "The badge of this Society shall consist of a bosom-pin about six-tenths of an inch in diameter, circular, a black disk of jet surrounded by a wreath of gold, bearing in the center the initials of the Society's name in raised letters of gold in the enamel."

Thereupon there was an instant explosion of laughter from one of the visitors — the unfortunate writer of this article. He meant no derision, and indeed was as innocent in his indiscretion as he was mortified by such a disclosure of it. The usual shout, with all its precipitation of student-wrath, was started for his comfort: "Put him out!" He replied with the usual Greek: "Strike, but hear!" Then the ordinary amount of intellect was invoked to perceive that really there was some incongruity in such noble and scholarly men wearing on their bosoms the great golden letters "A S S" before all the college. Anger gave place to fun; and ultimately the convention did their work better by changing the name of the society to Anti-Secret Confederation; and through the rest of our course members were labeled "A S C."

Such a discomfiture would have been fatal in most cases, and inevitably would have given a most unphilosophical advantage to the other side of the question. But the fact was, those men were the chiefs of the college. They had among them some of the maturest and best the classes loved to honor. They managed the rest of the meeting skillfully. Before we retired, they forced in a splendid chance for an appeal to all that was decent and generous in our minds; they stood up in the power of real manhood, and told us the meanness of cliques and the injustice of exclusiveness, and the wickedness of oaths. Some of the Social Fraternity men of that year have done magnificent work in this old world since then; and I speak simple justice when I own they shook many of us that night with their arguments and their truths.

For one, I like conscience when I see it; I always did; and more than that, I like outspoken words for what is right and good and true. But I like consis-

tency also; and now I must tell the rest of my story. On the day we graduated, sobered and thoughtful, gentle and pensive in the backward look and the forward dread, a new secret society, running through all the four classes, "swung out" before the eyes of us all in complete organization. Among the men who spoke their commencement orations in our class were three or four wearing the badge of that association. They were the men who argued and pleaded two years previous to that day in the small chapel. They repudiated their principles and defied their former record, when it was too late for an apology or for an explanation. The Social Fraternity was wounded and betrayed by its leaders in the whole four classes; the secret-society men were not inclined to feel complimented; and the conversation was worried and perplexed, when the young fellows asked and wondered what it meant. Some said that these men had always been shamming because they had not for themselves been taken, and so were spiteful instead of conscientious.

Simply and earnestly I say again, as I close the tale, let those who take ground on this unsettled question of secret societies in college put conscience and consistency together. If any one changes his mind, because of fresh convictions, let him own it frankly, and take a clear stand early enough to retain the respect of those who have loved and trusted him in the days gone by. For I soberly declare that it is my pain to this day to recall how my confidence was broken then.

Charles S. Robinson.

Henry Clay, the Slashes, and Ashland again.

HENRY CLAY was born within three miles of Hanover Court House, south, and some four or five miles eastward of the present pretty little summer town of Ashland. His birthplace was known locally as "The old Clay place," or "The place where Henry Clay was born," and as long ago as 1832, and many years earlier, I believe, had passed into other hands.

The first name of the railway station where Ashland stands was called, in 1836, "Tayler's Sawmill"; then the name was appropriately changed to "Slash Cottage," being in the heart of the Slashes of Hanover. That name held till after 1850, when Mr. Edwin Robinson, of Richmond City, conceived the project of building a town at "Slash Cottage," and formally christened it "Ashland," after Mr. Clay's residence in Kentucky.

W. A. W.

THE TWO MEN.

Yousen, Biggerlow considered his best method for the effect of his line, a phraser, "In the Measure." His rich uncle has come to consider Biggerlow. "Wash now, I guess we can make a dicker on that phraser, 'proven' you are set up them cows and turn 'em downers." "Then please, then, then, and you a phraser of words, 'proven' is in place of one, and with the name of our name in big and many names the way, and I very fully set."

Aphorisms from the Quarters.

Where some folks start out preaching, the rest of the playin' a hymn on the house.

De water-mill, you know a taller house than the river-bank.

He says to the man, don't get much 'lection on 'lection day.

He says to the man, don't get much 'lection on 'lection day.

More folks like 'lection on 'lection day.

Remember, don't take the trouble to get well.

De water-keeper's long prais ain't no sign of a long yardstick.

When de water-keeper's long prais ain't no sign of a long yardstick.

That water-keeper's long prais ain't no sign of a long yardstick.

That water-keeper's long prais ain't no sign of a long yardstick.

CLATTER is de new bell shine in de dark.

De apple in de rabbit-trap is rank poison.

J. A. Maen.

Ballade of the Romantic Poet.

AH, Poet, you are out of date!
 You "sing" and live in "faery-land";
 You warble love; a laureled pate
 Is all the profit you'd command:
 But vain! — a reader's vex'd, unmanned
 At cantos all of "lute" and "lance": —
 None heed to-day, though perfect-planned,
 The rippled rhyme of old Romance.

These analyze for hint of fate:
 The Age, the Life on every hand;
 Make ditties out of real estate
 And verse on geologic sand.
 What though of Roncesvalles' band
 One blew a ballad over France? —
 This age progresses: — dead! who scanned
 The rippled rhyme of old Romance.

Leave Roland at the Tower gate;
 Write odes to Autumn fruitage — canned;
 With Locomotive sonnets sate
 "The heavy Spring and Fall demand."
 Ah, Poet, once were ladies bland,
 And woods enringed with Satyr dance —
We learn too much to understand
 The rippled rhyme of old Romance.

ENVOY.

But hearken! though the time be fanned
 With torrid airs of change and chance;
Some love the shade, the magic-wand,
 The rippled rhyme of old Romance.

Harrison S. Morris.

Revision.

I WROTE some lines, from end to end
 In praise of dearest May.
 I showed them to a critic friend,
 To see what he would say.
 "They're crude," said he, "and so are you."
 (He was a grouty fellow!)
 "Just let them lie a year or two,
 To ripen and grow mellow.
 "Go over them from time to time,
 And polish bit by bit;
 Perfect the meter and the rhyme,
 And sharpen up the wit:
 "In half a year, but for the theme,
 And for the lady's name,
 They'll be so changed you'll hardly dream
 The lines could be the same."
 I let them lie, I worked them o'er, —
 Changed epithet and rhyme.
 I hardly knew them any more,
 They'd mellowed so by time.
 "Black eyes" had mellowed into "blue,"
 And "ringlets" into "strands";
 "One dimple," ripened into "two";
 "Small," grown to "shapely" hands.
 And what was once "*nez retroussé*"
 Was now a "*Grecian*" nose;
 In fact, the very name of "*May*"
 Had mellowed into "*Rose*."

Esther B. Tiffany.

An Old-fashioned Girl.

OLD-FASHIONED? Yes, I must confess
 The antique pattern of her dress,
 The ancient frills and furbelows,
 The faded ribbons and the bows.
 Why she should show those shrunken charms,
 That wrinkled neck, those tawny arms,
 I cannot guess; her russet gown
 Round her spare form hangs loosely down;
 Her voice is thin and cracked; her eye
 And smile have lost their witchery.
 By those faint jests, that flagging wit,
 By each attenuated curl,
 She surely is, I must admit,
 An odd, old-fashioned girl.

'Tis long, long since she had a beau,
 And now with those who sit a-row
 Along the wall she takes her place,
 With something of the old-time grace.
 She yearns to join the mazy waltz,
 And slyly sniffs her smelling-salts.
 Ah, many an angel in disguise
 May walk before our human eyes!
 Where'er the fever-smitten lie
 In grimy haunts of poverty,
 Along the dark and squalid street,
 'Mid drunken jests of boor and churl,
 She goes with swift and pitying feet, —
 This same old-fashioned girl.

James B. Kenyon.

The Missing Glove.

CLARINDA's ball is almost o'er;
 Her long gloves hang upon her arm;
 Perchance her shapely hands are warm
 While still she lingers at the door,

Speaking to one whose dark eye burns
 Too deep, I fear, into her soul.
 (I pray she keep her fancy whole.)
 The moments fly; at last she turns,

And soon among her parting guests
 "I've lost my glove," she starting cries:
 To find it first each gallant vies.
 The maiden, blushing, now requests

The search be stopped — "'Tis no account;
 'Twill soon be found!" They take their leave.
 Clarinda is not one to grieve
 O'er ills past help; she turns to mount

The stair and gains at last her room.
 Ah! how a maiden's fancy flies!
 She has, I fear, some sweet surmise
 About her glove, for through the gloom,

Gazing where glowing embers die
 Upon the hearth, she faintly smiles.
 See! dreaming, she undoes the wiles
 Of her silk draperies, and they lie

Fallen at her feet; still gazing down,
 She lets her loosed hair to her knee
 Slide heavily; then stoops to see
 What lies entangled in her gown.

Ah! luckless glove, that that quick fire
 Should prove at last thy funeral pyre!

Winifred Howells.
